Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.452.3.6 virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.452.3.7 virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.453.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2185). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.453.2 Constructor & Destructor Documentation

6.453.2.1 `activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::RemoveInfoMarshaller()` [inline]

6.453.2.2 `virtual activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::~~RemoveInfoMarshaller()` [inline, virtual]

6.453.3 Member Function Documentation

6.453.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.453.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.453.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.453.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.453.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.453.3.6 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.453.3.7 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

6.454.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2189). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.454.2 Constructor & Destructor Documentation

6.454.2.1 `activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::RemoveInfoMarshaller()` [inline]

6.454.2.2 `virtual activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::~~RemoveInfoMarshaller()` [inline, virtual]

6.454.3 Member Function Documentation

6.454.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.454.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.454.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.454.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.454.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.454.3.6 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.454.3.7 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

activemq::commands::RemoveSubscriptionInfo::~~RemoveSubscriptionInfo () [virtual]

6.455.2 Member Function Documentation

- 6.455.2.1** **virtual RemoveSubscriptionInfo*** **activemq::commands::RemoveSubscriptionInfo::cloneDataStructure** ()
const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

- 6.455.2.2** **virtual void** **activemq::commands::RemoveSubscriptionInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.455.2.3 virtual bool activemq::commands::RemoveSubscriptionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.455.2.4 virtual std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () [virtual]**6.455.2.5 virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () const [virtual]****6.455.2.6 virtual Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () [virtual]****6.455.2.7 virtual const Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () const [virtual]****6.455.2.8 virtual unsigned char activemq::commands::RemoveSubscriptionInfo::getDataStructureType () const [virtual]**

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.455.2.9** `virtual std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName ()`
[virtual]
- 6.455.2.10** `virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName ()`
`const` [virtual]
- 6.455.2.11** `virtual bool activemq::commands::RemoveSubscriptionInfo::isRemoveSubscriptionInfo () const` [inline, virtual]

Returns:

an answer of true to the `isRemoveSubscriptionInfo()` (p. 2196) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 511).

- 6.455.2.12** `RemoveSubscriptionInfo& activemq::commands::RemoveSubscriptionInfo::operator=`
`(const RemoveSubscriptionInfo &)` [inline, protected]

`(const std::string & subscriptionName)` [virtual]
- 6.455.2.16** `virtual std::string activemq::commands::RemoveSubscriptionInfo::toString ()`
`const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 512).

- 6.455.2.17** `virtual Pointer<Command> activemq::commands::RemoveSubscriptionInfo::visit`
`(activemq::state::CommandVisitor * visitor) throw (`
`exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.456.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 2198).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.456.2 Constructor & Destructor Documentation

6.456.2.1 `activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::RemoveSubscriptionInfo()` [inline]

6.456.2.2 `virtual activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::~RemoveSubscriptionInfo()` [inline, virtual]

6.456.3 Member Function Documentation

6.456.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.456.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.456.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::marshal(commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.456.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.456.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.456

activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller

Class Reference

2201

```
6.456.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMars
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

    * dataStructure, decaf::io::DataInputStream * dataIn,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

6.457.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 2202).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.457.2 Constructor & Destructor Documentation

6.457.2.1 `activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::RemoveSubscriptionInfoMarshaller()` [inline]

6.457.2.2 `virtual activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::~RemoveSubscriptionInfoMarshaller()` [inline, virtual]

6.457.3 Member Function Documentation

6.457.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.457.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.457.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::marshal(commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.457.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.457.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

```

6.457.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMars
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions:

- IOException* if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

```

6.457.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightUnm
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataInputStream * dataIn,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**RemoveSubscriptionInfoMarshaller.h**

Write a object instance to data output stream.

6.458.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 2206).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.458.2 Constructor & Destructor Documentation

6.458.2.1 `activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::RemoveSubscriptionInfoMarshaller()` [inline]

6.458.2.2 `virtual activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::~RemoveSubscriptionInfoMarshaller()` [inline, virtual]

6.458.3 Member Function Documentation

6.458.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.458.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.458.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::marshal(commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.458.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.458.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

```

6.458.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMars
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

```

6.458.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightUnm
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataInputStream * dataIn,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**RemoveSubscriptionInfoMarshaller.h**

6.459.1 Constructor & Destructor Documentation

6.459.1.1 `activemq::commands::ReplayCommand::ReplayCommand (const ReplayCommand &) [inline, protected]`

6.459.1.2 `activemq::commands::ReplayCommand::ReplayCommand ()`

6.459.1.3 `virtual activemq::commands::ReplayCommand::~~ReplayCommand () [virtual]`

6.459.2 Member Function Documentation

6.459.2.1 `virtual ReplayCommand* activemq::commands::ReplayCommand::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.459.2.2 `virtual void activemq::commands::ReplayCommand::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.459.2.3 `virtual bool activemq::commands::ReplayCommand::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.459.2.4 `virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

6.459.2.5 `virtual int activemq::commands::ReplayCommand::getFirstNakNumber () const [virtual]`

6.459.2.6 `virtual int activemq::commands::ReplayCommand::getLastNakNumber () const [virtual]`

6.459.2.7 `ReplayCommand& activemq::commands::ReplayCommand::operator= (const ReplayCommand &) [inline, protected]`

6.459.2.8 `virtual void activemq::commands::ReplayCommand::setFirstNakNumber (int firstNakNumber) [virtual]`

6.459.2.9 `virtual void activemq::commands::ReplayCommand::setLastNakNumber (int lastNakNumber) [virtual]`

6.459.2.10 `virtual std::string activemq::commands::ReplayCommand::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.459.2.11 `virtual Pointer<Command> activemq::commands::ReplayCommand::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.459.3 Field Documentation

6.459.3.1 `int activemq::commands::ReplayCommand::firstNakNumber` [protected]

6.460.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2214). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.460.2 Constructor & Destructor Documentation

6.460.2.1 `activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::ReplayCommandMarshaller()` `[inline]`

6.460.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::~~ReplayCommandMarshaller()` `[inline, virtual]`

6.460.3 Member Function Documentation

6.460.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.460.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.460.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.460.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.460.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.460.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.460.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

6.461.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::~~ReplayCommandMarshaller()` `[inline, virtual]`

6.461.3 Member Function Documentation

6.461.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.461.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.461.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.461.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.461.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.461.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.461.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/ReplayCommandMarshaller.h

6.462 activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2222).

#include <src/main/activemq/wireformat/openwire/marshal/v1/ReplayCommandMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller:

Public Member Functions

- **ReplayCommandMarshaller** ()
- virtual **~ReplayCommandMarshaller** ()

Write a object instance to data output stream.

6.462.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2222). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.462.2 Constructor & Destructor Documentation

6.462.2.1 `activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::ReplayCommandMarshaller()` [inline]

6.462.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::~~ReplayCommandMarshaller()` [inline, virtual]

6.462.3 Member Function Documentation

6.462.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.462.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.462.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.462.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.462.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.462.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.462.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

6.465 activemq::cmsutil::ResourceLifecycleManager Class Reference

Manages the lifecycle of a set of CMS resources.

```
#include <src/main/activemq/cmsutil/ResourceLifecycleManager.h>
```

Public Member Functions

- **ResourceLifecycleManager** ()
- virtual **~ResourceLifecycleManager** ()
Destructor - calls `destroy`.
- void **addConnection** (cms::Connection *connection)
Adds a connection so that its life will be managed by this object.
- void **addSession** (cms::Session *session)
Adds a session so that its life will be managed by this object.
- void **addDestination** (cms::Destination *dest)
Adds a destination so that its life will be managed by this object.
- void **addMessageProducer** (cms::MessageProducer *producer)
Adds a message producer so that its life will be managed by this object.
- void **addMessageConsumer** (cms::MessageConsumer *consumer)
Adds a message consumer so that its life will be managed by this object.
- void **destroy** () throw (cms::CMSException)
Closes and destroys the contained CMS resources.
- void **releaseAll** ()
Releases all of the contained resources so that this object will no longer control their lifetimes.

6.465.1 Detailed Description

Manages the lifecycle of a set of CMS resources. A call to `destroy` will close and destroy all of the contained resources in the appropriate manner.

6.465.2 Constructor & Destructor Documentation

6.465.2.1 **activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager** ()

6.465.2.2 **virtual**
activemq::cmsutil::ResourceLifecycleManager::~~ResourceLifecycleManager () [virtual]

Destructor - calls `destroy`.

6.465.3 Member Function Documentation

6.465.3.1 `void activemq::cmsutil::ResourceLifecycleManager::addConnection
(cms::Connection * connection) [inline]`

Adds a connection so that its life will be managed by this object.

Parameters:

connection the object to be managed

6.465.3.2 `void activemq::cmsutil::ResourceLifecycleManager::addDestination
(cms::Destination * dest) [inline]`

Adds a destination so that its life will be managed by this object.

Parameters:

dest the object to be managed

6.465.3.3 `void ac-
tivemq::cmsutil::ResourceLifecycleManager::addMessageConsumer
(cms::MessageConsumer * consumer) [inline]`

Adds a message consumer so that its life will be managed by this object.

Parameters:

consumer the object to be managed

6.465.3.4 `void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer
(cms::MessageProducer * producer) [inline]`

Adds a message producer so that its life will be managed by this object.

Parameters:

producer the object to be managed

6.465.3.5 `void activemq::cmsutil::ResourceLifecycleManager::addSession
(cms::Session * session) [inline]`

Adds a session so that its life will be managed by this object.

Parameters:

session the object to be managed

6.465.3.6 void activemq::cmsutil::ResourceLifecycleManager::destroy () throw (cms::CMSException)

Closes and destroys the contained CMS resources.

Exceptions:

cms::CMSException (p. 850) thrown if an error occurs.

6.465.3.7 void activemq::cmsutil::ResourceLifecycleManager::releaseAll ()

Releases all of the contained resources so that this object will no longer control their lifetimes.

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**ResourceLifecycleManager.h**

6.466 activemq::commands::Response Class Reference

#include <src/main/activemq/commands/Response.h> Inheritance diagram for activemq::commands::Response:

Public Member Functions

- **Response** ()
- virtual **~Response** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **Response * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual int **getCorrelationId** () const
- virtual void **setCorrelationId** (int correlationId)
- virtual bool **isResponse** () const
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_RESPONSE** = 30

Protected Member Functions

- **Response & operator=** (const **Response** &)

Protected Attributes

- int **correlationId**

6.466.1 Constructor & Destructor Documentation

6.466.1.1 `activemq::commands::Response::Response (const Response &) [inline, protected]`

6.466.1.2 `activemq::commands::Response::Response ()`

6.466.1.3 `virtual activemq::commands::Response::~~Response () [virtual]`

6.466.2 Member Function Documentation

6.466.2.1 `virtual Response* activemq::commands::Response::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

Reimplemented in `activemq::commands::DataArrayResponse` (p. 1102), `activemq::commands::DataResponse` (p. 1133), `activemq::commands::ExceptionResponse` (p. 1277), and `activemq::commands::IntegerResponse` (p. 1443).

6.466.2.2 `virtual void activemq::commands::Response::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

Reimplemented in `activemq::commands::DataArrayResponse` (p. 1102), `activemq::commands::DataResponse` (p. 1133), `activemq::commands::ExceptionResponse` (p. 1277), and `activemq::commands::IntegerResponse` (p. 1443).

6.466.2.3 `virtual bool activemq::commands::Response::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1102), **activemq::commands::DataResponse** (p. 1133), **activemq::commands::ExceptionResponse** (p. 1277), and **activemq::commands::IntegerResponse** (p. 1443).

6.466.2.4 `virtual int activemq::commands::Response::getCorrelationId () const`
[virtual]

6.466.2.5 `virtual unsigned char activemq::commands::Response::getDataStructureType ()`
`const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1103), **activemq::commands::DataResponse** (p. 1134), **activemq::commands::ExceptionResponse** (p. 1277), and **activemq::commands::IntegerResponse** (p. 1443).

6.466.2.6 `virtual bool activemq::commands::Response::isResponse () const`
[inline, virtual]

Returns:

an answer of true to the **isResponse()** (p. 2233) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 511).

6.466.2.7 `Response& activemq::commands::Response::operator= (const Response &)` [inline, protected]

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1103), **activemq::commands::DataResponse** (p. 1134), **activemq::commands::ExceptionResponse** (p. 1278), and **activemq::commands::IntegerResponse** (p. 1444).

6.466.2.8 `virtual void activemq::commands::Response::setCorrelationId (int correlationId)` [virtual]

6.466.2.9 `virtual std::string activemq::commands::Response::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 512).

Reimplemented in `activemq::commands::DataArrayResponse` (p. 1103), `activemq::commands::DataResponse` (p. 1134), `activemq::commands::ExceptionResponse` (p. 1278), and `activemq::commands::IntegerResponse` (p. 1444).

6.466.2.10 `virtual Pointer<Command> activemq::commands::Response::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a `Response` (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.466.3 Field Documentation

6.466.3.1 `int activemq::commands::Response::correlationId` [protected]

6.466.3.2 `const unsigned char activemq::commands::Response::ID_RESPONSE = 30` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/Response.h`

6.467 activemq::transport::mock::ResponseBuilder Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

#include <src/main/activemq/transport/mock/ResponseBuilder.h>Inheritance diagram for activemq::transport::mock::ResponseBuilder:

Public Member Functions

- virtual **~ResponseBuilder** ()
- virtual **Pointer< Response > buildResponse** (const **Pointer< Command > &command**)=0
Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.
- virtual void **buildIncomingCommands** (const **Pointer< Command > &command**, **decaf::util::StlQueue< Pointer< Command > > &queue**)=0
*When called the **ResponseBuilder** (p. 2235) must construct all the Responses or Asynchronous commands (p. 59) that would be sent to this client by the Broker upon receipt of the passed command.*

6.467.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

6.467.2 Constructor & Destructor Documentation

6.467.2.1 virtual **activemq::transport::mock::ResponseBuilder::~~ResponseBuilder** () [inline, virtual]

6.467.3 Member Function Documentation

6.467.3.1 virtual void **activemq::transport::mock::ResponseBuilder::buildIncomingCommands** (const **Pointer< Command > &command**, **decaf::util::StlQueue< Pointer< Command > > &queue**) [pure virtual]

When called the **ResponseBuilder** (p. 2235) must construct all the Responses or Asynchronous **commands** (p. 59) that would be sent to this client by the Broker upon receipt of the passed command.

Parameters:

- command* - The Command being sent to the Broker.
- queue* - Queue of Command sent back from the broker.

Implemented in `activemq::wireformat::openwire::OpenWireResponseBuilder` (p. 1988).

6.467.3.2 `virtual Pointer<Response> activemq::transport::mock::ResponseBuilder::buildResponse(const Pointer< Command > & command)` [pure virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters:

command - The command to build a response for

Returns:

A Response object pointer, or NULL if no response.

Implemented in `activemq::wireformat::openwire::OpenWireResponseBuilder` (p. 1989).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/mock/ResponseBuilder.h`

6.468 activemq::transport::correlator::ResponseCorrelator Class Reference

This type of **transport** (p.67) filter is responsible for correlating asynchronous responses with requests.

#include <src/main/activemq/transport/correlator/ResponseCorrelator.h> Inheritance diagram for activemq::transport::correlator::ResponseCorrelator:

Public Member Functions

- **ResponseCorrelator** (const **Pointer**< **Transport** > &next)
Constructor.
- virtual ~**ResponseCorrelator** ()
- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given request to the server and waits for the response.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given request to the server and waits for the response.
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
This is called in the context of the nested transport's reading thread.
- virtual void **start** () throw (cms::CMSException)
*Starts this **transport** (p.67) object and creates the thread for polling on the input stream for **commands** (p.59).*
- virtual void **close** () throw (cms::CMSException)
Stops the polling thread and closes the streams.
- virtual void **onTransportException** (**Transport** *source, const decaf::lang::Exception &ex)
*Event handler for an exception from a command **transport** (p.67).*

6.468.1 Detailed Description

This type of **transport** (p.67) filter is responsible for correlating asynchronous responses with requests. Non-response messages are simply sent directly to the CommandListener. It owns the **transport** (p.67) that it

6.468.2 Constructor & Destructor Documentation

6.468.2.1 `activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator (const Pointer< Transport > & next)`

Constructor.

Parameters:

next the next **transport** (p. 67) in the chain

6.468.2.2 `virtual activemq::transport::correlator::ResponseCorrelator::~ResponseCorrelator ()` [virtual]

6.468.3 Member Function Documentation

6.468.3.1 `virtual void activemq::transport::correlator::ResponseCorrelator::close () throw (cms::CMSException)` [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

CMSException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 2618).

6.468.3.2 `virtual void activemq::transport::correlator::ResponseCorrelator::onCommand (const Pointer< Command > & command)` [virtual]

This is called in the context of the nested transport's reading thread. In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters:

command the received from the nested **transport** (p. 67).

Reimplemented from **activemq::transport::TransportFilter** (p. 2620).

6.468.3.3 `virtual void activemq::transport::correlator::ResponseCorrelator::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Reimplemented from **activemq::transport::TransportFilter** (p. 2620).

6.468.3.4 virtual void activemq::transport::correlator::ResponseCorrelator::onTransportException (Transport * *source*, const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 67).

Parameters:

source The source of the exception

ex The exception.

6.468.3.5 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

Parameters:

command The request to send.

timeout The time to wait for a response.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 2621).

6.468.3.6 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

Parameters:

command The request to send.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 2622).

**6.468.3.7 virtual void activemq::transport::correlator::ResponseCorrelator::start ()
throw (cms::CMSException) [virtual]**

Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59). If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

CMSException if an error occurs or if this **transport** (p. 67) has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 2622).

Write a object instance to data output stream.

6.469.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2241). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.469.2 Constructor & Destructor Documentation

6.469.2.1 `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::ResponseMarshaller()` [inline]

6.469.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::~~ResponseMarshaller()` [inline, virtual]

6.469.3 Member Function Documentation

6.469.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1113), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1144), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1288), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1446).

6.469.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1113), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1144), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1288), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1446).

6.469.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 529).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1113), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1144), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1288), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1446).

6.469.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 530).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1114), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1145), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1289), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1447).

6.469.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 531).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1114), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1145), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1289), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1447).

6.469.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal2
(OpenWireFormat * wireFormat, commands::DataStructure
*** dataStructure, decaf::io::DataOutputStream * dataOut,**
utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1115), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1146), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1290), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1448).

```
6.469.3.7 virtual void ac-
      tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightUnmarshal
      (OpenWireFormat * wireFormat, commands::DataStructure
      * dataStructure, decaf::io::DataInputStream * dataIn,
      utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1115), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1146), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1290), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1448).

6.470.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2246). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.470.2 Constructor & Destructor Documentation

6.470.2.1 `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::ResponseMarshaller()` [inline]

6.470.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::~~ResponseMarshaller()` [inline, virtual]

6.470.3 Member Function Documentation

6.470.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1105), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1136), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1280), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1454).

6.470.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1105), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1136), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1280), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1454).

6.470.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 515).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1105), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1136), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1280), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1454).

6.470.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 516).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1106), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1137), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1281), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1455).

6.470.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 517).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1106), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1137), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1281), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1455).

6.470.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal2
(OpenWireFormat * wireFormat, commands::DataStructure
*** dataStructure, decaf::io::DataOutputStream * dataOut,**
utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1107), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1138), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1282), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1456).

```
6.470.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightUnmarshal
(OpenWireFormat * wireFormat, commands::DataStructure
 * dataStructure, decaf::io::DataInputStream * dataIn,
 utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 519).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1107), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1138), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1282), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1456).

6.471.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2251). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.471.2 Constructor & Destructor Documentation

6.471.2.1 `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::ResponseMarshaller()` [inline]

6.471.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::~~ResponseMarshaller()` [inline, virtual]

6.471.3 Member Function Documentation

6.471.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1109), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1140), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1284), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1450).

6.471.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1109), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1140), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1284), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1450).

6.471.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 522).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1109), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1140), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1284), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1450).

6.471.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 523).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1110), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1141), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1285), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1451).

6.471.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 524).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1110), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1141), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1285), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1451).

6.471.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1111), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1142), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1286), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1452).

6.471.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1111), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1142), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1286), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1452).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ResponseMarshaller.h**

6.472 decaf::lang::Runnable Class Reference

Interface for a runnable object - defines a task that can be run by a thread.

#include <src/main/decaf/lang/Runnable.h>Inheritance diagram for decaf::lang::Runnable:

Public Member Functions

- virtual `~Runnable()`
- virtual void `run()`=0

*Run method - called by the **Thread** (p. 2544) class in the context of the thread.*

6.472.1 Detailed Description

Interface for a runnable object - defines a task that can be run by a thread.

6.472.2 Constructor & Destructor Documentation

6.472.2.1 virtual decaf::lang::Runnable::~~Runnable() [inline, virtual]

6.472.3 Member Function Documentation

6.472.3.1 virtual void decaf::lang::Runnable::run() [pure virtual]

Run method - called by the **Thread** (p. 2544) class in the context of the thread.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 909), **activemq::threads::DedicatedTaskRunner** (p. 1183), **activemq::transport::IOTransport** (p. 1485), **activemq::transport::mock::InternalCommandListener** (p. 1458), **decaf::lang::Thread** (p. 2545), and **decaf::util::concurrent::PooledThread** (p. 2033).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Runnable.h**

6.473 decaf::lang::Runtime Class Reference

#include <src/main/decaf/lang/Runtime.h> Inheritance diagram for decaf::lang::Runtime:

Public Member Functions

- virtual `~Runtime ()`

Static Public Member Functions

- static `Runtime * getRuntime ()`
*Gets the single instance of the Decaf **Runtime** (p. 2257) for this Process.*
- static void `initializeRuntime (int argc, char **argv)`
Initialize the Decaf Library passing it the args that were passed to the application at startup.
- static void `initializeRuntime ()`
Initialize the Decaf Library.
- static void `shutdownRuntime ()`
Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

6.473.1 Constructor & Destructor Documentation

6.473.1.1 virtual `decaf::lang::Runtime::~~Runtime ()` [inline, virtual]

6.473.2 Member Function Documentation

6.473.2.1 static `Runtime* decaf::lang::Runtime::getRuntime ()` [static]

Gets the single instance of the Decaf **Runtime** (p. 2257) for this Process.

Returns:

pointer to the single Decaf **Runtime** (p. 2257) instance that exists for this process

6.473.2.2 static void `decaf::lang::Runtime::initializeRuntime ()` [static]

Initialize the Decaf Library.

Exceptions:

runtime_error if the library is already initialized or an error occurs during initialization.

6.473.2.3 `static void decaf::lang::Runtime::initializeRuntime (int argc, char **
argv)` [static]

Initialize the Decaf Library passing it the args that were passed to the application at startup.

Parameters:

argc - The number of args passed

argv - Array of char* values passed to the Process on start.

Exceptions:

runtime_error if the library is already initialized or an error occurs during initialization.

6.473.2.4 `static void decaf::lang::Runtime::shutdownRuntime ()` [static]

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Exceptions:

runtime_error if the library has not already been initialized or an error occurs during shutdown.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/`**Runtime.h**

6.474 decaf::lang::exceptions::RuntimeException Class Reference

#include <src/main/decaf/lang/exceptions/RuntimeException.h> Inheritance diagram for decaf::lang::exceptions::RuntimeException:

Public Member Functions

- **RuntimeException** () throw ()
Default Constructor.
- **RuntimeException** (const **Exception** &ex) throw ()
Conversion Constructor from some other ActiveMQException.
- **RuntimeException** (const **RuntimeException** &ex) throw ()
Copy Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **RuntimeException** (const std::exception *cause) throw ()
Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **RuntimeException** * clone () const
Clones this exception.
- virtual ~**RuntimeException** () throw ()

6.474.1 Constructor & Destructor Documentation

6.474.1.1 decaf::lang::exceptions::RuntimeException::RuntimeException () throw () [inline]

Default Constructor.

6.474.1.2 decaf::lang::exceptions::RuntimeException::RuntimeException (const Exception & ex) throw () [inline]

Conversion Constructor from some other ActiveMQException.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.474.1.3 `decaf::lang::exceptions::RuntimeException::RuntimeException (const RuntimeException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.474.1.4 `decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.474.1.5 `decaf::lang::exceptions::RuntimeException::RuntimeException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.474.1.6 `decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.474.1.7 virtual decaf::lang::exceptions::RuntimeException::~~RuntimeException
() throw () [inline, virtual]

6.474.2 Member Function Documentation

6.474.2.1 virtual RuntimeException* decaf::lang::exceptions::RuntimeException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p.1268) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p.1271).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**RuntimeException.h**

6.476 decaf::security_provider::SecurityProviderMap Class Reference

Lookup Map for Connector Factories.

```
#include <src/main/decaf/security_provider/SecurityProviderMap.h>
```

Public Member Functions

- void **registerSecurityProvider** (const std::string &name, **SecurityProvider** *provider)
Registers a new provider with this map.
- void **unregisterSecurityProvider** (const std::string &name)
Unregisters a provider from this map.
- **SecurityProvider** * **lookup** (const std::string &name)
Lookup the named provider in the Map.
- std::size_t **getSecurityProviderNames** (std::vector< std::string > &providers)
Fetch a list of provider names that this Map contains.

Static Public Member Functions

- static **SecurityProviderMap** * **getInstance** ()
Gets a singleton instance of this class.

6.476.1 Detailed Description

Lookup Map for Connector Factories. Use the Connector name to find the associated factory. This class does not take ownership of the stored factories, they must be deallocated somewhere.

6.476.2 Member Function Documentation

6.476.2.1 static **SecurityProviderMap*** decaf::security_provider::SecurityProviderMap::getInstance () [static]

Gets a singleton instance of this class.

Referenced by decaf::security_provider::SecurityProviderRegistrar::SecurityProviderRegistrar(), and decaf::security_provider::SecurityProviderRegistrar::~~SecurityProviderRegistrar().

6.476.2.2 std::size_t decaf::security_provider::SecurityProviderMap::getSecurityProviderNames (std::vector< std::string > & providers)

Fetch a list of provider names that this Map contains.

Parameters:

providers A vector object to receive the list

Returns:

count of providers.

**6.476.2.3 `SecurityProvider* decaf::security_ -
 provider::SecurityProviderMap::lookup (const std::string
 & name)`**

Lookup the named provider in the Map.

Parameters:

name the provider name to lookup

Returns:

the provider associated with the name, or NULL

**6.476.2.4 `void decaf::security_ -
 provider::SecurityProviderMap::registerSecurityProvider
 (const std::string & name, SecurityProvider * provider)`**

Registers a new provider with this map.

Parameters:

name A name to associate the provider with
provider the provider object to store in the map.

**6.476.2.5 `void decaf::security_ -
 provider::SecurityProviderMap::unregisterSecurityProvider (const
 std::string & name)`**

Unregisters a provider from this map.

Parameters:

name the name of the provider to remove

The documentation for this class was generated from the following file:

- `src/main/decaf/security_provider/SecurityProviderMap.h`

6.477 decaf::security_provider::SecurityProviderRegistrar Class Reference

Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour).

```
#include <src/main/decaf/security_provider/SecurityProviderRegistrar.h>
```

Public Member Functions

- **SecurityProviderRegistrar** (const std::string &name, **SecurityProvider** *provider, bool manageLifetime=true)
Creates a registrar and registers the provider with the provider map.
- virtual ~**SecurityProviderRegistrar** ()
Unregisters the provider from the provider map and destroys it if `manageLifetime` is set.
- virtual **SecurityProvider** * **getProvider** ()
get a reference to the factory that this class is holding

6.477.1 Detailed Description

Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour).

6.477.2 Constructor & Destructor Documentation

6.477.2.1 decaf::security_provider::SecurityProviderRegistrar::SecurityProviderRegistrar (const std::string & *name*, **SecurityProvider** * *provider*, bool *manageLifetime* = true) [inline]

Creates a registrar and registers the provider with the provider map.

Parameters:

name name of the provider to register

provider the provider object

manageLifetime boolean indicating if this object manages the lifetime of the factory that is being registered.

References decaf::security_provider::SecurityProviderMap::getInstance().

6.477.2.2 virtual decaf::security_provider::SecurityProviderRegistrar::~SecurityProviderRegistrar () [inline, virtual]

Unregisters the provider from the provider map and destroys it if `manageLifetime` is set.

References decaf::security_provider::SecurityProviderMap::getInstance().

6.477.3 Member Function Documentation

6.477.3.1 `virtual SecurityProvider* decaf::security_provider::SecurityProviderRegistrar::getProvider ()`
[inline, virtual]

get a reference to the factory that this class is holding

Returns:

reference to a factory class

The documentation for this class was generated from the following file:

- `src/main/decaf/security_provider/SecurityProviderRegistrar.h`

6.478 activemq::cmsutil::CmsTemplate::SendExecutor Class Reference

#include <src/main/activemq/cmsutil/CmsTemplate.h> Inheritance diagram for activemq::cmsutil::CmsTemplate::SendExecutor:

Public Member Functions

- **SendExecutor** (**MessageCreator** *messageCreator, **CmsTemplate** *parent)
- virtual **~SendExecutor** ()
- virtual void **doInCms** (**cms::Session** *session, **cms::MessageProducer** *producer) throw (**cms::CMSException**)

Execute an action given a session and producer.

6.478.1 Constructor & Destructor Documentation

6.478.1.1 **activemq::cmsutil::CmsTemplate::SendExecutor::SendExecutor** (**MessageCreator** * *messageCreator*, **CmsTemplate** * *parent*) [inline]

6.478.1.2 **virtual activemq::cmsutil::CmsTemplate::SendExecutor::~~SendExecutor** () [inline, virtual]

6.478.2 Member Function Documentation

6.478.2.1 **virtual void activemq::cmsutil::CmsTemplate::SendExecutor::doInCms** (**cms::Session** * *session*, **cms::MessageProducer** * *producer*) throw (**cms::CMSException**) [inline, virtual]

Execute an action given a session and producer.

Parameters:

session the CMS Session

producer the CMS Producer

Exceptions:

cms::CMSException (p. 850) if thrown by CMS API methods

Implements **activemq::cmsutil::ProducerCallback** (p. 2102).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CmsTemplate.h**

6.479 decaf::net::ServerSocket Class Reference

A server socket class (for testing purposes).

```
#include <src/main/decaf/net/ServerSocket.h>
```

Public Types

- typedef apr_socket_t * **SocketHandle**
- typedef apr_sockaddr_t * **SocketAddress**

Public Member Functions

- **ServerSocket** ()
Constructor.
- virtual ~**ServerSocket** ()
Destructor.
- virtual void **bind** (const char *host, int port) throw (SocketException)
Bind and listen to given IP/dns and port.
- virtual void **bind** (const char *host, int port, int backlog) throw (SocketException)
Bind and listen to given IP/dns and port.
- virtual **Socket** * **accept** () throw (SocketException)
Blocks until a client connects to the bound socket.
- virtual void **close** () throw (lang::Exception)
Closes the server socket.
- virtual bool **isBound** () const

6.479.1 Detailed Description

A server socket class (for testing purposes).

6.479.2 Member Typedef Documentation

6.479.2.1 typedef apr_sockaddr_t* decaf::net::ServerSocket::SocketAddress

6.479.2.2 typedef apr_socket_t* decaf::net::ServerSocket::SocketHandle

6.479.3 Constructor & Destructor Documentation

6.479.3.1 decaf::net::ServerSocket::ServerSocket ()

Constructor. Creates a non-bound server socket.

6.479.3.2 virtual decaf::net::ServerSocket::~~ServerSocket () [virtual]

Destructor. Releases socket handle if `close()` (p. 2269) hasn't been called.

6.479.4 Member Function Documentation**6.479.4.1 virtual Socket* decaf::net::ServerSocket::accept () throw (SocketException) [virtual]**

Blocks until a client connects to the bound socket.

Returns:

new socket. Never returns NULL.

6.479.4.2 virtual void decaf::net::ServerSocket::bind (const char * *host*, int *port*, int *backlog*) throw (SocketException) [virtual]

Bind and listen to given IP/dns and port.

Parameters:

host IP address or host name.

port TCP port between 1..65535

backlog Size of listen backlog.

6.479.4.3 virtual void decaf::net::ServerSocket::bind (const char * *host*, int *port*) throw (SocketException) [virtual]

Bind and listen to given IP/dns and port.

Parameters:

host IP address or host name.

port TCP port between 1..65535

6.479.4.4 virtual void decaf::net::ServerSocket::close () throw (lang::Exception) [virtual]

Closes the server socket.

6.479.4.5 virtual bool decaf::net::ServerSocket::isBound () const [virtual]**Returns:**

true if the server socket is bound.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ServerSocket.h`

6.480 cms::Session Class Reference

A **Session** (p. 2270) object is a single-threaded context for producing and consuming messages.

#include <src/main/cms/Session.h> Inheritance diagram for cms::Session:

Public Types

- enum **AcknowledgeMode** {
AUTO_ACKNOWLEDGE, **DUPS_OK_ACKNOWLEDGE**, **CLIENT_-ACKNOWLEDGE**, **SESSION_TRANSACTIONED**,
INDIVIDUAL_ACKNOWLEDGE }

Public Member Functions

- virtual **~Session** ()
- virtual void **close** ()=0 throw (CMSEException)
Closes this session as well as any active child consumers or producers.
- virtual void **commit** ()=0 throw (CMSEException)
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** ()=0 throw (CMSEException)
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** ()=0 throw (CMSEException)
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination)=0 throw (CMSEException)
*Creates a **MessageConsumer** (p. 1795) for the specified destination.*
- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector)=0 throw (CMSEException)
*Creates a **MessageConsumer** (p. 1795) for the specified destination, using a message selector.*
- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector, bool noLocal)=0 throw (CMSEException)
*Creates a **MessageConsumer** (p. 1795) for the specified destination, using a message selector.*
- virtual **MessageConsumer** * **createDurableConsumer** (const **Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)=0 throw (CMSEException)
*Creates a durable subscriber to the specified topic, using a **Message** (p. 1753) selector.*
- virtual **MessageProducer** * **createProducer** (const **Destination** *destination)=0 throw (CMSEException)

*Creates a **MessageProducer** (p. 1878) to send messages to the specified destination.*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)=0 throw (CMSEException)

*Creates a new **QueueBrowser** (p. 2158) to peek at Messages on the given **Queue** (p. 2157).*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)=0 throw (CMSEException)

*Creates a new **QueueBrowser** (p. 2158) to peek at Messages on the given **Queue** (p. 2157).*

- virtual **Queue** * **createQueue** (const std::string &queueName)=0 throw (CMSEException)

*Creates a queue identity given a **Queue** (p. 2157) name.*

- virtual **Topic** * **createTopic** (const std::string &topicName)=0 throw (CMSEException)

*Creates a topic identity given a **Queue** (p. 2157) name.*

- virtual **TemporaryQueue** * **createTemporaryQueue** ()=0 throw (CMSEException)

*Creates a **TemporaryQueue** (p. 2538) object.*

- virtual **TemporaryTopic** * **createTemporaryTopic** ()=0 throw (CMSEException)

*Creates a **TemporaryTopic** (p. 2540) object.*

- virtual **Message** * **createMessage** ()=0 throw (CMSEException)

*Creates a new **Message** (p. 1753).*

- virtual **BytesMessage** * **createBytesMessage** ()=0 throw (CMSEException)

*Creates a **BytesMessage** (p. 759).*

- virtual **BytesMessage** * **createBytesMessage** (const unsigned char *bytes, std::size_t bytesSize)=0 throw (CMSEException)

*Creates a **BytesMessage** (p. 759) and sets the payload to the passed value.*

- virtual **StreamMessage** * **createStreamMessage** ()=0 throw (CMSEException)

*Creates a new **StreamMessage** (p. 2476).*

- virtual **TextMessage** * **createTextMessage** ()=0 throw (CMSEException)

*Creates a new **TextMessage** (p. 2542).*

- virtual **TextMessage** * **createTextMessage** (const std::string &text)=0 throw (CMSEException)

*Creates a new **TextMessage** (p. 2542) and set the text to the value given.*

- virtual **MapMessage** * **createMapMessage** ()=0 throw (CMSEException)

*Creates a new **MapMessage** (p. 1701).*

- virtual **AcknowledgeMode** **getAcknowledgeMode** () const =0 throw (CMSEException)

Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () const =0 throw (CMSEException)
*Gets if the Session is a Transacted **Session** (p. 2270).*
- virtual void **unsubscribe** (const std::string &name)=0 throw (CMSEException)
Unsubscribes a durable subscription that has been created by a client.

6.480.1 Detailed Description

A **Session** (p.2270) object is a single-threaded context for producing and consuming messages. A session serves several purposes:

- It is a factory for its message producers and consumers.
- It supplies provider-optimized message factories.
- It is a factory for TemporaryTopics and TemporaryQueues.
- It provides a way to create **Queue** (p. 2157) or **Topic** (p. 2571) objects for those clients that need to dynamically manipulate provider-specific destination names.
- It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
- It defines a serial order for the messages it consumes and the messages it produces.
- It retains messages it consumes until they have been acknowledged.
- It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 1795) until a message arrives. The thread may then use one or more of the Session's MessageProducers.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's **close** method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
- The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
- Closing a transacted session must roll back the transaction in progress.
- The close method is the only **Session** (p. 2270) method that can be called concurrently.
- Invoking any other **Session** (p. 2270) method on a closed session must throw an **IllegalStateException** (p. 1399). Closing a closed session must not throw any exceptions.

Transacted Sessions

When a **Session** (p. 2270) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 2270) then operates in a single transaction for all Producers and Consumers of that **Session** (p. 2270). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 1878) this implies that all messages sent by the producer are not sent to the Provider until the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 1795) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all Consumed **Message** (p. 1753) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 1753).

Since:

1.0

6.480.2 Member Enumeration Documentation

6.480.2.1 enum cms::Session::AcknowledgeMode

Enumerator:

AUTO_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns.

DUPS_OK_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

CLIENT_ACKNOWLEDGE With this acknowledgment mode, the client acknowledges a consumed message by calling the message's acknowledge method.

SESSION_TRANSACTED Messages will be consumed when the transaction commits.

INDIVIDUAL_ACKNOWLEDGE **Message** (p. 1753) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

6.480.3 Constructor & Destructor Documentation

6.480.3.1 virtual cms::Session::~~Session () [inline, virtual]

6.480.4 Member Function Documentation

6.480.4.1 virtual void cms::Session::close () throw (CMSEException) [pure virtual]

Closes this session as well as any active child consumers or producers.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implements **cms::Closeable** (p. 838).

Implemented in **activemq::cmsutil::PooledSession** (p. 2021), and **activemq::core::ActiveMQSession** (p. 356).

6.480.4.2 `virtual void cms::Session::commit () throw (CMSEException) [pure virtual]`

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

IllegalStateException (p. 1399) - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2021), and **activemq::core::ActiveMQSession** (p. 357).

Referenced by **activemq::cmsutil::PooledSession::commit()**.

6.480.4.3 `virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * queue, const std::string & selector) throw (CMSEException) [pure virtual]`

Creates a new **QueueBrowser** (p. 2158) to peek at Messages on the given **Queue** (p. 2157).

Parameters:

queue the **Queue** (p. 2157) to browse

selector the **Message** (p. 1753) selector to filter which messages are browsed.

Returns:

New **QueueBrowser** (p. 2158) that is owned by the caller.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

InvalidDestinationException (p. 1466) - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2022), and **activemq::core::ActiveMQSession** (p. 357).

6.480.4.4 `virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * queue) throw (CMSEException) [pure virtual]`

Creates a new **QueueBrowser** (p. 2158) to peek at Messages on the given **Queue** (p. 2157).

Parameters:

queue the **Queue** (p. 2157) to browse

Returns:

New **QueueBrowser** (p. 2158) that is owned by the caller.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

InvalidDestinationException (p. 1466) - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2022), and **activemq::core::ActiveMQSession** (p. 357).

6.480.4.5 `virtual BytesMessage* cms::Session::createBytesMessage (const unsigned char * bytes, std::size_t bytesSize) throw (CMSEException) [pure virtual]`

Creates a **BytesMessage** (p. 759) and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2023), and **activemq::core::ActiveMQSession** (p. 358).

6.480.4.6 `virtual BytesMessage* cms::Session::createBytesMessage () throw (CMSEException) [pure virtual]`

Creates a **BytesMessage** (p. 759).

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2023), and **activemq::core::ActiveMQSession** (p. 358).

Referenced by `activemq::cmsutil::PooledSession::createBytesMessage()`.

6.480.4.7 `virtual MessageConsumer* cms::Session::createConsumer (const Destination * destination, const std::string & selector, bool noLocal) throw (CMSEException) [pure virtual]`

Creates a **MessageConsumer** (p. 1795) for the specified destination, using a message selector.

Parameters:

destination the **Destination** (p. 1190) that this consumer receiving messages for.

selector the **Message** (p. 1753) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new **MessageConsumer** (p. 1795) that is owned by the caller (caller deletes)

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

InvalidDestinationException (p. 1466) - if an invalid destination is specified.

InvalidSelectorException (p. 1473) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2024), and **activemq::core::ActiveMQSession** (p. 358).

6.480.4.8 virtual **MessageConsumer*** **cms::Session::createConsumer** (**const Destination * destination**, **const std::string & selector**) **throw (CMSEException)** [pure virtual]

Creates a **MessageConsumer** (p. 1795) for the specified destination, using a message selector.

Parameters:

destination the **Destination** (p. 1190) that this consumer receiving messages for.

selector the **Message** (p. 1753) Selector to use

Returns:

pointer to a new **MessageConsumer** (p. 1795) that is owned by the caller (caller deletes)

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

InvalidDestinationException (p. 1466) - if an invalid destination is specified.

InvalidSelectorException (p. 1473) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2024), and **activemq::core::ActiveMQSession** (p. 359).

6.480.4.9 virtual **MessageConsumer*** **cms::Session::createConsumer** (**const Destination * destination**) **throw (CMSEException)** [pure virtual]

Creates a **MessageConsumer** (p. 1795) for the specified destination.

Parameters:

destination the **Destination** (p. 1190) that this consumer receiving messages for.

Returns:

pointer to a new **MessageConsumer** (p. 1795) that is owned by the caller (caller deletes)

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

InvalidDestinationException (p. 1466) - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2025), and **activemq::core::ActiveMQSession** (p. 359).

Referenced by **activemq::cmsutil::PooledSession::createConsumer()**.

6.480.4.10 `virtual MessageConsumer* cms::Session::createDurableConsumer (const Topic * destination, const std::string & name, const std::string & selector, bool noLocal = false) throw (CMSEException) [pure virtual]`

Creates a durable subscriber to the specified topic, using a **Message** (p.1753) selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the **Message** (p.1753) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable **MessageConsumer** (p.1795) that is owned by the caller (caller deletes)

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

InvalidDestinationException (p. 1466) - if an invalid destination is specified.

InvalidSelectorException (p. 1473) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2025), and **activemq::core::ActiveMQSession** (p. 359).

Referenced by **activemq::cmsutil::PooledSession::createDurableConsumer()**.

6.480.4.11 `virtual MapMessage* cms::Session::createMapMessage () throw (CMSEException) [pure virtual]`

Creates a new **MapMessage** (p.1701).

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2026), and **activemq::core::ActiveMQSession** (p. 360).

Referenced by **activemq::cmsutil::PooledSession::createMapMessage()**.

6.480.4.12 `virtual Message* cms::Session::createMessage () throw (CMSException) [pure virtual]`

Creates a new **Message** (p.1753).

Exceptions:

CMSException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2026), and **activemq::core::ActiveMQSession** (p. 360).

Referenced by **activemq::cmsutil::PooledSession::createMessage()**.

6.480.4.13 `virtual MessageProducer* cms::Session::createProducer (const Destination * destination) throw (CMSException) [pure virtual]`

Creates a **MessageProducer** (p.1878) to send messages to the specified destination.

Parameters:

destination the **Destination** (p.1190) to send on

Returns:

New **MessageProducer** (p.1878) that is owned by the caller.

Exceptions:

CMSException (p. 850) - If an internal error occurs.

InvalidDestinationException (p. 1466) - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2026), and **activemq::core::ActiveMQSession** (p. 360).

Referenced by **activemq::cmsutil::PooledSession::createProducer()**.

6.480.4.14 `virtual Queue* cms::Session::createQueue (const std::string & queueName) throw (CMSException) [pure virtual]`

Creates a queue identity given a **Queue** (p.2157) name.

Parameters:

queueName the name of the new **Queue** (p.2157)

Returns:

new **Queue** (p.2157) pointer that is owned by the caller.

Exceptions:

CMSException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2027), and **activemq::core::ActiveMQSession** (p. 361).

Referenced by **activemq::cmsutil::PooledSession::createQueue()**.

6.480.4.15 `virtual StreamMessage* cms::Session::createStreamMessage () throw (CMSEException) [pure virtual]`

Creates a new **StreamMessage** (p. 2476).

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2027), and **activemq::core::ActiveMQSession** (p. 361).

Referenced by **activemq::cmsutil::PooledSession::createStreamMessage()**.

6.480.4.16 `virtual TemporaryQueue* cms::Session::createTemporaryQueue () throw (CMSEException) [pure virtual]`

Creates a **TemporaryQueue** (p. 2538) object.

Returns:

new **TemporaryQueue** (p. 2538) pointer that is owned by the caller.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2028), and **activemq::core::ActiveMQSession** (p. 361).

Referenced by **activemq::cmsutil::PooledSession::createTemporaryQueue()**.

6.480.4.17 `virtual TemporaryTopic* cms::Session::createTemporaryTopic () throw (CMSEException) [pure virtual]`

Creates a **TemporaryTopic** (p. 2540) object.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2028), and **activemq::core::ActiveMQSession** (p. 361).

Referenced by **activemq::cmsutil::PooledSession::createTemporaryTopic()**.

6.480.4.18 `virtual TextMessage* cms::Session::createTextMessage (const std::string & text) throw (CMSEException) [pure virtual]`

Creates a new **TextMessage** (p. 2542) and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::PooledSession` (p. 2028), and `activemq::core::ActiveMQSession` (p. 362).

6.480.4.19 `virtual TextMessage* cms::Session::createTextMessage () throw (CMSEException) [pure virtual]`

Creates a new **TextMessage** (p. 2542).

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::PooledSession` (p. 2028), and `activemq::core::ActiveMQSession` (p. 362).

Referenced by `activemq::cmsutil::PooledSession::createTextMessage()`.

6.480.4.20 `virtual Topic* cms::Session::createTopic (const std::string & topicName) throw (CMSEException) [pure virtual]`

Creates a topic identity given a **Queue** (p. 2157) name.

Parameters:

topicName the name of the new **Topic** (p. 2571)

Returns:

new **Topic** (p. 2571) pointer that is owned by the caller.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::PooledSession` (p. 2029), and `activemq::core::ActiveMQSession` (p. 362).

Referenced by `activemq::cmsutil::PooledSession::createTopic()`.

6.480.4.21 `virtual AcknowledgeMode cms::Session::getAcknowledgeMode () const throw (CMSEException) [pure virtual]`

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2029), and **activemq::core::ActiveMQSession** (p. 364).

Referenced by **activemq::cmsutil::PooledSession::getAcknowledgeMode()**.

6.480.4.22 **virtual bool cms::Session::isTransacted () const throw (CMSEException)** [pure virtual]

Gets if the Sessions is a Transacted **Session** (p. 2270).

Returns:

transacted true - false.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2030), and **activemq::core::ActiveMQSession** (p. 365).

Referenced by **activemq::cmsutil::PooledSession::isTransacted()**.

6.480.4.23 **virtual void cms::Session::recover () throw (CMSEException)** [pure virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException (p. 1399) - if the method is called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2030), and **activemq::core::ActiveMQSession** (p. 366).

Referenced by **activemq::cmsutil::PooledSession::recover()**.

6.480.4.24 **virtual void cms::Session::rollback () throw (CMSEException)** [pure virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

IllegalStateException (p. 1399) - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2031), and **activemq::core::ActiveMQSession** (p. 366).

Referenced by **activemq::cmsutil::PooledSession::rollback()**.

6.480.4.25 virtual void cms::Session::unsubscribe (const std::string & name) throw (CMSEException) [pure virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 1795) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2031), and **activemq::core::ActiveMQSession** (p. 367).

Referenced by **activemq::cmsutil::PooledSession::unsubscribe()**.

The documentation for this class was generated from the following file:

- **src/main/cms/Session.h**

6.481 activemq::cmsutil::SessionCallback Class Reference

Callback for executing any number of operations on a provided CMS Session.

#include <src/main/activemq/cmsutil/SessionCallback.h> Inheritance diagram for activemq::cmsutil::SessionCallback:

Public Member Functions

- virtual `~SessionCallback ()`
- virtual void `doInCms (cms::Session *session)=0` throw (cms::CMSEException)
Execute any number of operations against the supplied CMS session.

6.481.1 Detailed Description

Callback for executing any number of operations on a provided CMS Session.

6.481.2 Constructor & Destructor Documentation

- 6.481.2.1 virtual `activemq::cmsutil::SessionCallback::~~SessionCallback ()` [inline, virtual]

6.481.3 Member Function Documentation

- 6.481.3.1 virtual void `activemq::cmsutil::SessionCallback::doInCms (cms::Session * session)` throw (cms::CMSEException) [pure virtual]

Execute any number of operations against the supplied CMS session.

Parameters:

session the CMS Session

Exceptions:

cms::CMSEException (p. 850) if thrown by CMS API methods

Implemented in `activemq::cmsutil::CmsTemplate::ProducerExecutor` (p. 2103), and `activemq::cmsutil::CmsTemplate::ReceiveExecutor` (p. 2172).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/SessionCallback.h`

6.482 activemq::commands::SessionId Class Reference

#include <src/main/activemq/commands/SessionId.h> Inheritance diagram for activemq::commands::SessionId:

Public Types

- typedef decaf::lang::PointerComparator< SessionId > COMPARATOR

Public Member Functions

- SessionId ()
- SessionId (const SessionId &other)
- SessionId (const ConnectionId *connectionId, long long sessionId)
- SessionId (const ProducerId *producerId)
- SessionId (const ConsumerId *consumerId)
- virtual ~SessionId ()
- virtual unsigned char getDataStructureType () const
Get the unique identifier that this object and its own Marshaler share.
- virtual SessionId * cloneDataStructure () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void copyDataStructure (const DataStructure *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string toString () const
Returns a string containing the information for this DataStructure (p. 1174) such as its type and value of its elements.
- virtual bool equals (const DataStructure *value) const
Compares the DataStructure (p. 1174) passed in to this one, and returns if they are equivalent.
- const Pointer< ConnectionId > & getParentId () const
- virtual const std::string & getConnectionId () const
- virtual std::string & getConnectionId ()
- virtual void setConnectionId (const std::string &connectionId)
- virtual long long getValue () const
- virtual void setValue (long long value)
- virtual int compareTo (const SessionId &value) const
- virtual bool equals (const SessionId &value) const
- virtual bool operator== (const SessionId &value) const
- virtual bool operator< (const SessionId &value) const
- SessionId & operator= (const SessionId &other)

Static Public Attributes

- static const unsigned char **ID_SESSIONID** = 121

Protected Attributes

- std::string **connectionId**
- long long **value**

6.482.1 Member Typedef Documentation

- 6.482.1.1** `typedef decaf::lang::PointerComparator<SessionId>
activemq::commands::SessionId::COMPARATOR`

6.482.2 Constructor & Destructor Documentation

- 6.482.2.1** `activemq::commands::SessionId::SessionId ()`
- 6.482.2.2** `activemq::commands::SessionId::SessionId (const SessionId & other)`
- 6.482.2.3** `activemq::commands::SessionId::SessionId (const ConnectionId *
connectionId, long long sessionId)`
- 6.482.2.4** `activemq::commands::SessionId::SessionId (const ProducerId *
producerId)`
- 6.482.2.5** `activemq::commands::SessionId::SessionId (const ConsumerId *
consumerId)`
- 6.482.2.6** `virtual activemq::commands::SessionId::~~SessionId () [virtual]`

6.482.3 Member Function Documentation

- 6.482.3.1** `virtual SessionId* activemq::commands::SessionId::cloneDataStructure ()
const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

- 6.482.3.2** `virtual int activemq::commands::SessionId::compareTo (const SessionId
& value) const [virtual]`
- 6.482.3.3** `virtual void activemq::commands::SessionId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.482.3.4 `virtual bool activemq::commands::SessionId::equals (const SessionId & value) const` [virtual]

6.482.3.5 `virtual bool activemq::commands::SessionId::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.482.3.6 `virtual std::string& activemq::commands::SessionId::getConnectionId ()` [virtual]

6.482.3.7 `virtual const std::string& activemq::commands::SessionId::getConnectionId () const` [virtual]

Referenced by `activemq::commands::ConsumerId::ConsumerId()`, and `activemq::commands::ProducerId::ProducerId()`.

6.482.3.8 `virtual unsigned char activemq::commands::SessionId::getDataSetType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

6.482.3.9 `const Pointer<ConnectionId>& activemq::commands::SessionId::getParentId () const`

6.482.3.10 `virtual long long activemq::commands::SessionId::getValue () const` [virtual]

Referenced by `activemq::commands::ConsumerId::ConsumerId()`, and `activemq::commands::ProducerId::ProducerId()`.

- 6.482.3.11 `virtual bool activemq::commands::SessionId::operator< (const SessionId & value) const` [virtual]
- 6.482.3.12 `SessionId& activemq::commands::SessionId::operator= (const SessionId & other)`
- 6.482.3.13 `virtual bool activemq::commands::SessionId::operator== (const SessionId & value) const` [virtual]
- 6.482.3.14 `virtual void activemq::commands::SessionId::setConnectionId (const std::string & connectionId)` [virtual]
- 6.482.3.15 `virtual void activemq::commands::SessionId::setValue (long long value)` [virtual]
- 6.482.3.16 `virtual std::string activemq::commands::SessionId::toString () const` [virtual]

Returns a string containing the information for this **DataSet** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataSet` (p.560).

6.482.4 Field Documentation

- 6.482.4.1 `std::string activemq::commands::SessionId::connectionId` [protected]
- 6.482.4.2 `const unsigned char activemq::commands::SessionId::ID_SESSIONID = 121` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

- 6.482.4.3 `long long activemq::commands::SessionId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/SessionId.h`

6.483 activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2288).

#include <src/main/activemq/wireformat/openwire/marshal/v1/SessionIdMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller:

Public Member Functions

- **SessionIdMarshaller** ()
- virtual **~SessionIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.483.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2288). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.483.2 Constructor & Destructor Documentation

6.483.2.1 `activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::SessionIdMarshaller()` [inline]

6.483.2.2 `virtual activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::~~SessionIdMarshaller()` [inline, virtual]

6.483.3 Member Function Documentation

6.483.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.483.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.483.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.483.3.4 virtual void **activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.483.3.5 virtual int **activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.483.3.6 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.483.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.484.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2292). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.484.2 Constructor & Destructor Documentation

6.484.2.1 `activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::SessionIdMarshaller()` [inline]

6.484.2.2 `virtual activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::~~SessionIdMarshaller()` [inline, virtual]

6.484.3 Member Function Documentation

6.484.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.484.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.484.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.484.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.484.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.484.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.484.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.485.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2296). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.485.2 Constructor & Destructor Documentation

6.485.2.1 `activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::SessionIdMarshaller()` [inline]

6.485.2.2 `virtual activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::~~SessionIdMarshaller()` [inline, virtual]

6.485.3 Member Function Documentation

6.485.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.485.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.485.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.485.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.485.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.485.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.485.3.7 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**SessionIdMarshaller.h**

6.486 activemq::commands::SessionInfo Class Reference

#include <src/main/activemq/commands/SessionInfo.h> Inheritance diagram for activemq::commands::SessionInfo:

Public Member Functions

- **SessionInfo** ()
- virtual **~SessionInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **SessionInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- unsigned int **getAckMode** () const
- void **setAckMode** (unsigned int mode)
- virtual const **Pointer**< **SessionId** > & **getSessionId** () const
- virtual **Pointer**< **SessionId** > & **getSessionId** ()
- virtual void **setSessionId** (const **Pointer**< **SessionId** > &sessionId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SESSIONINFO** = 4

Protected Member Functions

- **SessionInfo** (const **SessionInfo** &)
- **SessionInfo** & **operator=** (const **SessionInfo** &)

Protected Attributes

6.486.1 Constructor & Destructor Documentation

6.486.1.1 `activemq::commands::SessionInfo::SessionInfo (const SessionInfo &)`
[inline, protected]

6.486.1.2 `activemq::commands::SessionInfo::SessionInfo ()`

6.486.1.3 `virtual activemq::commands::SessionInfo::~~SessionInfo ()` [virtual]

6.486.2 Member Function Documentation

6.486.2.1 `virtual SessionInfo* activemq::commands::SessionInfo::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.486.2.2 `virtual void activemq::commands::SessionInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.486.2.3 `virtual bool activemq::commands::SessionInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.486.2.4 `unsigned int activemq::commands::SessionInfo::getAckMode () const`
[inline]

6.486.2.5 `virtual unsigned char activemq::commands::SessionInfo::getDataStructureType ()`
`const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

6.486.2.6 `virtual Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ()`
[virtual]

6.486.2.7 `virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () const`
[virtual]

6.486.2.8 `SessionInfo& activemq::commands::SessionInfo::operator= (const SessionInfo &)` [inline, protected]

6.486.2.9 `void activemq::commands::SessionInfo::setAckMode (unsigned int mode)`
[inline]

6.486.2.10 `virtual void activemq::commands::SessionInfo::setSessionId (const Pointer< SessionId > & sessionId)` [virtual]

6.486.2.11 `virtual std::string activemq::commands::SessionInfo::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.486.2.12 `virtual Pointer<Command> activemq::commands::SessionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.486.3 Field Documentation

6.486.3.1 `const unsigned char activemq::commands::SessionInfo::ID_SESSIONINFO = 4` [static]

6.486.3.2 `Pointer<SessionId> activemq::commands::SessionInfo::sessionId` [protected]

The documentation for this class was generated from the following file:

6.487.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p.2304). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.487.2 Constructor & Destructor Documentation

6.487.2.1 `activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::SessionInfoMarshaller()` [inline]

6.487.2.2 `virtual activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::~~SessionInfoMarshaller()` [inline, virtual]

6.487.3 Member Function Documentation

6.487.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.487.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.487.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.487.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.487.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.487.3.6 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.487.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.488.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 2308). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.488.2 Constructor & Destructor Documentation

6.488.2.1 `activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::SessionInfoMarshaller()` `[inline]`

6.488.2.2 `virtual activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::~~SessionInfoMarshaller()` `[inline, virtual]`

6.488.3 Member Function Documentation

6.488.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.488.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.488.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.488.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.488.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.488.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.488.3.7 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

6.489.3 Member Function Documentation

6.489.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.489.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.489.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.489.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.489.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.489.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.489.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

6.490 activemq::cmsutil::SessionPool Class Reference

A pool of CMS sessions from the same connection and with the same acknowledge mode.

```
#include <src/main/activemq/cmsutil/SessionPool.h>
```

Public Member Functions

- **SessionPool** (**cms::Connection** *connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** *resourceLifecycleManager)
Constructs a session pool.
- virtual **~SessionPool** ()
Destroys the pooled session objects, but not the underlying session resources.
- virtual **PooledSession** * **takeSession** () throw (cms::CMSException)
Takes a session from the pool, creating one if necessary.
- virtual void **returnSession** (**PooledSession** *session)
Returns a session to the pool.
- **ResourceLifecycleManager** * **getResourceLifecycleManager** ()

6.490.1 Detailed Description

A pool of CMS sessions from the same connection and with the same acknowledge mode. Internal session resources are managed through a provided **ResourceLifecycleManager** (p. 2228), not by this pool. This class is thread-safe.

6.490.2 Constructor & Destructor Documentation

6.490.2.1 **activemq::cmsutil::SessionPool::SessionPool** (**cms::Connection** * connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** * resourceLifecycleManager)

Constructs a session pool.

Parameters:

connection the connection to be used for creating all sessions.

ackMode the acknowledge mode to be used for all sessions

resourceLifecycleManager the object responsible for managing the lifecycle of any allocated **cms::Session** (p. 2270) resources.

6.490.2.2 **virtual activemq::cmsutil::SessionPool::~SessionPool** () [virtual]

Destroys the pooled session objects, but not the underlying session resources. That is the job of the **ResourceLifecycleManager** (p. 2228).

6.490.3 Member Function Documentation

6.490.3.1 ResourceLifecycleManager* activemq::cmsutil::SessionPool::getResourceLifecycleManager()
() [inline]

6.490.3.2 virtual void activemq::cmsutil::SessionPool::returnSession (PooledSession* *session*) [virtual]

Returns a session to the pool.

Parameters:

session the session to be returned.

6.490.3.3 virtual PooledSession* activemq::cmsutil::SessionPool::takeSession ()
throw (cms::CMSEException) [virtual]

Takes a session from the pool, creating one if necessary.

Returns:

the pooled session object

Exceptions:

cms::CMSEException (p. 850) if an error occurred

The documentation for this class was generated from the following file:

6.492 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

#include <src/main/decaf/util/Set.h> Inheritance diagram for decaf::util::Set< E >:

Public Member Functions

- virtual ~Set ()

6.492.1 Detailed Description

template<typename E> class decaf::util::Set< E >

A collection that contains no duplicate elements. More formally, sets contain no pair of elements e1 and e2 such that e1 == e2, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since:

1.0

6.492.2 Constructor & Destructor Documentation

6.492.2.1 **template<typename E> virtual decaf::util::Set< E >::~~Set ()** [inline, virtual]

The documentation for this class was generated from the following file:

6.493 decaf::lang::Short Class Reference

#include <src/main/decaf/lang/Short.h> Inheritance diagram for decaf::lang::Short:

Public Member Functions

- **Short** (short value)
- **Short** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Short** ()
- virtual int **compareTo** (const **Short** &s) const
*Compares this **Short** (p. 2321) instance with another.*
- bool **equals** (const **Short** &s) const
- virtual bool **operator==** (const **Short** &s) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Short** &s) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const short &s) const
*Compares this **Short** (p. 2321) instance with another.*
- bool **equals** (const short &s) const
- virtual bool **operator==** (const short &s) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const short &s) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a String into a **Short** (p. 2321).*
- static short **reverseBytes** (short value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.
- static short **parseShort** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed short in the radix specified by the second argument.
- static short **parseShort** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal short.
- static **Short valueOf** (short value)
*Returns a **Short** (p. 2321) instance representing the specified short value.*
- static **Short valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Short** (p. 2321) object holding the value given by the specified std::string.*
- static **Short valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Short** (p. 2321) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 16
Size of this objects primitive type in bits.
- static const short **MAX_VALUE** = (short)0x7FFF
Max Value for this Object's primitive type.
- static const short **MIN_VALUE** = (short)0x8000
Max Value for this Object's primitive type.

6.493.1 Constructor & Destructor Documentation

6.493.1.1 decaf::lang::Short::Short (short value)

Parameters:

value - short to wrap

6.493.1.2 decaf::lang::Short::Short (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value - string value to convert to short and wrap

Exceptions:

NumberFormatException

6.493.1.3 virtual decaf::lang::Short::~~Short () [inline, virtual]

6.493.2 Member Function Documentation

6.493.2.1 virtual unsigned char decaf::lang::Short::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p.1954).

6.493.2.2 virtual int decaf::lang::Short::compareTo (const short & *s*) const [virtual]

Compares this **Short** (p. 2321) instance with another.

Parameters:

s - the **Short** (p. 2321) instance to be compared

Returns:

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< short >** (p. 899).

6.493.2.3 virtual int decaf::lang::Short::compareTo (const Short & *s*) const [virtual]

Compares this **Short** (p. 2321) instance with another.

Parameters:

s - the **Short** (p. 2321) instance to be compared

Returns:

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.493.2.4 static Short decaf::lang::Short::decode (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Decodes a String into a **Short** (p. 2321). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p.2327) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Short** (p.2321) object containing the decoded value

Exceptions:

NumberFormatException if the string is not formatted correctly.

6.493.2.5 virtual double decaf::lang::Short::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.493.2.6 bool decaf::lang::Short::equals (const short & *s*) const [inline, virtual]

Returns:

true if the two **Short** (p. 2321) Objects have the same value.

Implements **decaf::lang::Comparable< short >** (p.900).

6.493.2.7 bool decaf::lang::Short::equals (const Short & *s*) const [inline]

Returns:

true if the two **Short** (p. 2321) Objects have the same value.

6.493.2.8 virtual float decaf::lang::Short::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.493.2.9 virtual int decaf::lang::Short::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.493.2.10 virtual long long decaf::lang::Short::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.493.2.11 virtual bool decaf::lang::Short::operator< (const short & s) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< short >** (p.900).

6.493.2.12 virtual bool decaf::lang::Short::operator< (const Short & s) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.493.2.13 `virtual bool decaf::lang::Short::operator==(const short & s) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< short >` (p. 901).

6.493.2.14 `virtual bool decaf::lang::Short::operator==(const Short & s) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.493.2.15 `static short decaf::lang::Short::parseShort(const std::string & s) throw`
`(exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal short. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseShort(const std::string, int)` method.

Parameters:

s - String to convert to a short

Returns:

the converted short value

Exceptions:

NumberFormatException if the string is not a short.

6.493.2.16 static short decaf::lang::Short::parseShort (const std::string & *s*, int *radix*) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed short in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 804) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type `NumberFormatException` is thrown if any of the following situations occurs:

- * The first argument is null or is a string of length zero.
- * The radix is either smaller than **Character.MIN_RADIX** (p. 808) or larger than **Character.MAX_RADIX** (p. 807).
- * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1.
- * The value represented by the string is not a value of type short.

Parameters:

s - the String containing the short representation to be parsed
radix - the radix to be used while parsing *s*

Returns:

the short represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If String does not contain a parsable short.

6.493.2.17 static short decaf::lang::Short::reverseBytes (short *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

Parameters:

value - the short whose bytes we are to reverse

Returns:

the reversed short.

6.493.2.18 virtual short decaf::lang::Short::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1956).

6.493.2.19 static std::string decaf::lang::Short::toString (short *value*) [static]**Returns:**

a string representing the primitive value as Base 10

6.493.2.20 `std::string decaf::lang::Short::toString () const`**Returns:**

this **Short** (p. 2321) Object as a String Representation

6.493.2.21 `static Short decaf::lang::Short::valueOf (const std::string & value, int radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Short** (p. 2321) object holding the value extracted from the specified `std::string` when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the `parseShort(std::string, int)` method. The result is a **Short** (p. 2321) object that represents the short value specified by the string.

Parameters:

value - `std::string` to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Short** (p. 2321) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid short.

6.493.2.22 `static Short decaf::lang::Short::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]`

Returns a **Short** (p. 2321) object holding the value given by the specified `std::string`. The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the `parseShort(std::string)` method. The result is a **Short** (p. 2321) object that represents the short value specified by the string.

Parameters:

value - `std::string` to parse as base 10

Returns:

new **Short** (p. 2321) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal short.

6.493.2.23 `static Short decaf::lang::Short::valueOf (short value) [static]`

Returns a **Short** (p. 2321) instance representing the specified short value.

Parameters:

value - the short to wrap

Returns:

the new **Short** (p. 2321) object wrapping value.

6.493.3 Field Documentation

6.493.3.1 `const short decaf::lang::Short::MAX_VALUE = (short)0x7FFF`
[static]

Max Value for this Object's primitive type.

6.493.3.2 `const short decaf::lang::Short::MIN_VALUE = (short)0x8000` [static]

Max Value for this Object's primitive type.

6.493.3.3 `const int decaf::lang::Short::SIZE = 16` [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Short.h`

6.494 decaf::internal::nio::ShortArrayBuffer Class Reference

Creates a new ShortBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **ByteBuffer** (p. 694) as Read-Only.*

6.494.1 Constructor & Destructor Documentation

6.494.1.1 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **ShortArrayBuffer** (p. 2330) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

6.494.1.2 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (short * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **ShortArrayBuffer** (p. 2330) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.494.1.3 `decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset. The capacity and limit of the new **ShortArrayBuffer** (p. 2330) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 729) to wrap

offset - the position that is this buffers start pos.

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.494.1.4 `decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const ShortArrayBuffer & other)`

Create a **ShortArrayBuffer** (p. 2330) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.

Parameters:

other - the **ShortArrayBuffer** (p. 2330) this one is to mirror.

6.494.1.5 `virtual decaf::internal::nio::ShortArrayBuffer::~~ShortArrayBuffer () [virtual]`

6.494.2 Member Function Documentation

6.494.2.1 `virtual short* decaf::internal::nio::ShortArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the short array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2341).

6.494.2.2 `virtual std::size_t decaf::internal::nio::ShortArrayBuffer::arrayOffset
() throw (decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2341).

6.494.2.3 `virtual ShortBuffer* de-
caf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer ()
const [virtual]`

Creates a new, read-only short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 2341).

6.494.2.4 `virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::compact ()
throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p` = `position()` (p. 631) is copied

to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index **limit()** (p. 631) - 1 is copied to index $n = \text{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this ShortBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2342).

6.494.2.5 **virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate ()**
[virtual]

Creates a new short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new short Buffer which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2342).

6.494.2.6 **virtual short decaf::internal::nio::ShortArrayBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)**
[virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the short is to be read

Returns:

the short that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::ShortBuffer** (p. 2344).

6.494.2.7 virtual short decaf::internal::nio::ShortArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the short at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::ShortBuffer** (p. 2344).

6.494.2.8 virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible short array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::ShortBuffer** (p. 2344).

6.494.2.9 virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 630).

6.494.2.10 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (std::size_t *index*, short *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2345).

6.494.2.11 **virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (short *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)** [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2345).

6.494.2.12 **virtual void decaf::internal::nio::ShortArrayBuffer::setReadOnly (bool *value*)** [inline, protected, virtual]

Sets this **ByteBuffer** (p. 694) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.494.2.13 **virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::slice () const** [virtual]

Creates a new **ShortBuffer** whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ShortBuffer** which the caller owns.

Implements `decaf::nio::ShortBuffer` (p. 2347).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/ShortArrayBuffer.h`

6.495 decaf::nio::ShortBuffer Class Reference

This class defines four categories of operations upon short buffers:.

#include <src/main/decaf/nio/ShortBuffer.h> Inheritance diagram for decaf::nio::ShortBuffer:

Public Member Functions

- virtual **~ShortBuffer** ()
- virtual std::string **toString** () const
- virtual short * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the short array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **ShortBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only short buffer that shares this buffer's content.
- virtual **ShortBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **ShortBuffer** * **duplicate** ()=0
Creates a new short buffer that shares this buffer's content.
- virtual short **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual short **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **ShortBuffer** & **get** (std::vector< short > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **ShortBuffer** & **get** (short *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible short array.
- **ShortBuffer** & **put** (**ShortBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the shorts remaining in the given source buffer into this buffer.

- **ShortBuffer** & **put** (const short *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers shorts into this buffer from the given source array.

- **ShortBuffer** & **put** (std::vector< short > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source shorts array into this buffer.

- virtual **ShortBuffer** & **put** (short value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given shorts into this buffer at the current position, and then increments the position.

- virtual **ShortBuffer** & **put** (std::size_t index, short value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given shorts into this buffer at the given index.

- virtual **ShortBuffer** * **slice** () const =0

*Creates a new **ShortBuffer** (p. 2338) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **ShortBuffer** &value) const

Compares this object with the specified object for order.

- virtual bool **equals** (const **ShortBuffer** &value) const

- virtual bool **operator==** (const **ShortBuffer** &value) const

Compares equality between this object and the one passed.

- virtual bool **operator<** (const **ShortBuffer** &value) const

Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **ShortBuffer** * **allocate** (std::size_t capacity)

Allocates a new Double buffer.

- static **ShortBuffer** * **wrap** (short *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

*Wraps the passed buffer with a new **ShortBuffer** (p. 2338).*

- static **ShortBuffer** * **wrap** (std::vector< short > &buffer)

*Wraps the passed STL short Vector in a **ShortBuffer** (p. 2338).*

Protected Member Functions

- **ShortBuffer** (std::size_t capacity)

*Creates a **ShortBuffer** (p. 2338) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.495.1 Detailed Description

This class defines four categories of operations upon short buffers:

- o Absolute and relative get and put methods that read and write single shorts;
- o Relative bulk get methods that transfer contiguous sequences of shorts from this buffer into an array;
- and
- o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer
- o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.495.2 Constructor & Destructor Documentation

6.495.2.1 decaf::nio::ShortBuffer::ShortBuffer (std::size_t capacity) [protected]

Creates a **ShortBuffer** (p. 2338) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 627) in doubles

6.495.2.2 virtual decaf::nio::ShortBuffer::~~ShortBuffer () [inline, virtual]

6.495.3 Member Function Documentation

6.495.3.1 static ShortBuffer* decaf::nio::ShortBuffer::allocate (std::size_t capacity) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in shorts

Returns:

the **ShortBuffer** (p. 2338) that was allocated, caller owns.

6.495.3.2 `virtual short* decaf::nio::ShortBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the short array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 627)

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2332).

6.495.3.3 `virtual std::size_t decaf::nio::ShortBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2333).

6.495.3.4 `virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer () const [pure virtual]`

Creates a new, read-only short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2333).

6.495.3.5 **virtual ShortBuffer& decaf::nio::ShortBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]**

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 631) - 1 is copied to index $n = \text{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ShortBuffer** (p. 2338)

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2333).

6.495.3.6 **virtual int decaf::nio::ShortBuffer::compareTo (const ShortBuffer & value) const [virtual]**

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.495.3.7 **virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate () [pure virtual]**

Creates a new short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new short **Buffer** (p. 627) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2334).

6.495.3.8 virtual bool decaf::nio::ShortBuffer::equals (const ShortBuffer & *value*)
const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.495.3.9 ShortBuffer& decaf::nio::ShortBuffer::get (short * *buffer*, std::size_t
offset, std::size_t *length*) throw (BufferUnderflowException,
lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if *length* > **remaining()** (p.632), then no bytes are transferred and a **BufferUnderflowException** (p.661) is thrown.

Otherwise, this method copies *length* shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by *length*.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p.627)

Exceptions:

BufferUnderflowException (p.661) - If there are fewer than *length* shorts remaining in this buffer

NullPointerException if the passed buffer is null.

6.495.3.10 ShortBuffer& decaf::nio::ShortBuffer::get (std::vector< short > *buffer*)
throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form *src.get(a)* behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call *buffer.resize(N)* before calling this get method.

Returns:

a reference to this **Buffer** (p.627)

Exceptions:

BufferUnderflowException (p.661) - If there are fewer than *length* shorts remaining in this buffer

6.495.3.11 `virtual short decaf::nio::ShortBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 627) where the short is to be read

Returns:

the short that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2334).

6.495.3.12 `virtual short decaf::nio::ShortBuffer::get () throw (BufferUnderflowException) [pure virtual]`

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the short at the current position

Exceptions:

BufferUnderflowException (p. 661) if there no more data to return

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2335).

6.495.3.13 `virtual bool decaf::nio::ShortBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible short array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2335).

6.495.3.14 `virtual bool decaf::nio::ShortBuffer::operator< (const ShortBuffer & value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.495.3.15 `virtual bool decaf::nio::ShortBuffer::operator==(const ShortBuffer & value) const` [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.495.3.16 `virtual ShortBuffer& decaf::nio::ShortBuffer::put (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given shorts into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the shorts to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2335).

6.495.3.17 `virtual ShortBuffer& decaf::nio::ShortBuffer::put (short value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters:

value - the shorts value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2336).

6.495.3.18 **ShortBuffer& decaf::nio::ShortBuffer::put (std::vector< short > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)**

This method transfers the entire content of the given source shorts array into this buffer. This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters:

buffer - The buffer whose contents are copied to this **ShortBuffer** (p. 2338)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.495.3.19 **ShortBuffer& decaf::nio::ShortBuffer::put (const short * buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)**

This method transfers shorts into this buffer from the given source array. If there are more shorts to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 632), then no shorts are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given `offset` in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters:

buffer- The array from which shorts are to be read

offset- The offset within the array of the first short to be read;

length - The number of shorts to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.495.3.20 ShortBuffer& decaf::nio::ShortBuffer::put (ShortBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the shorts remaining in the given source buffer into this buffer. If there are more shorts remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 632), then no shorts are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `n = src.remaining()` shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters:

src - the buffer to take shorts from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer for the remaining shorts in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.495.3.21 virtual ShortBuffer* decaf::nio::ShortBuffer::slice () const [pure virtual]

Creates a new **ShortBuffer** (p. 2338) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ShortBuffer** (p. 2338) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2336).

6.495.3.22 virtual std::string decaf::nio::ShortBuffer::toString () const [virtual]

Returns:

a `std::string` describing this object

6.495.3.23 `static ShortBuffer* decaf::nio::ShortBuffer::wrap (std::vector< short > & buffer)` [static]

Wraps the passed STL short Vector in a **ShortBuffer** (p.2338). The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new **ShortBuffer** (p.2338) that is backed by *buffer*, caller owns.

6.495.3.24 `static ShortBuffer* decaf::nio::ShortBuffer::wrap (short * array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)` [static]

Wraps the passed buffer with a new **ShortBuffer** (p.2338). The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **ShortBuffer** (p.2338) that is backed by *buffer*, caller owns.

The documentation for this class was generated from the following file:

6.496 activemq::commands::ShutdownInfo Class Reference

#include <src/main/activemq/commands/ShutdownInfo.h> Inheritance diagram for activemq::commands::ShutdownInfo:

Public Member Functions

- **ShutdownInfo** ()
- virtual **~ShutdownInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ShutdownInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual bool **isShutdownInfo** () const
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID _SHUTDOWNINFO** = 11

Protected Member Functions

- **ShutdownInfo** (const **ShutdownInfo** &)
- **ShutdownInfo** & operator= (const **ShutdownInfo** &)

6.496.1 Constructor & Destructor Documentation

6.496.1.1 `activemq::commands::ShutdownInfo::ShutdownInfo (const ShutdownInfo &) [inline, protected]`

6.496.1.2 `activemq::commands::ShutdownInfo::ShutdownInfo ()`

6.496.1.3 `virtual activemq::commands::ShutdownInfo::~~ShutdownInfo () [virtual]`

6.496.2 Member Function Documentation

6.496.2.1 `virtual ShutdownInfo* activemq::commands::ShutdownInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.496.2.2 `virtual void activemq::commands::ShutdownInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.496.2.3 `virtual bool activemq::commands::ShutdownInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.496.2.4 `virtual unsigned char activemq::commands::ShutdownInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

6.496.2.5 `virtual bool activemq::commands::ShutdownInfo::isShutdownInfo () const [inline, virtual]`

Returns:

an answer of true to the **isShutdownInfo()** (p. 2351) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 511).

6.496.2.6 `ShutdownInfo& activemq::commands::ShutdownInfo::operator= (const ShutdownInfo &) [inline, protected]`

6.496.2.7 `virtual std::string activemq::commands::ShutdownInfo::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.496.2.8 `virtual Pointer<Command> activemq::commands::ShutdownInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.496.3 Field Documentation

6.496.3.1 `const unsigned char activemq::commands::ShutdownInfo::ID__ - SHUTDOWNINFO = 11 [static]`

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ShutdownInfo.h**

6.497 activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2352).

6.497.2 Constructor & Destructor Documentation

6.497.2.1 `activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::ShutdownInfoMar
() [inline]`

6.497.2.2 `virtual
activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::~~ShutdownInfoMa
() [inline, virtual]`

6.497.3 Member Function Documentation

6.497.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.497.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::getDataStructureTy
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.497.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.497.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.497.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.497.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.497.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

6.498.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2356). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.498.2 Constructor & Destructor Documentation

6.498.2.1 `activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::ShutdownInfoMarshaller()` [inline]

6.498.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller()` [inline, virtual]

6.498.3 Member Function Documentation

6.498.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.498.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.498.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.498.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.498.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.498.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.498.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ShutdownInfoMarshaller.h**

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2360). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.499.2 Constructor & Destructor Documentation

6.499.2.1 `activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::ShutdownInfoMarshaller()` [inline]

6.499.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller()` [inline, virtual]

6.499.3 Member Function Documentation

6.499.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.499.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.499.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.499.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.499.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.499.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.499.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**ShutdownInfoMarshaller.h**

6.500 decaf::security::SignatureException Class Reference

#include <src/main/decaf/security/SignatureException.h> Inheritance diagram for decaf::security::SignatureException:

Public Member Functions

- **SignatureException** () throw ()
Default Constructor.
- **SignatureException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **SignatureException** (const **SignatureException** &ex) throw ()
Copy Constructor.
- **SignatureException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SignatureException** (const std::exception *cause) throw ()
Constructor.
- **SignatureException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SignatureException** * clone () const
Clones this exception.
- virtual ~**SignatureException** () throw ()

6.500.1 Constructor & Destructor Documentation

6.500.1.1 decaf::security::SignatureException::SignatureException () throw () [inline]

Default Constructor.

6.500.1.2 decaf::security::SignatureException::SignatureException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.500.1.3 decaf::security::SignatureException::SignatureException (const SignatureException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.500.1.4 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.500.1.5 decaf::security::SignatureException::SignatureException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.500.1.6 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.500.1.7 `virtual decaf::security::SignatureException::~~SignatureException ()
 throw () [inline, virtual]`

6.500.2 Member Function Documentation

6.500.2.1 `virtual SignatureException* decaf::security::SignatureException::clone ()
 const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from `decaf::security::GeneralSecurityException` (p. 1381).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/SignatureException.h`

6.501 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 1645) in a human readable format.

#include <src/main/decaf/util/logging/SimpleFormatter.h>Inheritance diagram for decaf::util::logging::SimpleFormatter:

Public Member Functions

- **SimpleFormatter** ()
- virtual **~SimpleFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const
Format the given log record and return the formatted string.
- virtual std::string **formatMessage** (const **LogRecord** &record) const
Format the message string from a log record.
- virtual std::string **getHead** (const **Handler** *handler)
Return the header string for a set of formatted records.
- virtual std::string **getTail** (const **Handler** *handler)
Return the tail string for a set of formatted records.

6.501.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 1645) in a human readable format. The summary will typically be 1 or 2 lines.

6.501.2 Constructor & Destructor Documentation

6.501.2.1 decaf::util::logging::SimpleFormatter::SimpleFormatter () [inline]

6.501.2.2 virtual decaf::util::logging::SimpleFormatter::~~SimpleFormatter ()
[inline, virtual]

6.501.3 Member Function Documentation

6.501.3.1 virtual std::string decaf::util::logging::SimpleFormatter::format (const **LogRecord** & *record*) const [inline, virtual]

Format the given log record and return the formatted string.

Parameters:

record The Log Record to Format

Implements **decaf::util::logging::Formatter** (p. 1372).

6.501.3.2 `virtual std::string decaf::util::logging::SimpleFormatter::formatMessage (const LogRecord & record) const` [inline, virtual]

Format the message string from a log record.

Parameters:

record The Log Record to Format

Implements `decaf::util::logging::Formatter` (p. 1373).

References `decaf::util::logging::LogRecord::getMessage()`.

6.501.3.3 `virtual std::string decaf::util::logging::SimpleFormatter::getHead (const Handler * handler)` [inline, virtual]

Return the header string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

empty string

Implements `decaf::util::logging::Formatter` (p. 1373).

6.501.3.4 `virtual std::string decaf::util::logging::SimpleFormatter::getTail (const Handler * handler)` [inline, virtual]

Return the tail string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

empty string

Implements `decaf::util::logging::Formatter` (p. 1373).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/SimpleFormatter.h`

6.502 decaf::util::logging::SimpleLogger Class Reference

```
#include <src/main/decaf/util/logging/SimpleLogger.h>
```

Public Member Functions

- **SimpleLogger** (const std::string &name)
Constructor.
- virtual **~SimpleLogger** ()
Destructor.
- virtual void **mark** (const std::string &message)
Log a Mark Block Level Log.
- virtual void **debug** (const std::string &file, const int line, const std::string &message)
Log a Debug Level Log.
- virtual void **info** (const std::string &file, const int line, const std::string &message)
Log a Informational Level Log.
- virtual void **warn** (const std::string &file, const int line, const std::string &message)
Log a Warning Level Log.
- virtual void **error** (const std::string &file, const int line, const std::string &message)
Log a Error Level Log.
- virtual void **fatal** (const std::string &file, const int line, const std::string &message)
Log a Fatal Level Log.
- virtual void **log** (const std::string &message)
No-frills log.

6.502.1 Constructor & Destructor Documentation

6.502.1.1 decaf::util::logging::SimpleLogger::SimpleLogger (const std::string &name)

Constructor.

6.502.1.2 virtual decaf::util::logging::SimpleLogger::~~SimpleLogger () [virtual]

Destructor.

6.502.2 Member Function Documentation

6.502.2.1 `virtual void decaf::util::logging::SimpleLogger::debug (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Debug Level Log.

6.502.2.2 `virtual void decaf::util::logging::SimpleLogger::error (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Error Level Log.

6.502.2.3 `virtual void decaf::util::logging::SimpleLogger::fatal (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Fatal Level Log.

6.502.2.4 `virtual void decaf::util::logging::SimpleLogger::info (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Informational Level Log.

6.502.2.5 `virtual void decaf::util::logging::SimpleLogger::log (const std::string & message) [virtual]`

No-frills log.

6.502.2.6 `virtual void decaf::util::logging::SimpleLogger::mark (const std::string & message) [virtual]`

Log a Mark Block Level Log.

6.502.2.7 `virtual void decaf::util::logging::SimpleLogger::warn (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Warning Level Log.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/SimpleLogger.h`

6.503 decaf::net::Socket Class Reference

#include <src/main/decaf/net/Socket.h> Inheritance diagram for decaf::net::Socket:

Public Types

- typedef apr_socket_t * **SocketHandle**
Define the SocketHandle type.
- typedef apr_sockaddr_t * **SocketAddress**
Define the SocketAddress type.

Public Member Functions

- virtual ~**Socket** ()
- virtual void **connect** (const char *host, int port)=0 throw (SocketException)
Connects to the specified destination.
- virtual bool **isConnected** () const =0
Indicates whether or not this socket is connected to a destination.
- virtual io::InputStream * **getInputStream** ()=0
Gets the InputStream for this socket.
- virtual io::OutputStream * **getOutputStream** ()=0
Gets the OutputStream for this socket.
- virtual int **getSoLinger** () const =0 throw (SocketException)
Gets the linger time.
- virtual void **setSoLinger** (int linger)=0 throw (SocketException)
Sets the linger time.
- virtual bool **getKeepAlive** () const =0 throw (SocketException)
Gets the keep alive flag.
- virtual void **setKeepAlive** (bool keepAlive)=0 throw (SocketException)
Enables/disables the keep alive flag.
- virtual int **getReceiveBufferSize** () const =0 throw (SocketException)
Gets the receive buffer size.
- virtual void **setReceiveBufferSize** (int size)=0 throw (SocketException)
Sets the receive buffer size.
- virtual bool **getReuseAddress** () const =0 throw (SocketException)

Gets the reuse address flag.

- virtual void **setReuseAddress** (bool reuse)=0 throw (SocketException)
Sets the reuse address flag.
- virtual int **getSendBufferSize** () const =0 throw (SocketException)
Gets the send buffer size.
- virtual void **setSendBufferSize** (int size)=0 throw (SocketException)
Sets the send buffer size.
- virtual int **getSoTimeout** () const =0 throw (SocketException)
Gets the timeout for socket operations.
- virtual void **setSoTimeout** (int timeout)=0 throw (SocketException)
Sets the timeout for socket operations.

Static Public Attributes

- static const int **INVALID_SOCKET_HANDLE** = 0
Defines a constant for an invalid socket handle.

6.503.1 Member Typedef Documentation

6.503.1.1 typedef apr_sockaddr_t* decaf::net::Socket::SocketAddress

Define the SocketAddress type.

6.503.1.2 typedef apr_socket_t* decaf::net::Socket::SocketHandle

Define the SocketHandle type.

6.503.2 Constructor & Destructor Documentation

6.503.2.1 virtual decaf::net::Socket::~~Socket () [inline, virtual]

6.503.3 Member Function Documentation

6.503.3.1 virtual void decaf::net::Socket::connect (const char * *host*, int *port*) throw (SocketException) [pure virtual]

Connects to the specified destination. Closes this socket if connected to another destination.

Parameters:

host The host of the server to connect to.

port The port of the server to connect to.

Exceptions:

IOException Thrown if a failure occurred in the connect.

Implemented in **decaf::net::BufferedSocket** (p. 643), and **decaf::net::TcpSocket** (p. 2526).

6.503.3.2 virtual io::InputStream* decaf::net::Socket::getInputStream () [pure virtual]

Gets the InputStream for this socket.

Returns:

The InputStream for this socket. NULL if not connected.

Implemented in **decaf::net::BufferedSocket** (p. 643), and **decaf::net::TcpSocket** (p. 2527).

6.503.3.3 virtual bool decaf::net::Socket::getKeepAlive () const throw (SocketException) [pure virtual]

Gets the keep alive flag.

Returns:

True if keep alive is enabled.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 643), and **decaf::net::TcpSocket** (p. 2527).

Referenced by **decaf::net::BufferedSocket::getKeepAlive()**.

6.503.3.4 virtual io::OutputStream* decaf::net::Socket::getOutputStream () [pure virtual]

Gets the OutputStream for this socket.

Returns:

the OutputStream for this socket. NULL if not connected.

Implemented in **decaf::net::BufferedSocket** (p. 643), and **decaf::net::TcpSocket** (p. 2527).

6.503.3.5 virtual int decaf::net::Socket::getReceiveBufferSize () const throw (SocketException) [pure virtual]

Gets the receive buffer size.

Returns:

the receive buffer size in bytes.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 644), and **decaf::net::TcpSocket** (p. 2527).

Referenced by **decaf::net::BufferedSocket::getReceiveBufferSize()**.

6.503.3.6 virtual bool decaf::net::Socket::getReuseAddress () const throw (SocketException) [pure virtual]

Gets the reuse address flag.

Returns:

True if the address can be reused.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 644), and **decaf::net::TcpSocket** (p. 2528).

Referenced by **decaf::net::BufferedSocket::getReuseAddress()**.

6.503.3.7 virtual int decaf::net::Socket::getSendBufferSize () const throw (SocketException) [pure virtual]

Gets the send buffer size.

Returns:

the size in bytes of the send buffer.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 644), and **decaf::net::TcpSocket** (p. 2528).

Referenced by **decaf::net::BufferedSocket::getSendBufferSize()**.

6.503.3.8 virtual int decaf::net::Socket::getSoLinger () const throw (SocketException) [pure virtual]

Gets the linger time.

Returns:

The linger time in seconds.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 644), and **decaf::net::TcpSocket** (p. 2528).

Referenced by **decaf::net::BufferedSocket::getSoLinger()**.

6.503.3.9 virtual int decaf::net::Socket::getSoTimeout () const throw (SocketException) [pure virtual]

Gets the timeout for socket operations.

Returns:

The timeout in milliseconds for socket operations.

Exceptions:

SocketException (p. 2379) Thrown if unable to retrieve the information.

Implemented in **decaf::net::BufferedSocket** (p. 645), and **decaf::net::TcpSocket** (p. 2529).

Referenced by decaf::net::BufferedSocket::getSoTimeout().

6.503.3.10 virtual bool decaf::net::Socket::isConnected () const [pure virtual]

Indicates whether or not this socket is connected to a destination.

Returns:

true if connected

Implemented in **decaf::net::BufferedSocket** (p. 645), and **decaf::net::TcpSocket** (p. 2529).

Referenced by decaf::net::BufferedSocket::isConnected().

6.503.3.11 virtual void decaf::net::Socket::setKeepAlive (bool *keepAlive*) throw (SocketException) [pure virtual]

Enables/disables the keep alive flag.

Parameters:

keepAlive If true, enables the flag.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 645), and **decaf::net::TcpSocket** (p. 2529).

Referenced by decaf::net::BufferedSocket::setKeepAlive().

6.503.3.12 virtual void decaf::net::Socket::setReceiveBufferSize (int *size*) throw (SocketException) [pure virtual]

Sets the receive buffer size.

Parameters:

size Number of bytes to set the receive buffer to.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 646), and **decaf::net::TcpSocket** (p. 2530).

Referenced by **decaf::net::BufferedSocket::setReceiveBufferSize()**.

6.503.3.13 **virtual void decaf::net::Socket::setReuseAddress (bool *reuse*) throw (SocketException)** [pure virtual]

Sets the reuse address flag.

Parameters:

reuse If true, sets the flag.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 646), and **decaf::net::TcpSocket** (p. 2530).

Referenced by **decaf::net::BufferedSocket::setReuseAddress()**.

6.503.3.14 **virtual void decaf::net::Socket::setSendBufferSize (int *size*) throw (SocketException)** [pure virtual]

Sets the send buffer size.

Parameters:

size The number of bytes to set the send buffer to.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 646), and **decaf::net::TcpSocket** (p. 2530).

Referenced by **decaf::net::BufferedSocket::setSendBufferSize()**.

6.503.3.15 **virtual void decaf::net::Socket::setSoLinger (int *linger*) throw (SocketException)** [pure virtual]

Sets the linger time.

Parameters:

linger The linger time in seconds. If 0, linger is off.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 646), and **decaf::net::TcpSocket** (p. 2530).

Referenced by **decaf::net::BufferedSocket::setSoLinger()**.

6.503.3.16 `virtual void decaf::net::Socket::setSoTimeout (int timeout) throw (SocketException)` [pure virtual]

Sets the timeout for socket operations.

Parameters:

timeout The timeout in milliseconds for socket operations.

Exceptions:

SocketException (p. 2379) Thrown if unable to set the information.

Implemented in `decaf::net::BufferedSocket` (p. 647), and `decaf::net::TcpSocket` (p. 2531).

Referenced by `decaf::net::BufferedSocket::setSoTimeout()`.

6.503.4 Field Documentation

6.503.4.1 `const int decaf::net::Socket::INVALID_SOCKET_HANDLE = 0`
[static]

Defines a constant for an invalid socket handle.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/Socket.h`

6.504 decaf::net::SocketError Class Reference

Static utility class to simplify handling of error codes for socket operations.

```
#include <src/main/decaf/net/SocketError.h>
```

Static Public Member Functions

- static int **getErrorCode** ()
Gets the last error appropriate for the platform.
- static std::string **getErrorString** ()
Gets the string description for the last error.

6.504.1 Detailed Description

Static utility class to simplify handling of error codes for socket operations.

6.504.2 Member Function Documentation

6.504.2.1 static int decaf::net::SocketError::getErrorCode () [static]

Gets the last error appropriate for the platform.

6.504.2.2 static std::string decaf::net::SocketError::getErrorString () [static]

Gets the string description for the last error.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketError.h**

6.505 decaf::net::SocketException Class Reference

Exception for errors when manipulating sockets.

#include <src/main/decaf/net/SocketException.h> Inheritance diagram for decaf::net::SocketException:

Public Member Functions

- **SocketException** () throw ()
- **SocketException** (const lang::Exception &ex) throw ()
- **SocketException** (const SocketException &ex) throw ()
- **SocketException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketException** (const std::exception *cause) throw ()
Constructor.
- **SocketException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketException** * clone () const
Clones this exception.
- virtual ~**SocketException** () throw ()

6.505.1 Detailed Description

Exception for errors when manipulating sockets.

6.505.2 Constructor & Destructor Documentation

- 6.505.2.1** decaf::net::SocketException::SocketException () throw () [inline]
- 6.505.2.2** decaf::net::SocketException::SocketException (const lang::Exception &ex) throw () [inline]
- 6.505.2.3** decaf::net::SocketException::SocketException (const SocketException &ex) throw () [inline]
- 6.505.2.4** decaf::net::SocketException::SocketException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.505.2.5 `decaf::net::SocketException::SocketException (const std::exception *
cause) throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.505.2.6 `decaf::net::SocketException::SocketException (const char * file, const int
lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.505.2.7 `virtual decaf::net::SocketException::~SocketException () throw ()
[inline, virtual]`

6.505.3 Member Function Documentation

6.505.3.1 `virtual SocketException* decaf::net::SocketException::clone () const
[inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 1479).

Reimplemented in `decaf::net::BindException` (p. 565), `decaf::net::ConnectException` (p. 940), `decaf::net::NoRouteToHostException` (p. 1941), and `decaf::net::PortUnreachableException` (p. 2039).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketException.h`

6.506 decaf::net::SocketFactory Class Reference

Socket (p. 2371) Factory implementation for use in Creating Sockets.

```
#include <src/main/decaf/net/SocketFactory.h>
```

Public Member Functions

- virtual **~SocketFactory** ()

Static Public Member Functions

- static **Socket * createSocket** (const std::string &uri, const **util::Properties** &properties) throw (**SocketException**)

*Creates and returns a **Socket** (p. 2371) derived Object based on the values defined in the Properties Object that is passed in.*

6.506.1 Detailed Description

Socket (p. 2371) Factory implementation for use in Creating Sockets. Property Options:

Name Value

inputBufferSize size in bytes of the buffered input stream buffer. Defaults to 10000.

outputBufferSize size in bytes of the buffered output stream buffer. Defaults to 10000.

soLinger linger time for the socket (in microseconds). Defaults to 0.

soKeepAlive keep alive flag for the socket (true/false). Defaults to false.

soReceiveBufferSize The size of the socket receive buffer (in bytes). Defaults to 2MB.

soSendBufferSize The size of the socket send buffer (in bytes). Defaults to 2MB.

soTimeout The timeout of socket IO operations (in microseconds). Defaults to 10000

See also:

Socket (p. 2371)

6.506.2 Constructor & Destructor Documentation

6.506.2.1 virtual **decaf::net::SocketFactory::~~SocketFactory** () [inline, virtual]

6.506.3 Member Function Documentation

6.506.3.1 static **Socket*** **decaf::net::SocketFactory::createSocket** (const std::string & *uri*, const **util::Properties** & *properties*) throw (**SocketException**) [static]

Creates and returns a **Socket** (p. 2371) derived Object based on the values defined in the Properties Object that is passed in.

Parameters:

- uri* the **URI** (p. 2638) for the **Socket** (p. 2371) Connection.
- properties* A Properties object that contains configuration details.

Exceptions:

SocketException.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketFactory.h**

6.507 decaf::net::SocketInputStream Class Reference

Input stream for performing reads on a socket.

#include <src/main/decaf/net/SocketInputStream.h> Inheritance diagram for decaf::net::SocketInputStream:

Public Member Functions

- **SocketInputStream** (**Socket::SocketHandle** socket)
Constructor.
- virtual **~SocketInputStream** ()
Destructor.
- virtual std::size_t **available** () const throw (io::IOException)
Returns the number of bytes available on the socket to be read right now.
- virtual unsigned char **read** () throw (io::IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (io::IOException, lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual void **close** () throw (lang::Exception)
Close - does nothing.
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Not supported.
- virtual void **mark** (int readLimit DECAF_UNUSED)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (io::IOException)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const
Determines if this input stream supports the mark and reset methods.
- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.

- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.507.1 Detailed Description

Input stream for performing reads on a socket. This class will only work properly for blocking sockets.

6.507.2 Constructor & Destructor Documentation

6.507.2.1 decaf::net::SocketInputStream::SocketInputStream (Socket::SocketHandle *socket*)

Constructor.

Parameters:

socket the socket handle.

6.507.2.2 virtual decaf::net::SocketInputStream::~~SocketInputStream () [virtual]

Destructor.

6.507.3 Member Function Documentation

6.507.3.1 virtual std::size_t decaf::net::SocketInputStream::available () const throw (io::IOException) [virtual]

Returns the number of bytes available on the socket to be read right now.

Returns:

The number of bytes currently available to be read on the socket.

Implements **decaf::io::InputStream** (p. 1407).

6.507.3.2 virtual void decaf::net::SocketInputStream::close () throw (lang::Exception) [virtual]

Close - does nothing. It is the responsibility of the owner of the socket object to close it.

Exceptions:

CMSException

Implements **decaf::io::Closeable** (p. 840).

6.507.3.3 **virtual void decaf::net::SocketInputStream::lock () throw (lang::Exception)** [inline, virtual]

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.507.3.4 **virtual void decaf::net::SocketInputStream::mark (int readLimit DECAF_UNUSED)** [inline, virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1407).

6.507.3.5 **virtual bool decaf::net::SocketInputStream::markSupported () const** [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1407).

6.507.3.6 **virtual void decaf::net::SocketInputStream::notify () throw (lang::Exception)** [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.507.3.7 virtual void decaf::net::SocketInputStream::notifyAll () throw (lang::Exception) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p.2511).

6.507.3.8 virtual int decaf::net::SocketInputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (io::IOException, lang::exceptions::NullPointerException) [virtual]

Reads an array of bytes from the buffer. If the desired amount of data is not currently available, this operation will block until the appropriate amount of data is available.

Parameters:

buffer (out) the target buffer

offset the position in the buffer to start from.

bufferSize the size of the output buffer.

Returns:

the number of bytes read. or -1 if EOF

Exceptions:

IOException if an error occurs.

Implements **decaf::io::InputStream** (p.1408).

6.507.3.9 virtual unsigned char decaf::net::SocketInputStream::read () throw (io::IOException) [virtual]

Reads a single byte from the buffer. If no data is available, blocks until there is.

Returns:

The next byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::InputStream** (p.1408).

6.507.3.10 `virtual void decaf::net::SocketInputStream::reset () throw (io::IOException) [inline, virtual]`

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an IOException might be thrown. * If such an IOException is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an IOException. * If an IOException is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException

Implements `decaf::io::InputStream` (p. 1408).

6.507.3.11 `virtual std::size_t decaf::net::SocketInputStream::skip (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported.

Exceptions:

an UnsupportedOperationException.

Implements `decaf::io::InputStream` (p. 1409).

6.507.3.12 `virtual void decaf::net::SocketInputStream::unlock () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2512).

6.507.3.13 `virtual void decaf::net::SocketInputStream::wait (unsigned long millisecs) throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:*Exception*

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.507.3.14 virtual void decaf::net::SocketInputStream::wait () throw (lang::Exception) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:*Exception*

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketInputStream.h**

6.508 decaf::net::SocketOutputStream Class Reference

Output stream for performing write operations on a socket.

#include <src/main/decaf/net/SocketOutputStream.h> Inheritance diagram for decaf::net::SocketOutputStream:

Public Member Functions

- **SocketOutputStream** (**Socket::SocketHandle** socket)
Constructor.
- virtual **~SocketOutputStream** ()
- virtual void **write** (unsigned char c) throw (io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (io::IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (io::IOException, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** () throw (io::IOException)
Flush - does nothing.
- virtual void **close** () throw (lang::Exception)
Close - does nothing.
- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.508.1 Detailed Description

Output stream for performing write operations on a socket.

6.508.2 Constructor & Destructor Documentation

6.508.2.1 decaf::net::SocketOutputStream::SocketOutputStream (Socket::SocketHandle *socket*)

Constructor.

Parameters:

socket the socket handle.

6.508.2.2 virtual decaf::net::SocketOutputStream::~~SocketOutputStream () [virtual]

6.508.3 Member Function Documentation

6.508.3.1 virtual void decaf::net::SocketOutputStream::close () throw (lang::Exception) [virtual]

Close - does nothing. It is the responsibility of the owner of the socket object to close it.

Exceptions:

CMSException

Implements **decaf::io::Closeable** (p. 840).

6.508.3.2 virtual void decaf::net::SocketOutputStream::flush () throw (io::IOException) [inline, virtual]

Flush - does nothing.

Exceptions:

IOException

Implements **decaf::io::OutputStream** (p. 1992).

6.508.3.3 virtual void decaf::net::SocketOutputStream::lock () throw (lang::Exception) [inline, virtual]

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.508.3.4 virtual void decaf::net::SocketOutputStream::notify () throw (lang::Exception) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements decaf::util::concurrent::Synchronizable (p. 2510).

6.508.3.5 virtual void decaf::net::SocketOutputStream::notifyAll () throw (lang::Exception) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements decaf::util::concurrent::Synchronizable (p. 2511).

6.508.3.6 virtual void decaf::net::SocketOutputStream::unlock () throw (lang::Exception) [inline, virtual]

Unlocks the object.

Exceptions:

Exception

Implements decaf::util::concurrent::Synchronizable (p. 2512).

6.508.3.7 virtual void decaf::net::SocketOutputStream::wait (unsigned long *milliseconds*) throw (lang::Exception) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements decaf::util::concurrent::Synchronizable (p. 2513).

6.508.3.8 virtual void decaf::net::SocketOutputStream::wait () throw (lang::Exception) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

6.508.3.9 virtual void decaf::net::SocketOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (io::IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implements **decaf::io::OutputStream** (p. 1993).

6.508.3.10 virtual void decaf::net::SocketOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (io::IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

6.508.3.11 virtual void decaf::net::SocketOutputStream::write (unsigned char *c*) throw (io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketOutputStream.h`

6.509 decaf::net::SocketTimeoutException Class Reference

#include <src/main/decaf/net/SocketTimeoutException.h> Inheritance diagram for decaf::net::SocketTimeoutException:

Public Member Functions

- **SocketTimeoutException** () throw ()
Default Constructor.
- **SocketTimeoutException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **SocketTimeoutException** (const **SocketTimeoutException** &ex) throw ()
Copy Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketTimeoutException** (const std::exception *cause) throw ()
Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketTimeoutException** * **clone** () const
Clones this exception.
- virtual ~**SocketTimeoutException** () throw ()

6.509.1 Constructor & Destructor Documentation

6.509.1.1 decaf::net::SocketTimeoutException::SocketTimeoutException () throw () [inline]

Default Constructor.

6.509.1.2 decaf::net::SocketTimeoutException::SocketTimeoutException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.509.1.3 `decaf::net::SocketTimeoutException::SocketTimeoutException (const SocketTimeoutException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.509.1.4 `decaf::net::SocketTimeoutException::SocketTimeoutException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.509.1.5 `decaf::net::SocketTimeoutException::SocketTimeoutException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.509.1.6 `decaf::net::SocketTimeoutException::SocketTimeoutException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.509.1.7 virtual decaf::net::SocketTimeoutException::~~SocketTimeoutException
() throw () [inline, virtual]

6.509.2 Member Function Documentation

6.509.2.1 virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::InterruptedIOException** (p. 1464).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketTimeoutException.h**

6.510 activemq::commands::BrokerError::StackTraceElement Struct Reference

6.511 decaf::internal::io::StandardErrorOutputStream Class Reference

Wrapper Around the Standard error Output facility on the current platform.

#include <src/main/decaf/internal/io/StandardErrorOutputStream.h> Inheritance diagram for decaf::internal::io::StandardErrorOutputStream:

Public Member Functions

- **StandardErrorOutputStream** ()
Default Constructor.
- virtual **~StandardErrorOutputStream** ()
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (decaf::io::IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** () throw (decaf::io::IOException)
Invokes flush on the target output stream.
- virtual void **close** () throw (decaf::lang::Exception)
Invokes close on the target output stream.
- virtual void **lock** () throw (decaf::lang::Exception)
Locks the object.
- virtual void **wait** () throw (decaf::lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (decaf::lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.511.1 Detailed Description

Wrapper Around the Standard error Output facility on the current platform. This allows for the use of alternate output methods on platforms or compilers that do not support `std::cerr`.

6.511.2 Constructor & Destructor Documentation

6.511.2.1 `decaf::internal::io::StandardErrorOutputStream::StandardErrorOutputStream()`

Default Constructor.

6.511.2.2 `virtual decaf::internal::io::StandardErrorOutputStream::~~StandardErrorOutputStream()` [virtual]

6.511.3 Member Function Documentation

6.511.3.1 `virtual void decaf::internal::io::StandardErrorOutputStream::close()` `throw (decaf::lang::Exception)` [inline, virtual]

Invokes close on the target output stream. throws CMSException if an error occurs

Implements `decaf::io::Closeable` (p. 840).

6.511.3.2 `virtual void decaf::internal::io::StandardErrorOutputStream::flush()` `throw (decaf::io::IOException)` [virtual]

Invokes flush on the target output stream. throws `decaf::io::IOException` (p. 1477) if an error occurs

Implements `decaf::io::OutputStream` (p. 1992).

6.511.3.3 `virtual void decaf::internal::io::StandardErrorOutputStream::lock()` `throw (decaf::lang::Exception)` [inline, virtual]

Locks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2508).

6.511.3.4 `virtual void decaf::internal::io::StandardErrorOutputStream::notify()` `throw (decaf::lang::Exception)` [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.511.3.5 `virtual void decaf::internal::io::StandardErrorOutputStream::notifyAll ()
throw (decaf::lang::Exception) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.511.3.6 `virtual void decaf::internal::io::StandardErrorOutputStream::wait
(unsigned long millisecs) throw (decaf::lang::Exception) [inline,
virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.511.3.7 `virtual void decaf::internal::io::StandardErrorOutputStream::wait ()
throw (decaf::lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

6.511.3.8 `virtual void decaf::internal::io::StandardErrorOutputStream::write
(const unsigned char * buffer, std::size_t offset, std::size_t len)
throw (decaf::io::IOException, lang::exceptions::NullPointerException)
[virtual]`

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset The position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

decaf::io::IOException (p. 1477) thrown if an error occurs.

NullPointerException if buffer is null.

Implements **decaf::io::OutputStream** (p. 1993).

6.511.3.9 `virtual void decaf::internal::io::StandardErrorOutputStream::write (const std::vector< unsigned char > & buffer) throw (decaf::io::IOException)` [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

6.511.3.10 `virtual void decaf::internal::io::StandardErrorOutputStream::write (unsigned char c) throw (decaf::io::IOException)` [virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/io/StandardErrorOutputStream.h`

6.512 decaf::internal::io::StandardInputStream Class Reference

#include <src/main/decaf/internal/io/StandardInputStream.h> Inheritance diagram for decaf::internal::io::StandardInputStream:

Public Member Functions

- **StandardInputStream** ()
- virtual **~StandardInputStream** ()
- virtual std::size_t **available** () const throw (decaf::io::IOException)
Indicates the number of bytes available.
- virtual unsigned char **read** () throw (decaf::io::IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual void **close** () throw (lang::Exception)
Closes the target input stream.
- virtual std::size_t **skip** (std::size_t num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual void **mark** (int readLimit DECAF_UNUSED)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (decaf::io::IOException)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const
Determines if this input stream supports the mark and reset methods.

Protected Member Functions

- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.

- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.512.1 Constructor & Destructor Documentation

6.512.1.1 decaf::internal::io::StandardInputStream::StandardInputStream ()

6.512.1.2 virtual decaf::internal::io::StandardInputStream::~~StandardInputStream () [virtual]

6.512.2 Member Function Documentation

6.512.2.1 virtual std::size_t decaf::internal::io::StandardInputStream::available () const throw (decaf::io::IOException) [virtual]

Indicates the number of bytes available.

Returns:

The number of bytes until the end of the **internal** (p. 95) buffer.

Implements **decaf::io::InputStream** (p. 1407).

6.512.2.2 virtual void decaf::internal::io::StandardInputStream::close () throw (lang::Exception) [inline, virtual]

Closes the target input stream.

Exceptions:

decaf::io::IOException (p. 1477) thrown if an error occurs.

Implements **decaf::io::Closeable** (p. 840).

6.512.2.3 virtual void decaf::internal::io::StandardInputStream::lock () throw (lang::Exception) [inline, protected, virtual]

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.512.2.4 virtual void decaf::internal::io::StandardInputStream::mark (int readLimit *DECAF_UNUSED*) [inline, virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1407).

6.512.2.5 virtual bool decaf::internal::io::StandardInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1407).

6.512.2.6 virtual void decaf::internal::io::StandardInputStream::notify () throw (lang::Exception) [inline, protected, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.512.2.7 virtual void decaf::internal::io::StandardInputStream::notifyAll () throw (lang::Exception) [inline, protected, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.512.2.8 `virtual int decaf::internal::io::StandardInputStream::read (unsigned char * buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)` [virtual]

Reads an array of bytes from the buffer.

Parameters:

buffer (out) the target buffer.
offset the position in the buffer to start reading from.
bufferSize the size of the output buffer.

Returns:

The number of bytes read.

Exceptions:

decaf::io::IOException (p. 1477) thrown if an error occurs.
decaf::lang::exceptions::NullPointerException (p. 1951) if buffer is null.

Implements **decaf::io::InputStream** (p. 1408).

6.512.2.9 `virtual unsigned char decaf::internal::io::StandardInputStream::read () throw (decaf::io::IOException)` [virtual]

Reads a single byte from the buffer.

Returns:

The next byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1408).

6.512.2.10 `virtual void decaf::internal::io::StandardInputStream::reset () throw (decaf::io::IOException)` [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an IOException might be thrown. * If such an IOException is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an IOException. * If an IOException is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:*IOException*Implements **decaf::io::InputStream** (p. 1408).

6.512.2.11 `virtual std::size_t decaf::internal::io::StandardInputStream::skip (std::size_t num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Skips over and discards *n* bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If *n* is negative, no bytes are skipped.

The skip method of `InputStream` creates a byte array and then repeatedly reads into it until *n* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:*num* - the number of bytes to skip**Returns:**

total bytes skipped

Exceptions:*decaf::io::IOException* (p. 1477) if an error occurs*decaf::lang::exceptions::UnsupportedOperationException* (p. 2635) If skip is not supported.Implements **decaf::io::InputStream** (p. 1409).

6.512.2.12 `virtual void decaf::internal::io::StandardInputStream::unlock () throw (lang::Exception) [inline, protected, virtual]`

Unlocks the object.

Exceptions:*Exception*Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

6.512.2.13 `virtual void decaf::internal::io::StandardInputStream::wait (unsigned long milliseconds) throw (lang::Exception) [inline, protected, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:*milliseconds* the time in milliseconds to wait, or `WAIT_INFINITE`

Exceptions:***Exception***

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.512.2.14 **virtual void decaf::internal::io::StandardInputStream::wait () throw (lang::Exception)** [inline, protected, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:***Exception***

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardInputStream.h**

6.513 decaf::internal::io::StandardOutputStream Class Reference

#include <src/main/decaf/internal/io/StandardOutputStream.h> Inheritance diagram for decaf::internal::io::StandardOutputStream:

Public Member Functions

- **StandardOutputStream** ()
- virtual **~StandardOutputStream** ()
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (decaf::io::IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** () throw (decaf::io::IOException)
Invokes flush on the target output stream.
- virtual void **close** () throw (decaf::lang::Exception)
Invokes close on the target output stream.
- virtual void **lock** () throw (decaf::lang::Exception)
Locks the object.
- virtual void **unlock** () throw (decaf::lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (decaf::lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.513.1 Constructor & Destructor Documentation

6.513.1.1 `decaf::internal::io::StandardOutputStream::StandardOutputStream ()`

6.513.1.2 `virtual`
`decaf::internal::io::StandardOutputStream::~~StandardOutputStream ()`
`[virtual]`

6.513.2 Member Function Documentation

6.513.2.1 `virtual void decaf::internal::io::StandardOutputStream::close () throw (`
`decaf::lang::Exception) [inline, virtual]`

Invokes close on the target output stream. throws CMSException if an error occurs

Implements `decaf::io::Closeable` (p. 840).

6.513.2.2 `virtual void decaf::internal::io::StandardOutputStream::flush () throw (`
`decaf::io::IOException) [virtual]`

Invokes flush on the target output stream. throws `decaf::io::IOException` (p. 1477) if an error occurs

Implements `decaf::io::OutputStream` (p. 1992).

6.513.2.3 `virtual void decaf::internal::io::StandardOutputStream::lock () throw (`
`decaf::lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2508).

6.513.2.4 `virtual void decaf::internal::io::StandardOutputStream::notify () throw (`
`decaf::lang::Exception) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2510).

6.513.2.5 `virtual void decaf::internal::io::StandardOutputStream::notifyAll ()`
`throw (decaf::lang::Exception) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.513.2.6 `virtual void decaf::internal::io::StandardOutputStream::unlock () throw (decaf::lang::Exception)` [inline, virtual]

Unlocks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

6.513.2.7 `virtual void decaf::internal::io::StandardOutputStream::wait (unsigned long milliseconds) throw (decaf::lang::Exception)` [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.513.2.8 `virtual void decaf::internal::io::StandardOutputStream::wait () throw (decaf::lang::Exception)` [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

6.513.2.9 `virtual void decaf::internal::io::StandardOutputStream::write (const unsigned char * buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException)` [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset, the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

decaf::io::IOException (p. 1477) thrown if an error occurs.

NullPointerException if buffer is null.

Implements **decaf::io::OutputStream** (p. 1993).

6.513.2.10 `virtual void decaf::internal::io::StandardOutputStream::write (const std::vector< unsigned char > & buffer) throw (decaf::io::IOException)` [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

6.513.2.11 `virtual void decaf::internal::io::StandardOutputStream::write (unsigned char c) throw (decaf::io::IOException)` [virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/io/StandardOutputStream.h`

6.514 cms::Startable Class Reference

Interface for a class that implements the start method.

#include <src/main/cms/Startable.h> Inheritance diagram for cms::Startable:

Public Member Functions

- virtual `~Startable()`
- virtual void `start()` throw (CMSEException)
Starts the service.

6.514.1 Detailed Description

Interface for a class that implements the start method. An object that implements the **Startable** (p.2413) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since:

1.0

6.514.2 Constructor & Destructor Documentation

6.514.2.1 virtual cms::Startable::~~Startable() [inline, virtual]

6.514.3 Member Function Documentation

6.514.3.1 virtual void cms::Startable::start() throw (CMSEException) [pure virtual]

Starts the service.

Exceptions:

CMSEException (p. 850) if an internal error occurs while starting.

Implemented in `activemq::core::ActiveMQConnection` (p. 198), `activemq::transport::correlator::ResponseCorrelator` (p. 2240), `activemq::transport::failover::FailoverTransport` (p. 1307), `activemq::transport::IOTransport` (p. 1485), `activemq::transport::mock::MockTransport` (p. 1917), `activemq::transport::TransportFilter` (p. 2622), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 1987).

6.517 decaf::util::StlList< E > Class Template Reference

List (p.1591) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

#include <src/main/decaf/util/StlList.h>Inheritance diagram for decaf::util::StlList< E >:

Data Structures

- class **ConstStlListIterator**
- class **StlListIterator**

Public Member Functions

- **StlList** ()
Default constructor - does nothing.
- **StlList** (const **StlList** &source)
Copy constructor - copies the content of the given set into this one.
- **StlList** (const **Collection**< E > &source)
Copy constructor - copies the content of the given set into this one.
- virtual ~**StlList** ()
- virtual bool **equals** (const **StlList** &source) const
Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.
Returns:
true if the Collections contain the same elements.
- virtual **Iterator**< E > * **iterator** ()
Returns:
an iterator over a set of elements of type T.
- virtual **Iterator**< E > * **iterator** () const
- virtual **ListIterator**< E > * **listIterator** ()
Returns:
a list iterator over the elements in this list (in proper sequence).
- virtual **ListIterator**< E > * **listIterator** () const
- virtual **ListIterator**< E > * **listIterator** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Parameters:
index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range ($\text{index} < 0 \parallel \text{index} > \text{size}()$ (p. 878))

- virtual **ListIterator**< E > * **listIterator** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual void **copy** (const **StlList** &source)

- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1490) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

- virtual bool **contains** (const E &value) const throw (lang::Exception)

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value - the value whose presence is to be queried for in this **Collection** (p. 871).

Returns:

true if the value is contained in this collection

Exceptions:

Exception if an error occurs,

- virtual std::size_t **indexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that $\text{get}(i) == \text{value}$, or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NoSuchElementException if value is not in the list

- virtual std::size_t **lastIndexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that $get(i) == value$ or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NoSuchElementException if value is not in the list

- virtual bool **isEmpty** () const

Returns true if this collection contains no elements.

*This implementation returns **size()** (p. 878) == 0.*

Returns:

true if the size method return 0.

- virtual std::size_t **size** () const

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns:

the number of elements in this collection

- virtual E **get** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Gets the element contained at position passed.

Parameters:

index - position to get

Returns:

value at index

- virtual E **set** (std::size_t index, const E &element) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Replaces the element at the specified position in this list with the specified element.

Parameters:

index - index of the element to replace

element - element to be stored at the specified position

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 871) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value - reference to the element to add.

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

- virtual void **add** (std::size_t index, const E &element) throw (decaf::lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException)

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

- virtual bool **addAll** (std::size_t index, const **Collection**< E > &source) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 871) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

Removes a single instance of the specified element from this collection, if it is present (optional operation).

*More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 871).

- virtual E **remove** (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

6.517.1 Detailed Description

```
template<typename E> class decaf::util::StlList< E >
```

List (p. 1591) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

6.517.2 Constructor & Destructor Documentation

6.517.2.1 `template<typename E> decaf::util::StlList< E >::StlList () [inline]`

Default constructor - does nothing.

6.517.2.2 `template<typename E> decaf::util::StlList< E >::StlList (const StlList< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.517.2.3 `template<typename E> decaf::util::StlList< E >::StlList (const Collection< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.517.2.4 `template<typename E> virtual decaf::util::StlList< E >::~StlList () [inline, virtual]`

6.517.3 Member Function Documentation

6.517.3.1 `template<typename E> virtual void decaf::util::StlList< E >::add (std::size_t index, const E & element) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements `decaf::util::List< E >` (p. 1592).

6.517.3.2 `template<typename E> virtual bool decaf::util::StlList< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 871) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value - reference to the element to add.

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p. 873).

Referenced by **decaf::util::StlList< Pointer< BackupTransport > >::addAll()**.

```
6.517.3.3  template<typename E> virtual bool decaf::util::StlList< E
>::addAll (std::size_t index, const Collection< E > & source)
throw ( decaf::lang::exceptions::UnsupportedOperationException,
decaf::lang::exceptions::IndexOutOfBoundsException ) [inline,
virtual]
```

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 871) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 1592).

6.517.3.4 `template<typename E> virtual void decaf::util::StlList< E >::clear ()
throw (lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1490) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 127).

6.517.3.5 `template<typename E> virtual bool decaf::util::StlList< E >::contains
(const E & value) const throw (lang::Exception) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value - the value whose presence is to be queried for in this **Collection** (p. 871).

Returns:

true if the value is contained in this collection

Exceptions:

Exception if an error occurs,

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 127).

6.517.3.6 `template<typename E> virtual void decaf::util::StlList< E >::copy (const
StlList< E > & source) [inline, virtual]`

Referenced by `decaf::util::StlList< Pointer< BackupTransport > >::StlList()`.

6.517.3.7 `template<typename E> virtual bool decaf::util::StlList< E >::equals
(const StlList< E > & source) const [inline, virtual]`

Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.

Returns:

true if the Collections contain the same elements.

Implements **decaf::util::Collection< E >** (p. 875).

6.517.3.8 `template<typename E> virtual E decaf::util::StlList< E >::get (std::size_t
index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException
) [inline, virtual]`

Gets the element contained at position passed.

Parameters:

index - position to get

Returns:

value at index

Implements **decaf::util::List< E >** (p. 1593).

6.517.3.9 `template<typename E> virtual std::size_t decaf::util::StlList<
E >::indexOf (const E & value) throw (de-
caf::lang::exceptions::NoSuchElementException) [inline,
virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NoSuchElementException if value is not in the list

Implements **decaf::util::List< E >** (p. 1593).

6.517.3.10 `template<typename E> virtual bool decaf::util::StlList< E >::isEmpty
() const [inline, virtual]`

Returns true if this collection contains no elements.

This implementation returns `size() (p. 878) == 0`.

Returns:

true if the size method return 0.

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 129).

6.517.3.11 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E
>::iterator () const [inline, virtual]`

Implements `decaf::lang::Iterable< E >` (p. 1487).

6.517.3.12 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E
>::iterator () [inline, virtual]`

Returns:

an iterator over a set of elements of type T.

Implements `decaf::lang::Iterable< E >` (p. 1487).

6.517.3.13 `template<typename E> virtual std::size_t decaf::util::StlList<
E >::lastIndexOf (const E & value) throw (
decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that `get(i) == value` or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NoSuchElementException if value is not in the list

Implements `decaf::util::List< E >` (p. 1594).

6.517.3.14 `template<typename E> virtual ListIterator<E>* decaf::util::StlList<
E >::listIterator (std::size_t index) const throw (
decaf::lang::exceptions::IndexOutOfBoundsException) [inline,
virtual]`

Implements `decaf::util::List< E >` (p. 1594).

6.517.3.15 `template<typename E> virtual ListIterator<E>*`
`decaf::util::StlList< E >::listIterator (std::size_t index) throw (`
`decaf::lang::exceptions::IndexOutOfBoundsException) [inline,`
`virtual]`

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (`index < 0 || index > size()` (p. 878))

Implements `decaf::util::List< E >` (p. 1595).

6.517.3.16 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E`
`>::listIterator () const [inline, virtual]`

Implements `decaf::util::List< E >` (p. 1595).

6.517.3.17 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E`
`>::listIterator () [inline, virtual]`

Returns:

a list iterator over the elements in this list (in proper sequence).

Implements `decaf::util::List< E >` (p. 1595).

6.517.3.18 `template<typename E> virtual E decaf::util::StlList<`
`E >::remove (std::size_t index) throw (de-`
`cafe::lang::exceptions::UnsupportedOperationException,`
`decaf::lang::exceptions::IndexOutOfBoundsException) [inline,`
`virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 1596).

```
6.517.3.19  template<typename E> virtual bool decaf::util::StlList<
               E >::remove (const E & value) throw (
               lang::exceptions::UnsupportedOperationException,
               lang::exceptions::IllegalArgumentException ) [inline, virtual]
```

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an *UnsupportedOperationException* if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 871).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 130).

```
6.517.3.20  template<typename E> virtual E decaf::util::StlList< E
               >::set (std::size_t index, const E & element) throw (
               decaf::lang::exceptions::IndexOutOfBoundsException ) [inline,
               virtual]
```

Replaces the element at the specified position in this list with the specified element.

Parameters:

index - index of the element to replace

element - element to be stored at the specified position

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

Implements **decaf::util::List**< E > (p. 1596).

6.517.3.21 `template<typename E> virtual std::size_t decaf::util::StlList< E >::size
() const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection**< E > (p. 878).

Referenced by `decaf::util::StlList< Pointer< BackupTransport > >::add()`, `decaf::util::StlList< Pointer< BackupTransport > >::addAll()`, `decaf::util::StlList< Pointer< BackupTransport > >::get()`, `decaf::util::StlList< Pointer< BackupTransport > >::lastIndexOf()`, `decaf::util::StlList< Pointer< BackupTransport > >::listIterator()`, `decaf::util::StlList< Pointer< BackupTransport > >::remove()`, and `decaf::util::StlList< Pointer< BackupTransport > >::set()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlList.h`

6.518 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference

Map (p.1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

#include <src/main/decaf/util/StlMap.h> Inheritance diagram for decaf::util::StlMap< K, V, COMPARATOR >:

Public Member Functions

- **StlMap** ()
Default constructor - does nothing.
- **StlMap** (const **StlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **StlMap** (const **Map**< K, V, COMPARATOR > &source)
Copy constructor - copies the content of the given map into this one.
- virtual ~**StlMap** ()
- virtual bool **equals** (const **StlMap** &source) const
Comparison, equality is dependent on the method of determining if the element are equal.
Parameters:
source - **Map** (p.1689) to compare to this one.
Returns:
*true if the **Map** (p.1689) passed is equal in value to this one.*
- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const
- virtual void **copy** (const **StlMap** &source)
Copies the content of the source map into this map.
Erases all existing data in this map.
Parameters:
source The source object to copy from.
- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)
- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
Exceptions:
UnsupportedOperationException if this map is unmodifiable.
- virtual bool **containsKey** (const K &key) const
Indicates whether or this map contains a value for the given key.

Parameters:

key The key to look up.

Returns:

true if this map contains the value, otherwise false.

- virtual bool **containsValue** (const V &value) const

Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters:

value The Value to look up.

Returns:

true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () const

Returns:

*if the **Map** (p. 1689) contains any element or not, TRUE or FALSE*

- virtual std::size_t **size** () const

Returns:

The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key) throw (lang::exceptions::NoSuchElementException)

*Gets the value mapped to the specified key in the **Map** (p. 1689). If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*

Parameters:

key The search key.

Returns:

A reference to the value for the given key.

Exceptions:

***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 1689).*

- virtual const V & **get** (const K &key) const throw (lang::exceptions::NoSuchElementException)

*Gets the value mapped to the specified key in the **Map** (p. 1689). If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*

Parameters:

key The search key.

Returns:

A {const} reference to the value for the given key.

Exceptions:

***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 1689).*

- virtual void **put** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

Sets the value for the specified key.

Parameters:

key The target key.
value The value to be set.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

- virtual void **putAll** (const **StlMap**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

*Stores a copy of the Mappings contained in the other **Map** (p. 1689) in this one.*

Parameters:

other A **Map** (p. 1689) instance whose elements are to all be inserted in this **Map** (p. 1689).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

- virtual V **remove** (const K &key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters:

key The search key.

Returns:

a copy of the element that was previously mapped to the given key

Exceptions:

NoSuchElementException if this key is not in the **Map** (p. 1689).
UnsupportedOperationException if this map is unmodifiable.

- virtual std::vector< K > **keySet** () const

*Returns a **Set** (p. 2320) view of the mappings contained in this map.*

*The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1490), **Set.remove** (p. 130), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.*

Returns:

the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () const

Returns:

the entire set of values in this map as a std::vector.

- virtual void **lock** () throw (lang::Exception)

Locks the object.

- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.518.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>
class decaf::util::StlMap< K, V, COMPARATOR >
```

Map (p.1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

Since:

1.0

6.518.2 Constructor & Destructor Documentation

6.518.2.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap () [inline]`

Default constructor - does nothing.

6.518.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const StlMap< K, V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.518.2.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const Map< K, V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.518.2.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::StlMap< K, V, COMPARATOR >::~~StlMap () [inline, virtual]`

6.518.3 Member Function Documentation

6.518.3.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::clear () throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes all keys and values from this map.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1690).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::copy()`.

6.518.3.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsKey (const K & key) const [inline, virtual]`

Indicates whether or this map contains a value for the given key.

Parameters:

key The key to look up.

Returns:

true if this map contains the value, otherwise false.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1691).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::equals()`.

6.518.3.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsValue (const V & value) const [inline, virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters:

value The Value to look up.

Returns:

true if this map contains the value, otherwise false.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1692).

6.518.3.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & source) [inline, virtual]`

6.518.3.5 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const StlMap< K, V, COMPARATOR > & source) [inline, virtual]`

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters:

source The source object to copy from.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1693).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::StlMap()`.

6.518.3.6 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & source) const [inline, virtual]`

6.518.3.7 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const StlMap< K, V, COMPARATOR > & source) const [inline, virtual]`

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters:

source - `Map` (p. 1689) to compare to this one.

Returns:

true if the `Map` (p. 1689) passed is equal in value to this one.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1693).

6.518.3.8 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & key) const throw (lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the `Map` (p. 1689).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters:

key The search key.

Returns:

A {const} reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1689).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1693).

```
6.518.3.9  template<typename K, typename V, typename COMPARATOR
           = std::less<K>> virtual V& decaf::util::StlMap< K,
           V, COMPARATOR >::get (const K & key) throw (
           lang::exceptions::NoSuchElementException ) [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 1689).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters:

key The search key.

Returns:

A reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1689).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1694).

```
6.518.3.10 template<typename K, typename V, typename COMPARATOR =
           std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
           >::isEmpty () const [inline, virtual]
```

Returns:

if the **Map** (p. 1689) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1695).

```
6.518.3.11 template<typename K, typename V, typename COMPARATOR =
           std::less<K>> virtual std::vector<K> decaf::util::StlMap< K, V,
           COMPARATOR >::keySet () const [inline, virtual]
```

Returns a **Set** (p. 2320) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1490), **Set.remove** (p. 130), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

Returns:

the entire set of keys in this map as a `std::vector`.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1696).

6.518.3.12 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::lock () throw (lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.518.3.13 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::notify () throw (lang::Exception) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.518.3.14 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::notifyAll () throw (lang::Exception) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.518.3.15 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::put (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Sets the value for the specified key.

Parameters:

key The target key.

value The value to be set.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1697).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::putAll()`.

6.518.3.16 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

6.518.3.17 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const StlMap< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 1689) in this one.

Parameters:

other A **Map** (p. 1689) instance whose elements are to all be inserted in this **Map** (p. 1689).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1697).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::copy()`.

6.518.3.18 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::StlMap< K, V, COMPARATOR >::remove (const K & key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters:

key The search key.

Returns:

a copy of the element that was previously mapped to the given key

Exceptions:

NoSuchElementException if this key is not in the **Map** (p. 1689).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1698).

6.518.3.19 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::size_t decaf::util::StlMap< K, V, COMPARATOR >::size () const [inline, virtual]`

Returns:

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1699).

6.518.3.20 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::unlock () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

6.518.3.21 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<V> decaf::util::StlMap< K, V, COMPARATOR >::values () const [inline, virtual]`

Returns:

the entire set of values in this map as a `std::vector`.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1700).

Referenced by **decaf::util::StlMap< std::string, cms::Topic * >::values()**.

6.518.3.22 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::wait (unsigned long milliseconds) throw (lang::Exception) [inline,
virtual]`

Waits on a signal from this object, which is generated by a call to **Notify**. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or **WAIT_INFINITE**

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.518.3.23 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::wait () throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to **Notify**. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

The documentation for this class was generated from the following file:

- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.
- T & **getSafeValue** ()
Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

6.519.1 Detailed Description

`template<typename T> class decaf::util::StlQueue< T >`

The **Queue** (p. 2154) class accepts messages with an `psuh(m)` command where `m` is the message to be queued. It destructively returns the message with **pop()** (p. 2444). **pop()** (p. 2444) returns messages in the order they were enqueued.

Queue (p. 2154) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the `pop` method actually reurns a reference to the element popped. This frees the app from having to call the **front** method before calling `pop`.

```
Queue<string> sq; // make a queue to hold string messages sq.push(s); // enqueues a message
m string s = sq.pop(); // dequeues a message
```

= DESIGN CONSIDERATIONS

The **Queue** (p. 2154) class inherits from the Synchronizable interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 2154).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

6.519.2 Constructor & Destructor Documentation

6.519.2.1 `template<typename T> decaf::util::StlQueue< T >::StlQueue ()`
[inline]

6.519.2.2 `template<typename T> virtual decaf::util::StlQueue< T >::~StlQueue ()`
[inline, virtual]

6.519.3 Member Function Documentation

6.519.3.1 `template<typename T> const T& decaf::util::StlQueue< T >::back ()`
const [inline]

Returns a Reference to the element at the tail of the queue.

Returns:

reference to a queue type object or (safe)

6.519.3.2 `template<typename T> T& decaf::util::StlQueue< T >::back ()` [inline]

Returns a Reference to the element at the tail of the queue.

Returns:

reference to a queue type object or (safe)

6.519.3.3 `template<typename T> void decaf::util::StlQueue< T >::clear ()`
[inline]

Empties this queue.

6.519.3.4 `template<typename T> bool decaf::util::StlQueue< T >::empty () const`
[inline]

Checks if this **Queue** (p. 2154) is currently empty.

Returns:

boolean indicating queue emptiness

6.519.3.5 `template<typename T> void decaf::util::StlQueue< T >::enqueueFront`
`(const T & t)` [inline]

Places a new Object at the front of the queue.

Parameters:

t - **Queue** (p. 2154) Object Type reference.

6.519.3.6 `template<typename T> const T& decaf::util::StlQueue< T >::front ()`
`const [inline]`

Returns a Reference to the element at the head of the queue.

Returns:

reference to a queue type object or (safe)

6.519.3.7 `template<typename T> T& decaf::util::StlQueue< T >::front ()`
`[inline]`

Returns a Reference to the element at the head of the queue.

Returns:

reference to a queue type object or (safe)

6.519.3.8 `template<typename T> T& decaf::util::StlQueue< T >::getSafeValue ()`
`[inline]`

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

Returns:

Reference to this Queues safe object

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::back()`, `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::front()`, and `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::pop()`.

6.519.3.9 `template<typename T> Iterator<T>* decaf::util::StlQueue< T`
`>::iterator () [inline]`

Gets an **Iterator** (p.1489) over this **Queue** (p.2154).

Returns:

new iterator pointer that is owned by the caller.

6.519.3.10 `template<typename T> virtual void decaf::util::StlQueue< T >::lock ()`
`throw (lang::Exception) [inline, virtual]`

Locks the object.

Implements `decaf::util::concurrent::Synchronizable` (p.2508).

6.519.3.11 `template<typename T> virtual void decaf::util::StlQueue< T >::notify`
`() throw (lang::Exception) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.519.3.12 `template<typename T> virtual void decaf::util::StlQueue< T >::notifyAll () throw (lang::Exception) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.519.3.13 `template<typename T> T decaf::util::StlQueue< T >::pop () [inline]`

Removes and returns the element that is at the Head of the queue.

Returns:

reference to a queue type object or (safe)

6.519.3.14 `template<typename T> void decaf::util::StlQueue< T >::push (const T & t) [inline]`

Places a new Object at the Tail of the queue.

Parameters:

t - **Queue** (p. 2154) Object Type reference.

6.519.3.15 `template<typename T> void decaf::util::StlQueue< T >::reverse (StlQueue< T > & target) const [inline]`

Reverses the order of the contents of this queue and stores them in the target queue.

Parameters:

target - The target queue that will receive the contents of this queue in reverse order.

6.519.3.16 `template<typename T> size_t decaf::util::StlQueue< T >::size () const [inline]`

Gets the Number of elements currently in the **Queue** (p. 2154).

Returns:

Queue (p. 2154) Size

6.519.3.17 `template<typename T> virtual std::vector<T> decaf::util::StlQueue< T >::toArray () const [inline, virtual]`

Returns:

the all values in this queue as a std::vector.

6.519.3.18 `template<typename T> virtual void decaf::util::StlQueue< T >::unlock
 () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

6.519.3.19 `template<typename T> virtual void decaf::util::StlQueue< T >::wait
 (unsigned long millisecs) throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs time to wait, or WAIT_INFINITE

Exceptions:

ActiveMQException

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.519.3.20 `template<typename T> virtual void decaf::util::StlQueue< T >::wait ()
 throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlQueue.h`

6.520 decaf::util::StlSet< E > Class Template Reference

Set (p. 2320) template that wraps around a `std::set` to provide a more user-friendly interface and to provide common functions that do not exist in `std::set`.

`#include <src/main/decaf/util/StlSet.h>` Inheritance diagram for `decaf::util::StlSet< E >`:

Data Structures

- class **ConstSetIterator**
- class **SetIterator**

Public Member Functions

- **StlSet** ()
Default constructor - does nothing.
- **StlSet** (const **StlSet** &source)
Copy constructor - copies the content of the given set into this one.
- **StlSet** (const **Collection**< E > &source)
Copy constructor - copies the content of the given set into this one.
- virtual **~StlSet** ()
- **Iterator**< E > * **iterator** ()
Returns:
an iterator over a set of elements of type T.
- **Iterator**< E > * **iterator** () const
- virtual bool **equals** (const **StlSet** &source) const
Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.
Returns:
true if the Collections contain the same elements.
- virtual void **copy** (const **StlSet** &source)
- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)
*Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1490) operation. Most implementations will probably choose to override this method for efficiency.
Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*
Exceptions:
***UnsupportedOperationException** if the clear operation is not supported by this collection*

- virtual bool **contains** (const E &value) const throw (lang::Exception)

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value - the value whose presence is to be queried for in this **Collection** (p. 871).

Returns:

true if the value is contained in this collection

Exceptions:

Exception if an error occurs,

- virtual bool **isEmpty** () const
- virtual std::size_t **size** () const
- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 871) classes should clearly specify in their documentation any restrictions on what elements may be added.*

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value - reference to the element to add.

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

***UnsupportedOperationException** if the remove operation is not supported by this collection.*

***IllegalArgumentException** If the value is not a valid entry for this **Collection** (p. 871).*

6.520.1 Detailed Description

```
template<typename E> class decaf::util::StlSet< E >
```

Set (p. 2320) template that wraps around a `std::set` to provide a more user-friendly interface and to provide common functions that do not exist in `std::set`.

6.520.2 Constructor & Destructor Documentation

```
6.520.2.1  template<typename E> decaf::util::StlSet< E >::StlSet () [inline]
```

Default constructor - does nothing.

```
6.520.2.2  template<typename E> decaf::util::StlSet< E >::StlSet (const StlSet< E  
> & source) [inline]
```

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

```
6.520.2.3  template<typename E> decaf::util::StlSet< E >::StlSet (const  
Collection< E > & source) [inline]
```

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

```
6.520.2.4  template<typename E> virtual decaf::util::StlSet< E >::~StlSet ()  
[inline, virtual]
```

6.520.3 Member Function Documentation

```
6.520.3.1  template<typename E> virtual bool decaf::util::StlSet< E >::add (const  
E & value) throw ( lang::exceptions::UnsupportedOperationException,  
lang::exceptions::IllegalArgumentException,  
lang::exceptions::IllegalStateException ) [inline,  
virtual]
```

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 871) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value - reference to the element to add.

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p. 873).

```
6.520.3.2  template<typename E> virtual void decaf::util::StlSet< E >::clear ()  
          throw ( lang::exceptions::UnsupportedOperationException ) [inline,  
          virtual]
```

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1490) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 127).

6.520.3.3 `template<typename E> virtual bool decaf::util::StlSet< E >::contains (const E & value) const throw (lang::Exception) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value - the value whose presence is to be queried for in this **Collection** (p. 871).

Returns:

true if the value is contained in this collection

Exceptions:

Exception if an error occurs,

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 127).

6.520.3.4 `template<typename E> virtual void decaf::util::StlSet< E >::copy (const StlSet< E > & source) [inline, virtual]`

Referenced by `decaf::util::StlSet< ActiveMQSession * >::StlSet()`.

6.520.3.5 `template<typename E> virtual bool decaf::util::StlSet< E >::equals (const StlSet< E > & source) const [inline, virtual]`

Compares the passed collection to this one, if they contain the same elements, i.e.

all their elements are equivalent, then it returns true.

Returns:

true if the Collections contain the same elements.

Implements **decaf::util::Collection< E >** (p. 875).

6.520.3.6 `template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty () const [inline, virtual]`

Returns:

if the set contains any element or not, TRUE or FALSE

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 129).

6.520.3.7 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () const [inline, virtual]`

Implements **decaf::lang::Iterable< E >** (p. 1487).

6.520.3.8 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator ()`
`[inline, virtual]`

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1487).

6.520.3.9 `template<typename E> virtual bool decaf::util::StlSet<`
`E >::remove (const E & value) throw (`
`lang::exceptions::UnsupportedOperationException,`
`lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 871).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 130).

6.520.3.10 `template<typename E> virtual std::size_t decaf::util::StlSet< E >::size`
`() const [inline, virtual]`

Returns:

The number of elements in this set.

Implements **decaf::util::Collection< E >** (p. 878).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlSet.h`

6.522 activemq::wireformat::stomp::StompFrame Class Reference

A Stomp-level message frame that encloses all messages to and from the broker.

```
#include <src/main/activemq/wireformat/stomp/StompFrame.h>
```

Public Member Functions

- **StompFrame** ()
Default constructor.
- virtual **~StompFrame** ()
Destruction.
- **StompFrame * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- void **copy** (const **StompFrame** *src)
Copies the contents of the passed Frame to this one.
- void **setCommand** (const std::string &cmd)
*Sets the command for this **stomp** (p. 90) frame.*
- const std::string & **getCommand** () const
Accessor for this frame's command field.
- bool **hasProperty** (const std::string &name) const
Checks if the given property is present in the Frame.
- std::string **getProperty** (const std::string &name, const std::string &fallback="") const
Gets a property from this Frame's properties and returns it, or the default value given.
- std::string **removeProperty** (const std::string &name)
Gets and remove the property specified, if the property is not set, this method returns the empty string.
- void **setProperty** (const std::string &name, const std::string &value)
Sets the property given to the value specified in this Frame's Properties.
- **decaf::util::Properties** & **getProperties** ()
Gets access to the header properties for this frame.
- const **decaf::util::Properties** & **getProperties** () const
- const std::vector< unsigned char > & **getBody** () const
Accessor for the body data of this frame.
- std::vector< unsigned char > & **getBody** ()
Non-const version of the body accessor.

- `std::size_t getBodyLength () const`
Return the number of bytes contained in this frames body.
- `void setBody (const unsigned char *bytes, std::size_t numBytes)`
Sets the body data of this frame as a byte sequence.
- `void toStream (decaf::io::DataOutputStream *stream) const throw (decaf::io::IOException)`
Writes this Frame to an OuputStream in the Stomp Wire Format.
- `void fromStream (decaf::io::DataInputStream *stream) throw (decaf::io::IOException)`
Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

6.522.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

6.522.2 Constructor & Destructor Documentation

6.522.2.1 `activemq::wireformat::stomp::StompFrame::StompFrame () [inline]`

Default constructor.

6.522.2.2 `virtual activemq::wireformat::stomp::StompFrame::~~StompFrame () [inline, virtual]`

Destruction.

6.522.3 Member Function Documentation

6.522.3.1 `StompFrame* activemq::wireformat::stomp::StompFrame::clone () const`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

6.522.3.2 `void activemq::wireformat::stomp::StompFrame::copy (const StompFrame * src)`

Copies the contents of the passed Frame to this one.

Parameters:

src - Frame to copy

6.522.3.3 `void activemq::wireformat::stomp::StompFrame::fromStream
(decaf::io::DataInputStream * stream) throw (decaf::io::IOException)`

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

Parameters:

stream - The stream to read the Frame from.

Exceptions:

IOException if an error occurs while writing the Frame.

6.522.3.4 `std::vector<unsigned char>& ac-
tivemq::wireformat::stomp::StompFrame::getBody ()
[inline]`

Non-const version of the body accessor.

6.522.3.5 `const std::vector<unsigned char>& ac-
tivemq::wireformat::stomp::StompFrame::getBody () const
[inline]`

Accessor for the body data of this frame.

Returns:

char pointer to body data

6.522.3.6 `std::size_t activemq::wireformat::stomp::StompFrame::getBodyLength ()
const [inline]`

Return the number of bytes contained in this frames body.

Returns:

Body bytes length.

6.522.3.7 `const std::string& ac-
tivemq::wireformat::stomp::StompFrame::getCommand ()
const [inline]`

Accessor for this frame's command field.

6.522.3.8 `const decaf::util::Properties& ac-
tivemq::wireformat::stomp::StompFrame::getProperties ()
const [inline]`

6.522.3.9 `decaf::util::Properties& ac-
tivemq::wireformat::stomp::StompFrame::getProperties ()
[inline]`

Gets access to the header properties for this frame.

Returns:

the Properties object owned by this Frame

6.522.3.10 `std::string activemq::wireformat::stomp::StompFrame::getProperty
(const std::string & name, const std::string & fallback = "") const`
[inline]

Gets a property from this Frame's properties and returns it, or the default value given.

Parameters:

name - The name of the property to lookup

fallback - The default value to return if this value isn't set

Returns:

string value of the property asked for.

6.522.3.11 `bool activemq::wireformat::stomp::StompFrame::hasProperty (const
std::string & name) const` [inline]

Checks if the given property is present in the Frame.

Parameters:

name - The name of the property to check for.

6.522.3.12 `std::string activemq::wireformat::stomp::StompFrame::removeProperty
(const std::string & name)` [inline]

Gets and remove the property specified, if the property is not set, this method returns the empty string.

Parameters:

name - the Name of the property to get and return.

6.522.3.13 `void activemq::wireformat::stomp::StompFrame::setBody (const
unsigned char * bytes, std::size_t numBytes)`

Sets the body data of this frame as a byte sequence.

Parameters:

bytes The byte buffer to be set in the body.

numBytes The number of bytes in the buffer.

6.522.3.14 `void activemq::wireformat::stomp::StompFrame::setCommand (const std::string & cmd) [inline]`

Sets the command for this **stomp** (p. 90) frame.

Parameters:

cmd command The command to be set.

6.522.3.15 `void activemq::wireformat::stomp::StompFrame::setProperty (const std::string & name, const std::string & value) [inline]`

Sets the property given to the value specified in this Frame's Properties.

Parameters:

name - Name of the property.

value - Value to set the property to.

6.522.3.16 `void activemq::wireformat::stomp::StompFrame::toStream (decaf::io::DataOutputStream * stream) const throw (decaf::io::IOException)`

Writes this Frame to an OuputStream in the Stomp Wire Format.

Parameters:

stream - The stream to write the Frame to.

Exceptions:

IOException if an error occurs while reading the Frame.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompFrame.h`

6.523 activemq::wireformat::stomp::StompHelper Class Reference

Utility Methods used when marshaling to and from StompFrame's.

```
#include <src/main/activemq/wireformat/stomp/StompHelper.h>
```

Public Member Functions

- **StompHelper** ()
- virtual **~StompHelper** ()
- void **convertProperties** (const **Pointer**< **StompFrame** > &frame, const **Pointer**< **Message** > &message)

Converts the Headers in a Stomp Frame into Headers in the given Message Command.
- void **convertProperties** (const **Pointer**< **Message** > &message, const **Pointer**< **StompFrame** > &frame)

*Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2456).*
- **Pointer**< **ActiveMQDestination** > **convertDestination** (const std::string &destination)

Converts from a Stomp Destination to an ActiveMQDestination.
- std::string **convertDestination** (const **Pointer**< **ActiveMQDestination** > &destination)

Converts from a ActiveMQDestination to a Stomp Destination Name.
- std::string **convertMessageId** (const **Pointer**< **MessageId** > &messageId)

Converts a MessageId instance to a Stomp MessageId String.
- **Pointer**< **MessageId** > **convertMessageId** (const std::string &messageId)

Converts a Stomp MessageId string to a MessageId.
- std::string **convertConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)

Converts a ConsumerId instance to a Stomp ConsumerId String.
- **Pointer**< **ConsumerId** > **convertConsumerId** (const std::string &consumerId)

Converts a Stomp ConsumerId string to a ConsumerId.
- std::string **convertProducerId** (const **Pointer**< **ProducerId** > &producerId)

Converts a ProducerId instance to a Stomp ProducerId String.
- **Pointer**< **ProducerId** > **convertProducerId** (const std::string &producerId)

Converts a Stomp ProducerId string to a ProducerId.
- std::string **convertTransactionId** (const **Pointer**< **TransactionId** > &transactionId)

Converts a TransactionId instance to a Stomp TransactionId String.
- **Pointer**< **TransactionId** > **convertTransactionId** (const std::string &transactionId)

Converts a Stomp TransactionId string to a TransactionId.

6.523.1 Detailed Description

Utility Methods used when marshaling to and from StompFrame's.

Since:

3.0

6.523.2 Constructor & Destructor Documentation

6.523.2.1 `activemq::wireformat::stomp::StompHelper::StompHelper () [inline]`

6.523.2.2 `virtual activemq::wireformat::stomp::StompHelper::~~StompHelper () [inline, virtual]`

6.523.3 Member Function Documentation

6.523.3.1 `Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId (const std::string & consumerId)`

Converts a Stomp ConsumerId string to a ConsumerId.

Parameters:

consumerId - the String Consumer Id to convert.

Returns:

Pointer to a new ConsumerId.

6.523.3.2 `std::string activemq::wireformat::stomp::StompHelper::convertConsumerId (const Pointer< ConsumerId > & consumerId)`

Converts a ConsumerId instance to a Stomp ConsumerId String.

Parameters:

consumerId - the Consumer instance to convert.

Returns:

a Stomp Consumer Id String.

6.523.3.3 `std::string activemq::wireformat::stomp::StompHelper::convertDestination (const Pointer< ActiveMQDestination > & destination)`

Converts from a ActiveMQDestination to a Stomp Destination Name.

Parameters:

destination - The ActiveMQDestination to Convert

Returns:

the Stomp String name that defines the destination.

6.523.3.4 `Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination (const std::string & destination)`

Converts from a Stomp Destination to an ActiveMQDestination.

Parameters:

destination - The Stomp Destination name string.

Returns:

Pointer to a new ActiveMQDestination.

6.523.3.5 `Pointer<MessageId> activemq::wireformat::stomp::StompHelper::convertMessageId (const std::string & messageId)`

Converts a Stomp MessageId string to a MessageId.

Parameters:

messageId - the String message Id to convert.

Returns:

Pointer to a new MessageId.

6.523.3.6 `std::string activemq::wireformat::stomp::StompHelper::convertMessageId (const Pointer< MessageId > & messageId)`

Converts a MessageId instance to a Stomp MessageId String.

Parameters:

messageId - the MessageId instance to convert.

Returns:

a Stomp Message Id String.

6.523.3.7 `Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId (const std::string & producerId)`

Converts a Stomp ProducerId string to a ProducerId.

Parameters:

producerId - the String Producer Id to convert.

Returns:

Pointer to a new ProducerId.

6.523.3.8 `std::string activemq::wireformat::stomp::StompHelper::convertProducerId (const Pointer< ProducerId > & producerId)`

Converts a ProducerId instance to a Stomp ProducerId String.

Parameters:

producerId - the Producer instance to convert.

Returns:

a Stomp Producer Id String.

6.523.3.9 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< Message > & message, const Pointer< StompFrame > & frame)`

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2456).

Parameters:

message - The message to move the Headers to.

frame - The frame to extract headers from.

6.523.3.10 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< StompFrame > & frame, const Pointer< Message > & message)`

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

Parameters:

frame - The frame to extract headers from.

message - The message to move the Headers to.

6.523.3.11 `Pointer<TransactionId> activemq::wireformat::stomp::StompHelper::convertTransactionId (const std::string & transactionId)`

Converts a Stomp TransactionId string to a TransactionId.

Parameters:

transactionId - the String Transaction Id to convert.

Returns:

Pointer to a new TransactionId.

6.523.3.12 `std::string activemq::wireformat::stomp::StompHelper::convertTransactionId (const Pointer< TransactionId > & transactionId)`

Converts a TransactionId instance to a Stomp TransactionId String.

Parameters:

transactionId - the Transaction instance to convert.

Returns:

a Stomp Transaction Id String.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompHelper.h`

6.524 activemq::wireformat::stomp::StompWireFormat Class Reference

#include <src/main/activemq/wireformat/stomp/StompWireFormat.h> Inheritance diagram for activemq::wireformat::stomp::StompWireFormat:

Public Member Functions

- **StompWireFormat** ()
- virtual **~StompWireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out) throw (**decaf::io::IOException**)

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in) throw (**decaf::io::IOException**)

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

- virtual void **setVersion** (int version **AMQCPP_UNUSED**)

Set the Version.

- virtual int **getVersion** () const

Get the Version.

- virtual bool **hasNegotiator** () const

*Returns true if this **WireFormat** (p. 2693) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport) throw (**decaf::lang::exceptions::UnsupportedOperationException**)

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

6.524.1 Constructor & Destructor Documentation

6.524.1.1 `activemq::wireformat::stomp::StompWireFormat::StompWireFormat ()`

6.524.1.2 `virtual
activemq::wireformat::stomp::StompWireFormat::~~StompWireFormat ()
[virtual]`

6.524.2 Member Function Documentation

6.524.2.1 `virtual Pointer<transport::Transport> ac-
tivemq::wireformat::stomp::StompWireFormat::createNegotiator
(const Pointer< transport::Transport > & transport) throw (
decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns:

new instance of a **WireFormatNegotiator** (p. 2721).

Exceptions:

UnsupportedOperationException if the **WireFormat** (p. 2693) doesn't have a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2694).

6.524.2.2 `virtual int activemq::wireformat::stomp::StompWireFormat::getVersion
() const [inline, virtual]`

Get the Version.

Returns:

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 2694).

6.524.2.3 `virtual bool ac-
tivemq::wireformat::stomp::StompWireFormat::hasNegotiator () const
[inline, virtual]`

Returns true if this **WireFormat** (p. 2693) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 2693) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2694).

6.524.2.4 `virtual void activemq::wireformat::stomp::StompWireFormat::marshal (const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out) throw (decaf::io::IOException)` [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal to the output stream.
transport (p. 67) The Transport that initiated this marshal call.
out The output stream to write the command to.

Exceptions:

IOException

Implements `activemq::wireformat::WireFormat` (p. 2695).

6.524.2.5 `virtual void activemq::wireformat::stomp::StompWireFormat::setVersion (int version AMQCPP_UNUSED)` [inline, virtual]

Set the Version.

Parameters:

the version of the wire format

Implements `activemq::wireformat::WireFormat` (p. 2695).

6.524.2.6 `virtual Pointer<commands::Command> activemq::wireformat::stomp::StompWireFormat::unmarshal (const activemq::transport::Transport * transport, decaf::io::DataInputStream * in) throw (decaf::io::IOException)` [virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form. Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport (p. 67) - Pointer to the `transport` (p. 67) that is making this request.
in - the input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException

Implements `activemq::wireformat::WireFormat` (p. 2695).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompWireFormat.h`

6.525 activemq::wireformat::stomp::StompWireFormatFactory Class Reference

Factory used to create the Stomp Wire Format instance.

#include <src/main/activemq/wireformat/stomp/StompWireFormatFactory.h> Inheritance diagram for activemq::wireformat::stomp::StompWireFormatFactory:

tivemq::wireformat::stomp::StompWireFormatFactory::createWireFormat
 (const **decaf::util::Properties** & *properties*) throw (
decaf::lang::exceptions::IllegalStateException) [virtual]

Creates a new **WireFormat** (p. 2693) Object passing it a set of properties from which it can obtain any optional settings.

Parameters:

properties - the Properties for this **WireFormat** (p. 2693)

Implements **activemq::wireformat::WireFormatFactory** (p. 2697).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompWireFormatFactory.h**

6.526 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

#include <src/main/cms/Stoppable.h> Inheritance diagram for cms::Stoppable:

Public Member Functions

- virtual **~Stoppable** ()
- virtual void **stop** ()=0 throw (CMSEException)
Stops this service.

6.526.1 Detailed Description

Interface for a class that implements the stop method. An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

Since:

1.0

6.526.2 Constructor & Destructor Documentation

6.526.2.1 virtual cms::Stoppable::~~Stoppable () [inline, virtual]

6.526.3 Member Function Documentation

6.526.3.1 virtual void cms::Stoppable::stop () throw (CMSEException) [pure virtual]

Stops this service.

Exceptions:

CMSEException (p. 850) - if an internal error occurs while stopping the Service.

Implemented in **activemq::core::ActiveMQConnection** (p. 199).

The documentation for this class was generated from the following file:

- src/main/cms/**Stoppable.h**

6.527 decaf::util::logging::StreamHandler Class Reference

#include <src/main/decaf/util/logging/StreamHandler.h> Inheritance diagram for decaf::util::logging::StreamHandler:

Public Member Functions

- **StreamHandler** ()
*Create a **StreamHandler** (p. 2472), with no current output stream.*
- **StreamHandler** (io::OutputStream *stream, Formatter *formatter)
*Create a **StreamHandler** (p. 2472), with no current output stream.*
- virtual ~**StreamHandler** ()
- virtual void **close** () throw (cms::CMSEException)
Close the current output stream.
- virtual void **flush** ()
Flush the Handler's output, clears any buffers.
- virtual void **publish** (const **LogRecord** &record)
*Publish the Log Record to this **Handler** (p. 1382).*
- virtual void **isLoggable** (const **LogRecord** &record)
*Check if this **Handler** (p. 1382) would actually log a given **LogRecord** (p. 1645).*
- virtual void **setFilter** (const **Filter** *filter)
*Sets the **Filter** (p. 1314) that this **Handler** (p. 1382) uses to filter Log Records.*
- virtual const **Filter** * **getFilter** ()
*Gets the **Filter** (p. 1314) that this **Handler** (p. 1382) uses to filter Log Records.*
- virtual void **setLevel** (**Level** level)
***Set** (p. 2320) the log level specifying which message levels will be logged by this **Handler** (p. 1382).*
- virtual **Level** **getLevel** ()
*Get the log level specifying which message levels will be logged by this **Handler** (p. 1382).*
- virtual void **setFormatter** (const **Formatter** *formatter)
*Sets the **Formatter** (p. 1372) used by this **Handler** (p. 1382).*
- virtual const **Formatter** * **getFormatter** ()
*Gets the **Formatter** (p. 1372) used by this **Handler** (p. 1382).*
- virtual io::OutputStream * **getOutputStream** () const
*Gets the output Stream that this **Handler** (p. 1382) is using.*

6.527.1 Constructor & Destructor Documentation

6.527.1.1 decaf::util::logging::StreamHandler::StreamHandler () [inline]

Create a **StreamHandler** (p. 2472), with no current output stream.

6.527.1.2 decaf::util::logging::StreamHandler::StreamHandler (io::OutputStream * *stream*, Formatter * *formatter*) [inline]

Create a **StreamHandler** (p. 2472), with no current output stream.

References decaf::util::logging::Fatal.

6.527.1.3 virtual decaf::util::logging::StreamHandler::~StreamHandler () [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.527.2 Member Function Documentation

6.527.2.1 virtual void decaf::util::logging::StreamHandler::close () throw (cms::CMSException) [inline, virtual]

Close the current output stream. The close method will perform a flush and then close the **Handler** (p. 1382). After close has been called this **Handler** (p. 1382) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

Exceptions:

CMSException

Implements decaf::io::Closeable (p. 840).

6.527.2.2 virtual void decaf::util::logging::StreamHandler::flush () [inline, virtual]

Flush the Handler's output, clears any buffers.

Implements decaf::util::logging::Handler (p. 1383).

6.527.2.3 virtual const Filter* decaf::util::logging::StreamHandler::getFilter () [inline, virtual]

Gets the **Filter** (p. 1314) that this **Handler** (p. 1382) uses to filter Log Records.

Returns:

Filter (p. 1314) derived instance

Implements decaf::util::logging::Handler (p. 1383).

6.527.2.4 `virtual const Formatter* decaf::util::logging::StreamHandler::getFormatter ()`
[inline, virtual]

Gets the `Formatter` (p. 1372) used by this **Handler** (p. 1382).

Returns:

currently configured `Formatter` (p. 1372) derived instance

Implements `decaf::util::logging::Handler` (p. 1383).

6.527.2.5 `virtual Level decaf::util::logging::StreamHandler::getLevel ()` [inline, virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1382).

Returns:

Currently set `Level` enumeration value

Implements `decaf::util::logging::Handler` (p. 1383).

6.527.2.6 `virtual io::OutputStream* decaf::util::logging::StreamHandler::getOutputStream ()`
`const` [inline, virtual]

Gets the output `Stream` that this **Handler** (p. 1382) is using.

Returns:

`OutputStream` pointer used by this handler.

6.527.2.7 `virtual void decaf::util::logging::StreamHandler::isLoggable (const LogRecord & record)` [inline, virtual]

Check if this **Handler** (p. 1382) would actually log a given **LogRecord** (p. 1645).

Parameters:

record `LogRecord` (p. 1645) to check

Implements `decaf::util::logging::Handler` (p. 1383).

6.527.2.8 `virtual void decaf::util::logging::StreamHandler::publish (const LogRecord & record)` [inline, virtual]

Publish the `Log Record` to this **Handler** (p. 1382).

Parameters:

record The `LogRecord` (p. 1645) to Publish

Implements `decaf::util::logging::Handler` (p. 1384).

References `DECAF_CATCH_RETHROW`, and `DECAF_CATCHALL_THROW`.

6.527.2.9 virtual void decaf::util::logging::StreamHandler::setFilter (const Filter * *filter*) [inline, virtual]

Sets the **Filter** (p. 1314) that this **Handler** (p. 1382) uses to filter Log Records.

Parameters:

filter Filter (p. 1314) derived instance

Implements **decaf::util::logging::Handler** (p. 1384).

6.527.2.10 virtual void decaf::util::logging::StreamHandler::setFormatter (const Formatter * *formatter*) [inline, virtual]

Sets the **Formatter** (p. 1372) used by this **Handler** (p. 1382).

Parameters:

formatter Formatter (p. 1372) derived instance

Implements **decaf::util::logging::Handler** (p. 1384).

6.527.2.11 virtual void decaf::util::logging::StreamHandler::setLevel (Level *level*) [inline, virtual]

Set (p. 2320) the log level specifying which message levels will be logged by this **Handler** (p. 1382). The intention is to allow developers to turn on verbose **logging** (p. 120), but to limit the messages that are sent to certain Handlers.

Parameters:

level Level enumeration value

Implements **decaf::util::logging::Handler** (p. 1384).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

6.528 cms::StreamMessage Class Reference

Interface for a **StreamMessage** (p. 2476).

#include <src/main/cms/StreamMessage.h> Inheritance diagram for cms::StreamMessage:

Public Member Functions

- virtual **~StreamMessage** ()
- virtual bool **readBoolean** () const =0 throw (cms::CMSEException)
Reads a Boolean from the Stream message stream.
- virtual void **writeBoolean** (bool value)=0 throw (cms::CMSEException)
Writes a boolean to the Stream message stream as a 1-byte value.
- virtual unsigned char **readByte** () const =0 throw (cms::CMSEException)
Reads a Byte from the Stream message stream.
- virtual void **writeByte** (unsigned char value)=0 throw (cms::CMSEException)
Writes a byte to the Stream message stream as a 1-byte value.
- virtual std::size_t **readBytes** (std::vector< unsigned char > &value) const =0 throw (cms::CMSEException)
Reads a byte array from the Stream message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0 throw (cms::CMSEException)
Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.
- virtual std::size_t **readBytes** (unsigned char *&buffer, std::size_t length) const =0 throw (cms::CMSEException)
Reads a portion of the Stream message stream.
- virtual void **writeBytes** (const unsigned char *value, std::size_t offset, std::size_t length)=0 throw (cms::CMSEException)
Writes a portion of a byte array to the Stream message stream.
- virtual char **readChar** () const =0 throw (cms::CMSEException)
Reads a Char from the Stream message stream.
- virtual void **writeChar** (char value)=0 throw (cms::CMSEException)
Writes a char to the Stream message stream as a 1-byte value.
- virtual float **readFloat** () const =0 throw (cms::CMSEException)
Reads a 32 bit float from the Stream message stream.
- virtual void **writeFloat** (float value)=0 throw (cms::CMSEException)

Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () const =0 throw (cms::CMSEException)
Reads a 64 bit double from the Stream message stream.
- virtual void **writeDouble** (double value)=0 throw (cms::CMSEException)
Writes a double to the Stream message stream as a 8 byte value.
- virtual short **readShort** () const =0 throw (cms::CMSEException)
Reads a 16 bit signed short from the Stream message stream.
- virtual void **writeShort** (short value)=0 throw (cms::CMSEException)
Writes a signed short to the Stream message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const =0 throw (cms::CMSEException)
Reads a 16 bit unsigned short from the Stream message stream.
- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (cms::CMSEException)
Writes a unsigned short to the Stream message stream as a 2 byte value.
- virtual int **readInt** () const =0 throw (cms::CMSEException)
Reads a 32 bit signed integer from the Stream message stream.
- virtual void **writeInt** (int value)=0 throw (cms::CMSEException)
Writes a signed int to the Stream message stream as a 4 byte value.
- virtual long long **readLong** () const =0 throw (cms::CMSEException)
Reads a 64 bit long from the Stream message stream.
- virtual void **writeLong** (long long value)=0 throw (cms::CMSEException)
Writes a long long to the Stream message stream as a 8 byte value.
- virtual std::string **readString** () const =0 throw (cms::CMSEException)
Reads an ASCII String from the Stream message stream.
- virtual void **writeString** (const std::string &value)=0 throw (cms::CMSEException)
Writes an ASCII String to the Stream message stream.

6.528.1 Detailed Description

Interface for a **StreamMessage** (p. 2476). The stream Messages provides a **Message** (p. 1753) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

StreamMessage (p. 2476) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p. 850). The string-to-primitive conversions may throw a runtime exception if the primitive's `valueOf()` method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X									X
byte		X	X		X	X				X
short			X		X	X				X
char				X						X
int					X	X				X
long						X				X
float							X	X		X
double								X		X
String	X	X	X		X	X	X	X	X	
byte[]										X

Since:

1.3

6.528.2 Constructor & Destructor Documentation

6.528.2.1 `virtual cms::StreamMessage::~StreamMessage () [inline, virtual]`

6.528.3 Member Function Documentation

6.528.3.1 `virtual bool cms::StreamMessage::readBoolean () const throw (cms::CMSEException) [pure virtual]`

Reads a Boolean from the Stream message stream.

Returns:

boolean value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 378).

6.528.3.2 `virtual unsigned char cms::StreamMessage::readByte () const throw (cms::CMSEException) [pure virtual]`

Reads a Byte from the Stream message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 378).

6.528.3.3 `virtual std::size_t cms::StreamMessage::readBytes (unsigned char *&buffer, std::size_t length) const throw (cms::CMSException) [pure virtual]`

Reads a portion of the Stream message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p. 850) is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 379).

6.528.3.4 `virtual std::size_t cms::StreamMessage::readBytes (std::vector< unsigned char > &value) const throw (cms::CMSException) [pure virtual]`

Reads a byte array from the Stream message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 379).

6.528.3.5 `virtual char cms::StreamMessage::readChar () const throw (cms::CMSEException)` [pure virtual]

Reads a Char from the Stream message stream.

Returns:

char value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 380).

6.528.3.6 `virtual double cms::StreamMessage::readDouble () const throw (cms::CMSEException)` [pure virtual]

Reads a 64 bit double from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 380).

6.528.3.7 virtual float cms::StreamMessage::readFloat () const throw (cms::CMSEException) [pure virtual]

Reads a 32 bit float from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 380).

6.528.3.8 virtual int cms::StreamMessage::readInt () const throw (cms::CMSEException) [pure virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns:

int value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 381).

6.528.3.9 virtual long long cms::StreamMessage::readLong () const throw (cms::CMSEException) [pure virtual]

Reads a 64 bit long from the Stream message stream.

Returns:

long long value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 381).

6.528.3.10 virtual short cms::StreamMessage::readShort () const throw (cms::CMSEException) [pure virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns:

short value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 381).

6.528.3.11 virtual std::string cms::StreamMessage::readString () const throw (cms::CMSEException) [pure virtual]

Reads an ASCII String from the Stream message stream.

Returns:

String from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 381).

6.528.3.12 virtual unsigned short cms::StreamMessage::readUnsignedShort () const throw (cms::CMSException) [pure virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of message stream has been reached.

MessageFormatException (p. 1842) - if this type conversion is invalid.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 382).

6.528.3.13 virtual void cms::StreamMessage::writeBoolean (bool value) throw (cms::CMSException) [pure virtual]

Writes a boolean to the Stream message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value boolean to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 382).

6.528.3.14 virtual void cms::StreamMessage::writeByte (unsigned char value) throw (cms::CMSException) [pure virtual]

Writes a byte to the Stream message stream as a 1-byte value.

Parameters:

value byte to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 383).

6.528.3.15 `virtual void cms::StreamMessage::writeBytes (const unsigned char * value, std::size_t offset, std::size_t length) throw (cms::CMSException)` [pure virtual]

Writes a portion of a byte array to the Stream message stream. size as the number of bytes to write.

Parameters:

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 383).

6.528.3.16 `virtual void cms::StreamMessage::writeBytes (const std::vector< unsigned char > & value) throw (cms::CMSException)` [pure virtual]

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters:

value bytes to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 383).

6.528.3.17 virtual void cms::StreamMessage::writeChar (char *value*) throw (cms::CMSException) [pure virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters:

value char to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 384).

6.528.3.18 virtual void cms::StreamMessage::writeDouble (double *value*) throw (cms::CMSException) [pure virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters:

value double to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 384).

6.528.3.19 virtual void cms::StreamMessage::writeFloat (float *value*) throw (cms::CMSException) [pure virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters:

value float to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 384).

6.528.3.20 `virtual void cms::StreamMessage::writeInt (int value) throw (cms::CMSException)` [pure virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters:

value signed int to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 384).

6.528.3.21 `virtual void cms::StreamMessage::writeLong (long long value) throw (cms::CMSException)` [pure virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters:

value signed long long to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 385).

6.528.3.22 `virtual void cms::StreamMessage::writeShort (short value) throw (cms::CMSException)` [pure virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters:

value signed short to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 385).

6.528.3.23 `virtual void cms::StreamMessage::writeString (const std::string &value) throw (cms::CMSException)` [pure virtual]

Writes an ASCII String to the Stream message stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 385).

6.528.3.24 `virtual void cms::StreamMessage::writeUnsignedShort (unsigned short value) throw (cms::CMSException)` [pure virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters:

value unsigned short to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQStreamMessage` (p. 385).

The documentation for this class was generated from the following file:

- `src/main/cms/StreamMessage.h`

6.529 decaf::util::StringTokenizer Class Reference

```
#include <src/main/decaf/util/StringTokenizer.h>
```

Public Member Functions

- **StringTokenizer** (const std::string &str, const std::string &delim=" \t\n\r\f", bool returnDelims=false)
Constructs a string tokenizer for the specified string.
- virtual ~**StringTokenizer** ()
- virtual int **countTokens** () const
Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.
- virtual bool **hasMoreTokens** () const
Tests if there are more tokens available from this tokenizer's string.
- virtual std::string **nextToken** () throw (lang::exceptions::NoSuchElementException)
Returns the next token from this string tokenizer.
- virtual std::string **nextToken** (const std::string &delim) throw (lang::exceptions::NoSuchElementException)
Returns the next token in this string tokenizer's string.
- virtual unsigned int **toArray** (std::vector< std::string > &array)
Grab all remaining tokens in the String and return them in the vector that is passed in by reference.
- virtual void **reset** (const std::string &str="", const std::string &delim="", bool returnDelims=false)
Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

6.529.1 Constructor & Destructor Documentation

6.529.1.1 decaf::util::StringTokenizer::StringTokenizer (const std::string & str, const std::string & delim = " \t\n\r\f", bool returnDelims = false)

Constructs a string tokenizer for the specified string. All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if delim is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p. 2488) may result in an Exception.

Parameters:

str - The string to tokenize

delim - String containing the delimiters

returnDelims - boolean indicating if the delimiters are returned as tokens

6.529.1.2 virtual decaf::util::StringTokenizer::~~StringTokenizer () [virtual]

6.529.2 Member Function Documentation

6.529.2.1 virtual int decaf::util::StringTokenizer::countTokens () const [virtual]

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception. The current position is not advanced.

Returns:

Count of remaining tokens

6.529.2.2 virtual bool decaf::util::StringTokenizer::hasMoreTokens () const [virtual]

Tests if there are more tokens available from this tokenizer's string.

Returns:

true if there are more tokens remaining

6.529.2.3 virtual std::string decaf::util::StringTokenizer::nextToken (const std::string & *delim*) throw (lang::exceptions::NoSuchElementException) [virtual]

Returns the next token in this string tokenizer's string. First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 2488) object is changed to be the characters in the string *delim*. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

Parameters:

delim - string containing the new set of delimiters

Returns:

next string in the token list

Exceptions:

NoSuchElementException

6.529.2.4 virtual std::string decaf::util::StringTokenizer::nextToken () throw (lang::exceptions::NoSuchElementException) [virtual]

Returns the next token from this string tokenizer.

Returns:

string value of next token

Exceptions:

NoSuchElementException

6.529.2.5 `virtual void decaf::util::StringTokenizer::reset (const std::string & str = "", const std::string & delim = "", bool returnDelims = false) [virtual]`

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning. This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing. If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made. If set the delim param will reset the string that this Tokenizer is using to tokenizer the string. If set to "", no change is made If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

Parameters:

str - New String to tokenize or "", defaults to ""

delim - New Delimiter String to use or "", defaults to ""

returnDelims - Should the Tokenizer return delimiters as Tokens, default false

6.529.2.6 `virtual unsigned int decaf::util::StringTokenizer::toArray (std::vector< std::string > & array) [virtual]`

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

Parameters:

array - vector to place token strings in

Returns:

number of string placed into the vector

6.530.1 Constructor & Destructor Documentation

- 6.530.1.1** **activemq::commands::SubscriptionInfo::SubscriptionInfo** (const **SubscriptionInfo** &) [inline, protected]
- 6.530.1.2** **activemq::commands::SubscriptionInfo::SubscriptionInfo** ()
- 6.530.1.3** **virtual activemq::commands::SubscriptionInfo::~~SubscriptionInfo** () [virtual]

6.530.2 Member Function Documentation

- 6.530.2.1** **virtual SubscriptionInfo* activemq::commands::SubscriptionInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

- 6.530.2.2** **virtual void activemq::commands::SubscriptionInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

- 6.530.2.3** **virtual bool activemq::commands::SubscriptionInfo::equals** (const **DataStructure** * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.530.2.4 virtual std::string& activemq::commands::SubscriptionInfo::getClientId () [virtual]

6.530.2.5 virtual const std::string& activemq::commands::SubscriptionInfo::getClientId () const [virtual]

6.530.2.6 virtual unsigned char activemq::commands::SubscriptionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.530.2.7 `virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination ()`
[virtual]
- 6.530.2.8 `virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination () const`
[virtual]
- 6.530.2.9 `virtual std::string& activemq::commands::SubscriptionInfo::getSelector ()`
[virtual]
- 6.530.2.10 `virtual const std::string& activemq::commands::SubscriptionInfo::getSelector () const`
[virtual]
- 6.530.2.11 `virtual std::string& activemq::commands::SubscriptionInfo::getSubscriptionName ()`
[virtual]
- 6.530.2.12 `virtual const std::string& activemq::commands::SubscriptionInfo::getSubscriptionName () const`
[virtual]
- 6.530.2.13 `virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination ()`
[virtual]
- 6.530.2.14 `virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination () const` [virtual]
- 6.530.2.15 `SubscriptionInfo& activemq::commands::SubscriptionInfo::operator=(const SubscriptionInfo &)` [inline, protected]
- 6.530.2.16 `virtual void activemq::commands::SubscriptionInfo::setClientId (const std::string & clientId)` [virtual]
- 6.530.2.17 `virtual void activemq::commands::SubscriptionInfo::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.530.2.18 `virtual void activemq::commands::SubscriptionInfo::setSelector (const std::string & selector)` [virtual]
- 6.530.2.19 `virtual void activemq::commands::SubscriptionInfo::setSubscriptionName (const std::string & subscriptionName)` [virtual]
- 6.530.2.20 `virtual void activemq::commands::SubscriptionInfo::setSubscribedDestination (const Pointer< ActiveMQDestination > & subscribedDestination)` [virtual]
- 6.530.2.21 `virtual std::string activemq::commands::SubscriptionInfo::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 560).

6.530.3 Field Documentation

Write a object instance to data output stream.

6.531.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2496). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.531.2 Constructor & Destructor Documentation

6.531.2.1 `activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller()` [inline]

6.531.2.2 `virtual activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller()` [inline, virtual]

6.531.3 Member Function Documentation

6.531.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.531.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.531.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.531.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.531.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.531.3.6 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.531.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.532.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2500). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.532.2 Constructor & Destructor Documentation

6.532.2.1 `activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller()` `[inline]`

6.532.2.2 `virtual activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller()` `[inline, virtual]`

6.532.3 Member Function Documentation

6.532.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.532.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.532.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.532.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.532.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.532.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.532.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.533.3 Member Function Documentation

6.533.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.533.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.533.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.533.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.533.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.533.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.533.3.7 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/SubscriptionInfoMarshaller.h

6.534 decaf::util::concurrent::Synchronizable Class Reference

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

6.536 decaf::lang::System Class Reference

```
#include <src/main/decaf/lang/System.h>
```

Public Member Functions

- **System** ()
- virtual **~System** ()

Static Public Member Functions

- static const **util::Map**< std::string, std::string > & **getenv** () throw (lang::Exception)
Enumerates the system environment and returns a map of env variable names to the string values they hold.
- static std::string **getenv** (const std::string &name) throw (lang::Exception)
Reads an environment value from the system and returns it as a string object.
- static void **unsetenv** (const std::string &name) throw (lang::Exception)
Clears a set env value if one is set.
- static void **setenv** (const std::string &name, const std::string &value) throw (lang::Exception)
Sets the specified system property to the value given.
- static long long **currentTimeMillis** ()
- static long long **nanoTime** ()
Returns the current value of the most precise available system timer, in nanoseconds.

6.536.1 Constructor & Destructor Documentation

6.536.1.1 decaf::lang::System::System ()

6.536.1.2 virtual decaf::lang::System::~~System () [inline, virtual]

6.536.2 Member Function Documentation

6.536.2.1 static long long decaf::lang::System::currentTimeMillis () [static]

Returns:

the current system time in Milliseconds

6.536.2.2 static std::string decaf::lang::System::getenv (const std::string & name) throw (lang::Exception) [static]

Reads an environment value from the system and returns it as a string object.

Parameters:

name - the env var to read

Returns:

a string with the value from the var or ""

Exceptions:

an Exception (p. 1268) if an error occurs while reading the Env.

6.536.2.3 `static const util::Map<std::string, std::string>&
decaf::lang::System::getenv () throw (lang::Exception) [static]`

Enumerates the system environment and returns a map of env variable names to the string values they hold.

Returns:

A Map of all environment variables.

Exceptions:

Exception (p. 1268) if an error occurs

6.536.2.4 `static long long decaf::lang::System::nanoTime () [static]`

Returns the current value of the most precise available system timer, in nanoseconds. This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some code takes to execute:

```
long long startTime = System::nanoTime() (p. 2518); // ... the code being measured ... long
long estimatedTime = System::nanoTime() (p. 2518) - startTime;
```

Returns:

The current value of the system timer, in nanoseconds.

6.536.2.5 `static void decaf::lang::System::setenv (const std::string & name, const
std::string & value) throw (lang::Exception) [static]`

Sets the specified system property to the value given.

Parameters:

name - name of the env val to set

value - value to assign to name

Exceptions:

an Exception (p. 1268) if an error occurs

6.536.2.6 static void decaf::lang::System::unsetenv (const std::string & *name*)
throw (lang::Exception) [static]

Clears a set env value if one is set.

Parameters:

name - the env var to clear

Exceptions:

an Exception (p. 1268) if an error occurs while reading the Env.

6.537 activemq::threads::Task Class Reference

Represents a unit of work that requires one or more iterations to complete.

#include <src/main/activemq/threads/Task.h> Inheritance diagram for activemq::threads::Task:

Public Member Functions

- virtual `~Task()`
- virtual `bool iterate()` = 0

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.537.1 Detailed Description

Represents a unit of work that requires one or more iterations to complete.

Since:

3.0

6.537.2 Constructor & Destructor Documentation

6.537.2.1 virtual `activemq::threads::Task::~~Task()` [inline, virtual]

6.537.3 Member Function Documentation

6.537.3.1 virtual `bool activemq::threads::Task::iterate()` [pure virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns:

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implemented in `activemq::core::ActiveMQSessionExecutor` (p. 371), `activemq::threads::CompositeTaskRunner` (p. 909), `activemq::transport::failover::BackupTransportPool` (p. 506), `activemq::transport::failover::CloseTransportsTask` (p. 842), and `activemq::transport::failover::FailoverTransport` (p. 1302).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/Task.h`

6.538 decaf::util::concurrent::TaskListener Class Reference

```
#include <src/main/decaf/util/concurrent/TaskListener.h>
```

Public Member Functions

- virtual `~TaskListener ()`
- virtual void `onTaskComplete (lang::Runnable *task)=0`
Called when a queued task has completed, the task that finished is passed along for user consumption.
- virtual void `onTaskException (lang::Runnable *task, lang::Exception &ex)=0`
Called when a queued task has thrown an exception while being run.

6.538.1 Constructor & Destructor Documentation

- 6.538.1.1** virtual `decaf::util::concurrent::TaskListener::~~TaskListener ()` [inline, virtual]

6.538.2 Member Function Documentation

- 6.538.2.1** virtual void `decaf::util::concurrent::TaskListener::onTaskComplete (lang::Runnable * task)` [pure virtual]

Called when a queued task has completed, the task that finished is passed along for user consumption.

Parameters:

task Runnable Pointer to the task that finished

- 6.538.2.2** virtual void `decaf::util::concurrent::TaskListener::onTaskException (lang::Runnable * task, lang::Exception & ex)` [pure virtual]

Called when a queued task has thrown an exception while being run. The Callee should assume that this was an unrecoverable exception and that this task is now defunct.

Parameters:

task Runnable Pointer to the task

ex The ActiveMQException that was thrown.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TaskListener.h`

6.539 activemq::threads::TaskRunner Class Reference

#include <src/main/activemq/threads/TaskRunner.h> Inheritance diagram for activemq::threads::TaskRunner:

Public Member Functions

- virtual `~TaskRunner ()`
- virtual void `shutdown (unsigned int timeout)=0`
Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void `shutdown ()=0`
Shutdown once the task has finished and the TaskRunner's thread has exited.
- virtual void `wakeup ()=0`
*Signal the **TaskRunner** (p. 2522) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2520) instance will be run until its iterate method has returned false indicating it is done.*

6.539.1 Constructor & Destructor Documentation

6.539.1.1 virtual `activemq::threads::TaskRunner::~~TaskRunner ()` [inline, virtual]

6.539.2 Member Function Documentation

6.539.2.1 virtual void `activemq::threads::TaskRunner::shutdown ()` [pure virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implemented in `activemq::threads::CompositeTaskRunner` (p. 909), and `activemq::threads::DedicatedTaskRunner` (p. 1184).

6.539.2.2 virtual void `activemq::threads::TaskRunner::shutdown (unsigned int timeout)` [pure virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters:

timeout - Time in Milliseconds to wait for the task to stop.

Implemented in `activemq::threads::CompositeTaskRunner` (p. 910), and `activemq::threads::DedicatedTaskRunner` (p. 1184).

6.539.2.3 virtual void activemq::threads::TaskRunner::wakeup () [pure virtual]

Signal the **TaskRunner** (p. 2522) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2520) instance will be run until its iterate method has returned false indicating it is done.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 910), and **activemq::threads::DedicatedTaskRunner** (p. 1184).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**TaskRunner.h**

6.540 decaf::net::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

#include <src/main/decaf/net/TcpSocket.h>Inheritance diagram for decaf::net::TcpSocket:

Public Member Functions

- **TcpSocket** () throw (SocketException)
Construct a non-connected socket.
- **TcpSocket** (SocketHandle socketHandle)
Construct a connected or bound socket based on given socket handle.
- virtual ~**TcpSocket** ()
Releases the socket handle but not gracefully shut down the connection.
- **SocketHandle** **getSocketHandle** ()
Gets the handle for the socket.
- void **connect** (const char *host, int port, int timeout) throw (SocketException)
Connects to the specified destination.
- virtual void **connect** (const char *host, int port) throw (SocketException)
Connects to the specified destination.
- virtual bool **isConnected** () const
Indicates whether or not this socket is connected to a destination.
- virtual **io::InputStream** * **getInputStream** ()
Gets the InputStream for this socket.
- virtual **io::OutputStream** * **getOutputStream** ()
Gets the OutputStream for this socket.
- virtual int **getSoLinger** () const throw (SocketException)
Gets the linger time.
- virtual void **setSoLinger** (int linger) throw (SocketException)
Sets the linger time.
- virtual bool **getKeepAlive** () const throw (SocketException)
Gets the keep alive flag.
- virtual void **setKeepAlive** (bool keepAlive) throw (SocketException)
Enables/disables the keep alive flag.
- virtual int **getReceiveBufferSize** () const throw (SocketException)

Gets the receive buffer size.

- virtual void **setReceiveBufferSize** (int size) throw (SocketException)
Sets the receive buffer size.
- virtual bool **getReuseAddress** () const throw (SocketException)
Gets the reuse address flag.
- virtual void **setReuseAddress** (bool reuse) throw (SocketException)
Sets the reuse address flag.
- virtual int **getSendBufferSize** () const throw (SocketException)
Gets the send buffer size.
- virtual void **setSendBufferSize** (int size) throw (SocketException)
Sets the send buffer size.
- virtual int **getSoTimeout** () const throw (SocketException)
Gets the timeout for socket operations.
- virtual void **setSoTimeout** (int timeout) throw (SocketException)
Sets the timeout for socket operations.
- virtual void **close** () throw (lang::Exception)
Closes this object and deallocates the appropriate resources.
- virtual bool **getTcpNoDelay** () const throw (lang::Exception)
Gets the Status of the TCP_NODELAY param for this socket as a Bool.
- virtual void **setTcpNoDelay** (bool value) throw (lang::Exception)
Sets the Status of the TCP_NODELAY param for this socket as a Bool.

Protected Member Functions

- void **checkResult** (apr_status_t value) const throw (SocketException)

6.540.1 Detailed Description

Platform-independent implementation of the socket interface.

6.540.2 Constructor & Destructor Documentation

6.540.2.1 decaf::net::TcpSocket::TcpSocket () throw (SocketException)

Construct a non-connected socket.

Exceptions:

SocketException (p. 2379) thrown on windows if the static initialization call to WSAS-tartup was not successful.

6.540.2.2 decaf::net::TcpSocket::TcpSocket (SocketHandle *socketHandle*)

Construct a connected or bound socket based on given socket handle.

Parameters:

socketHandle a socket handle to wrap in the object

6.540.2.3 virtual decaf::net::TcpSocket::~~TcpSocket () [virtual]

Releases the socket handle but not gracefully shut down the connection.

6.540.3 Member Function Documentation

6.540.3.1 void decaf::net::TcpSocket::checkResult (apr_status_t *value*) const throw (SocketException) [protected]

6.540.3.2 virtual void decaf::net::TcpSocket::close () throw (lang::Exception) [virtual]

Closes this object and deallocates the appropriate resources.

Exceptions:

Exception

Implements **decaf::io::Closeable** (p. 840).

6.540.3.3 virtual void decaf::net::TcpSocket::connect (const char * *host*, int *port*) throw (SocketException) [inline, virtual]

Connects to the specified destination. Closes this socket if connected to another destination.

Parameters:

host The host of the server to connect to.

port The port of the server to connect to.

Exceptions:

SocketException (p. 2379) Thrown if a failure occurred in the connect.

Implements **decaf::net::Socket** (p. 2372).

6.540.3.4 void decaf::net::TcpSocket::connect (const char * *host*, int *port*, int *timeout*) throw (SocketException)

Connects to the specified destination. Closes this socket if connected to another destination.

Parameters:

host The host of the server to connect to.

port The port of the server to connect to.

timeout of socket in microseconds

Exceptions:

SocketException (p. 2379) Thrown if a failure occurred in the connect.

6.540.3.5 virtual io::InputStream* decaf::net::TcpSocket::getInputStream () [virtual]

Gets the InputStream for this socket.

Returns:

The InputStream for this socket. NULL if not connected.

Implements **decaf::net::Socket** (p. 2373).

6.540.3.6 virtual bool decaf::net::TcpSocket::getKeepAlive () const throw (SocketException) [virtual]

Gets the keep alive flag.

Returns:

True if keep alive is enabled.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2373).

6.540.3.7 virtual io::OutputStream* decaf::net::TcpSocket::getOutputStream () [virtual]

Gets the OutputStream for this socket.

Returns:

the OutputStream for this socket. NULL if not connected.

Implements **decaf::net::Socket** (p. 2373).

6.540.3.8 virtual int decaf::net::TcpSocket::getReceiveBufferSize () const throw (SocketException) [virtual]

Gets the receive buffer size.

Returns:

the receive buffer size in bytes.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2373).

6.540.3.9 **virtual bool decaf::net::TcpSocket::getReuseAddress () const throw (SocketException)** [virtual]

Gets the reuse address flag.

Returns:

True if the address can be reused.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2374).

6.540.3.10 **virtual int decaf::net::TcpSocket::getSendBufferSize () const throw (SocketException)** [virtual]

Gets the send buffer size.

Returns:

the size in bytes of the send buffer.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2374).

6.540.3.11 **SocketHandle decaf::net::TcpSocket::getSocketHandle ()** [inline]

Gets the handle for the socket.

Returns:

SocketHabler for this **Socket** (p. 2371), can be NULL

6.540.3.12 **virtual int decaf::net::TcpSocket::getSoLinger () const throw (SocketException)** [virtual]

Gets the linger time.

Returns:

The linger time in seconds.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2374).

6.540.3.13 `virtual int decaf::net::TcpSocket::getSoTimeout () const throw (SocketException)` [virtual]

Gets the timeout for socket operations.

Returns:

The timeout in milliseconds for socket operations.

Exceptions:

SocketException (p. 2379) Thrown if unable to retrieve the information.

Implements **decaf::net::Socket** (p. 2375).

6.540.3.14 `virtual bool decaf::net::TcpSocket::getTcpNoDelay () const throw (lang::Exception)` [virtual]

Gets the Status of the TCP_NODELAY param for this socket as a Bool.

Returns:

true if TCP_NODELAY is enabled

Exceptions:

Exception

6.540.3.15 `virtual bool decaf::net::TcpSocket::isConnected () const` [inline, virtual]

Indicates whether or not this socket is connected to a destination.

Returns:

true if connected

Implements **decaf::net::Socket** (p. 2375).

6.540.3.16 `virtual void decaf::net::TcpSocket::setKeepAlive (bool keepAlive) throw (SocketException)` [virtual]

Enables/disables the keep alive flag.

Parameters:

keepAlive If true, enables the flag.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2375).

6.540.3.17 `virtual void decaf::net::TcpSocket::setReceiveBufferSize (int size) throw (SocketException)` [virtual]

Sets the receive buffer size.

Parameters:

size Number of bytes to set the receive buffer to.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements `decaf::net::Socket` (p. 2375).

6.540.3.18 `virtual void decaf::net::TcpSocket::setReuseAddress (bool reuse) throw (SocketException)` [virtual]

Sets the reuse address flag.

Parameters:

reuse If true, sets the flag.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements `decaf::net::Socket` (p. 2376).

6.540.3.19 `virtual void decaf::net::TcpSocket::setSendBufferSize (int size) throw (SocketException)` [virtual]

Sets the send buffer size.

Parameters:

size The number of bytes to set the send buffer to.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements `decaf::net::Socket` (p. 2376).

6.540.3.20 `virtual void decaf::net::TcpSocket::setSoLinger (int linger) throw (SocketException)` [virtual]

Sets the linger time.

Parameters:

linger The linger time in seconds. If 0, linger is off.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements `decaf::net::Socket` (p. 2376).

6.540.3.21 `virtual void decaf::net::TcpSocket::setSoTimeout (int timeout) throw (SocketException) [virtual]`

Sets the timeout for socket operations.

Parameters:

timeout The timeout in milliseconds for socket operations.

Exceptions:

SocketException (p. 2379) Thrown if unable to set the information.

Implements `decaf::net::Socket` (p. 2377).

6.540.3.22 `virtual void decaf::net::TcpSocket::setTcpNoDelay (bool value) throw (lang::Exception) [virtual]`

Sets the Status of the TCP_NODELAY param for this socket as a Bool.

Parameters:

value - true if TCP_NODELAY is to be enabled

Exceptions:

Exception

- `src/main/decaf/net/TcpSocket.h`

6.541 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based **transport** (p. 67) filter, this **transport** (p. 67) is meant to wrap an instance of an **IOTransport** (p. 1480).

#include <src/main/activemq/transport/tcp/TcpTransport.h> Inheritance diagram for activemq::transport::tcp::TcpTransport:

Public Member Functions

- **TcpTransport** (const **decaf::util::Properties** &properties, const **Pointer**< **Transport** > &next)

Constructor.

- **TcpTransport** (const **decaf::net::URI** &uri, const **decaf::util::Properties** &properties, const **Pointer**< **Transport** > &next)

Constructor.

- virtual ~**TcpTransport** ()
- virtual void **close** () throw (cms::CMSException)

Delegates to the superclass and then closes the socket.

- virtual bool **isFaultTolerant** () const

*Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- virtual bool **isConnected** () const

*Is the **Transport** (p. 2608) Connected to its Broker.*

- virtual bool **isClosed** () const

*Has the **Transport** (p. 2608) been shutdown and no longer usable.*

6.541.1 Detailed Description

Implements a TCP/IP based **transport** (p. 67) filter, this **transport** (p. 67) is meant to wrap an instance of an **IOTransport** (p. 1480). The lower level **transport** (p. 67) should take care of managing stream reads and writes.

6.541.2 Constructor & Destructor Documentation

- #### 6.541.2.1 activemq::transport::tcp::TcpTransport::TcpTransport (const decaf::util::Properties & *properties*, const **Pointer**< **Transport** > & *next*)

Constructor.

Parameters:

properties the configuration properties for this **transport** (p. 67)
next the next **transport** (p. 67) in the chain

6.541.2.2 `activemq::transport::tcp::TcpTransport::TcpTransport (const decaf::net::URI & uri, const decaf::util::Properties & properties, const Pointer< Transport > & next)`

Constructor.

Parameters:

uri - The URI containing the host to connect to.
properties the configuration properties for this **transport** (p. 67)
next the next **transport** (p. 67) in the chain

6.541.2.3 `virtual activemq::transport::tcp::TcpTransport::~~TcpTransport ()`
 [virtual]

6.541.3 Member Function Documentation

6.541.3.1 `virtual void activemq::transport::tcp::TcpTransport::close () throw (cms::CMSException)` [virtual]

Delegates to the superclass and then closes the socket.

Exceptions:

CMSException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 2618).

6.541.3.2 `virtual bool activemq::transport::tcp::TcpTransport::isClosed () const`
 [inline, virtual]

Has the **Transport** (p. 2608) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 2608)

Reimplemented from **activemq::transport::TransportFilter** (p. 2619).

6.541.3.3 `virtual bool activemq::transport::tcp::TcpTransport::isConnected () const`
 [inline, virtual]

Is the **Transport** (p. 2608) Connected to its Broker.

Returns:

true if a connection has been made.

Reimplemented from **activemq::transport::TransportFilter** (p. 2619).

6.541.3.4 `virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant ()` `const [inline, virtual]`

Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 2608) is fault tolerant.

Reimplemented from **activemq::transport::TransportFilter** (p. 2619).

The documentation for this class was generated from the following file:

Factory Responsible for creating the **TcpTransport** (p. 2532).

6.542.2 Constructor & Destructor Documentation

6.542.2.1 virtual
 activemq::transport::tcp::TcpTransportFactory::~~TcpTransportFactory ()
 [inline, virtual]

6.542.3 Member Function Documentation

6.542.3.1 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::create (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException)
 [virtual]

Creates a fully configured **Transport** (p.2608) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.2614).

6.542.3.2 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::createComposite (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException)
 [virtual]

Creates a slimed down **Transport** (p.2608) instance which can be used in composite **transport** (p.67) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.2615).

6.542.3.3 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::doCreateComposite (const decaf::net::URI & *location*, const Pointer< wireformat::WireFormat > & *wireFormat*, const decaf::util::Properties & *properties*) throw (exceptions::ActiveMQException) [protected, virtual]

Creates a slimed down **Transport** (p.2608) instance which can be used in composite **transport** (p.67) instances.

Parameters:

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 2608).

properties - Properties to apply to the **transport** (p. 67).

Returns:

new Pointer to a **TcpTransport** (p. 2532).

Exceptions:

ActiveMQException if an error occurs

The documentation for this class was generated from the following file:

6.543 cms::TemporaryQueue Class Reference

Defines a Temporary **Queue** (p. 2157) based **Destination** (p. 1190).

#include <src/main/cms/TemporaryQueue.h> Inheritance diagram for cms::TemporaryQueue:

Public Member Functions

- virtual **~TemporaryQueue** ()
- virtual std::string **getQueueName** () const =0 throw (CMSEException)
Gets the name of this queue.
- virtual void **destroy** ()=0 throw (CMSEException)
*Destroy's the Temporary **Destination** (p. 1190) at the Provider.*

6.543.1 Detailed Description

Defines a Temporary **Queue** (p. 2157) based **Destination** (p. 1190). A **TemporaryQueue** (p. 2538) is a special type of **Queue** (p. 2157) **Destination** (p. 1190) that can only be consumed from the **Connection** (p. 941) which created it. TemporaryQueues are most commonly used as the reply to address for Message's that implement the request response pattern.

A **TemporaryQueue** (p. 2538) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 941) that created it.

Since:

1.0

6.543.2 Constructor & Destructor Documentation

6.543.2.1 virtual cms::TemporaryQueue::~~TemporaryQueue () [inline, virtual]

6.543.3 Member Function Documentation

6.543.3.1 virtual void cms::TemporaryQueue::destroy () throw (CMSEException)
 [pure virtual]

Destroy's the Temporary **Destination** (p. 1190) at the Provider.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTempQueue** (p. 417).

6.543.3.2 virtual std::string cms::TemporaryQueue::getQueueName () const throw
(CMSEException) [pure virtual]

Gets the name of this queue.

Returns:

The queue name.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTempQueue** (p. 418).

The documentation for this class was generated from the following file:

6.544 cms::TemporaryTopic Class Reference

Defines a Temporary **Topic** (p. 2571) based **Destination** (p. 1190).

#include <src/main/cms/TemporaryTopic.h> Inheritance diagram for cms::TemporaryTopic:

Public Member Functions

- virtual **~TemporaryTopic** ()
- virtual std::string **getTopicName** () const =0 throw (CMSEException)
Gets the name of this topic.
- virtual void **destroy** ()=0 throw (CMSEException)
*Destroy's the Temporary **Destination** (p. 1190) at the Provider.*

6.544.1 Detailed Description

Defines a Temporary **Topic** (p. 2571) based **Destination** (p. 1190). A **TemporaryTopic** (p. 2540) is a special type of **Topic** (p. 2571) **Destination** (p. 1190) that can only be consumed from the **Connection** (p. 941) which created it. TemporaryTopics are most commonly used as the reply to address for Message's that implement the request response pattern.

A **TemporaryTopic** (p. 2540) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 941) that created it.

Since:

1.0

6.544.2 Constructor & Destructor Documentation

6.544.2.1 virtual cms::TemporaryTopic::~~TemporaryTopic () [inline, virtual]

6.544.3 Member Function Documentation

6.544.3.1 virtual void cms::TemporaryTopic::destroy () throw (CMSEException)
[pure virtual]

Destroy's the Temporary **Destination** (p. 1190) at the Provider.

Exceptions:

CMSEException (p. 850)

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 434).

6.544.3.2 `virtual std::string cms::TemporaryTopic::getTopicName () const throw (CMSException) [pure virtual]`

Gets the name of this topic.

Returns:

The topic name.

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 435).

The documentation for this class was generated from the following file:

- `src/main/cms/TemporaryTopic.h`

6.545 cms::TextMessage Class Reference

Interface for a text message.

#include <src/main/cms/TextMessage.h> Inheritance diagram for cms::TextMessage:

Public Member Functions

- virtual `~TextMessage ()`
- virtual `std::string getText () const =0 throw (CMSEException)`
Gets the message character buffer.
- virtual `void setText (const char *msg)=0 throw (CMSEException)`
Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- virtual `void setText (const std::string &msg)=0 throw (CMSEException)`
Sets the message contents.

6.545.1 Detailed Description

Interface for a text message. A **TextMessage** (p. 2542) can contain any Text based pay load such as an XML Document or other Text based document.

Like all Messages, a **TextMessage** (p. 2542) is received in Read-Only mode, any attempt to write to the **Message** (p. 1753) will result in a `MessageNotWritableException` being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

Since:

1.0

6.545.2 Constructor & Destructor Documentation

6.545.2.1 virtual `cms::TextMessage::~~TextMessage ()` [inline, virtual]

6.545.3 Member Function Documentation

6.545.3.1 virtual `std::string cms::TextMessage::getText () const throw (CMSEException)` [pure virtual]

Gets the message character buffer.

Returns:

The message character buffer.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 451).

6.545.3.2 virtual void cms::TextMessage::setText (const std::string & *msg*) throw (CMSException) [pure virtual]

Sets the message contents.

Parameters:

msg The message buffer.

Exceptions:

CMSException (p. 850) - if an internal error occurs.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 451).

6.545.3.3 virtual void cms::TextMessage::setText (const char * *msg*) throw (CMSException) [pure virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters:

msg The message buffer.

Exceptions:

CMSException (p. 850) - if an internal error occurs.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 451).

The documentation for this class was generated from the following file:

- src/main/cms/**TextMessage.h**

6.546 decaf::lang::Thread Class Reference

Basic thread class - mimics the Java **Thread** (p. 2544).

#include <src/main/decaf/lang/Thread.h> Inheritance diagram for decaf::lang::Thread:

Public Member Functions

- **Thread** ()
default Constructor
- **Thread** (**Runnable** *task)
Constructor.
- virtual ~**Thread** ()
- virtual void **start** () throw (Exception)
Creates a system thread and starts it in a joinable mode.
- virtual void **join** () throw (Exception)
Wait til the thread exits.
- virtual void **run** ()
Default implementation of the run method - does nothing.

Static Public Member Functions

- static void **sleep** (int millisecs)
Halts execution of the calling thread for a specified no of millisec.
- static void **yield** ()
Causes the currently executing thread object to temporarily pause and allow other threads to execute.
- static unsigned long **getId** ()
*Obtains the **Thread** (p. 2544) Id of the current thread.*

6.546.1 Detailed Description

Basic thread class - mimics the Java **Thread** (p. 2544). Derived classes may implement the run method, or this class can be used as is with a provided **Runnable** (p. 2256) delegate.

6.546.2 Constructor & Destructor Documentation

6.546.2.1 decaf::lang::Thread::Thread ()

default Constructor

6.546.2.2 decaf::lang::Thread::Thread (Runnable * *task*)

Constructor.

Parameters:

task the **Runnable** (p. 2256) that this thread manages

6.546.2.3 virtual decaf::lang::Thread::~~Thread () [virtual]

6.546.3 Member Function Documentation

6.546.3.1 static unsigned long decaf::lang::Thread::getId () [static]

Obtains the **Thread** (p. 2544) Id of the current thread.

Returns:

Thread (p. 2544) Id

6.546.3.2 virtual void decaf::lang::Thread::join () throw (Exception) [virtual]

Wait til the thread exits. This is when the **run()** (p. 2545) method has returned or has thrown an exception.

6.546.3.3 virtual void decaf::lang::Thread::run () [inline, virtual]

Default implementation of the run method - does nothing.

Implements **decaf::lang::Runnable** (p. 2256).

Reimplemented in **activemq::transport::mock::InternalCommandListener** (p. 1458), and **decaf::util::concurrent::PooledThread** (p. 2033).

6.546.3.4 static void decaf::lang::Thread::sleep (int *milliseconds*) [static]

Halts execution of the calling thread for a specified no of millisec. Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters:

milliseconds time in milliseconds to sleep

6.546.3.5 virtual void decaf::lang::Thread::start () throw (Exception) [virtual]

Creates a system thread and starts it in a joinable mode. Upon creation, the **run()** (p. 2545) method of either this object or the provided **Runnable** (p. 2256) object will be invoked in the context of this thread.

Exceptions:

runtime_error is thrown if the system could not start the thread.

6.546.3.6 `static void decaf::lang::Thread::yield ()` [static]

Causes the currently executing thread object to temporarily pause and allow other threads to execute.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Thread.h`

6.547 decaf::util::concurrent::ThreadFactory Class Reference

public interface **ThreadFactory** (p. 2547)

```
#include <src/main/decaf/util/concurrent/ThreadFactory.h>
```

Public Member Functions

- virtual **~ThreadFactory** ()
- virtual Thread * **newThread** (Runnable *r)=0

Constructs a new Thread.

6.547.1 Detailed Description

public interface **ThreadFactory** (p. 2547) An object that creates new threads on demand. Using thread factories removes hardwiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

```
class SimpleThreadFactory : public ThreadFactory (p. 2547) { public: Thread* newThread(Runnable* r) (p. 2547) { return new Thread(r); } }
```

The Executors.defaultThreadFactory() method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

Since:

1.0

6.547.2 Constructor & Destructor Documentation

6.547.2.1 virtual decaf::util::concurrent::ThreadFactory::~~ThreadFactory ()
[inline, virtual]

6.547.3 Member Function Documentation

6.547.3.1 virtual Thread* decaf::util::concurrent::ThreadFactory::newThread (Runnable * r) [pure virtual]

Constructs a new Thread. Implementations may also initialize priority, name, daemon status, ThreadGroup, etc.

Parameters:

r - a runnable to be executed by new thread instance

Returns:

constructed thread, or null if the request to create a thread is rejected

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/ThreadFactory.h`

6.548 decaf::util::concurrent::ThreadPool Class Reference

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

#include <src/main/decaf/util/concurrent/ThreadPool.h> Inheritance diagram for decaf::util::concurrent::ThreadPool:

Public Types

- typedef std::pair< lang::Runnable *, TaskListener * > Task

Public Member Functions

- **ThreadPool** ()
- virtual **~ThreadPool** ()
- virtual void **queueTask** (Task task) throw (lang::Exception)
Queue (p. 2154) a task to be completed by one of the Pooled Threads.
- virtual **Task deQueueTask** () throw (lang::Exception)
DeQueue a task to be completed by one of the Pooled Threads.
- virtual std::size_t **getPoolSize** () const
Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.
- virtual std::size_t **getBacklog** () const
Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.
- virtual void **reserve** (std::size_t size)
Ensures that there is at least the specified number of Threads allocated to the pool.
- virtual std::size_t **getMaxThreads** () const
Get the Max Number of Threads this Pool can contain.
- virtual void **setMaxThreads** (std::size_t maxThreads)
Sets the Max number of threads this pool can contain.
- virtual std::size_t **getBlockSize** () const
Gets the Max number of threads that can be allocated at a time when new threads are needed.
- virtual void **setBlockSize** (std::size_t blockSize)
Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.
- virtual std::size_t **getFreeThreadCount** () const
Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.

- virtual void **onTaskStarted** (**PooledThread** *thread)

Called by a pooled thread when it is about to begin executing a new task.

- virtual void **onTaskCompleted** (**PooledThread** *thread)

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.

- virtual void **onTaskException** (**PooledThread** *thread, **lang::Exception** &ex)

*Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2032) is now no longer running.*

Static Public Member Functions

- static **ThreadPool** * **getInstance** ()

Return the one and only Thread Pool instance.

Static Public Attributes

- static const size_t **DEFAULT__MAX__POOL__SIZE** = 10
- static const size_t **DEFAULT__MAX__BLOCK__SIZE** = 3

6.548.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks. The Thread Pool has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the **Runnable** interface and one of the worker threads will execute it in its thread context.

6.548.2 Member Typedef Documentation

6.548.2.1 `typedef std::pair<lang::Runnable*, TaskListener*>
decaf::util::concurrent::ThreadPool::Task`

6.548.3 Constructor & Destructor Documentation

6.548.3.1 `decaf::util::concurrent::ThreadPool::ThreadPool ()`

6.548.3.2 `virtual decaf::util::concurrent::ThreadPool::~~ThreadPool ()` [virtual]

6.548.4 Member Function Documentation

6.548.4.1 `virtual Task decaf::util::concurrent::ThreadPool::deQueueTask () throw (
lang::Exception)` [virtual]

DeQueue a task to be completed by one of the Pooled Threads. A caller of this method will block until there is something in the tasks queue, therefore care must be taken when calling this function. Normally clients of **ThreadPool** (p. 2549) don't use this, only the **PooledThread** (p. 2032) objects owned by this **ThreadPool** (p. 2549).

Returns:

object that derives from Runnable

Exceptions:

ActiveMQException

6.548.4.2 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBacklog ()
const` [inline, virtual]

Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.

Returns:

number of outstanding tasks.

6.548.4.3 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBlockSize ()
const` [inline, virtual]

Gets the Max number of threads that can be allocated at a time when new threads are needed.

Returns:

max Thread Block Size

6.548.4.4 `virtual std::size_t de-
caf::util::concurrent::ThreadPool::getFreeThreadCount ()
const` [inline, virtual]

Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable. This value could change immediately after calling as Threads

could finish right after and be available again. This is informational only.

Returns:

total free threads

6.548.4.5 `static ThreadPool* decaf::util::concurrent::ThreadPool::getInstance ()`
[static]

Return the one and only Thread Pool instance.

Returns:

The Thread Pool Pointer

6.548.4.6 `virtual std::size_t decaf::util::concurrent::ThreadPool::getMaxThreads ()`
`const` [inline, virtual]

Get the Max Number of Threads this Pool can contain.

Returns:

max size

6.548.4.7 `virtual std::size_t decaf::util::concurrent::ThreadPool::getPoolSize ()`
`const` [inline, virtual]

Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.

Returns:

integer number of threads in existence.

6.548.4.8 `virtual void decaf::util::concurrent::ThreadPool::onTaskCompleted`
`(PooledThread * thread)` [virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.

Parameters:

thread Pointer the the Pooled Thread that is making this call.

Implements `decaf::util::concurrent::PooledThreadListener` (p. 2035).

6.548.4.9 `virtual void decaf::util::concurrent::ThreadPool::onTaskException`
`(PooledThread * thread, lang::Exception & ex)` [virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the `PooledThread` (p. 2032) is now no longer running.

Parameters:

thread Pointer to the Pooled Thread that is making this call

ex The Exception that occurred.

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2036).

6.548.4.10 virtual void decaf::util::concurrent::ThreadPool::onTaskStarted (PooledThread * *thread*) [virtual]

Called by a pooled thread when it is about to begin executing a new task. This will decrement the available threads counter so that this object knows when there are no more free threads and must create new ones.

Parameters:

thread Pointer to the Pooled Thread that is making this call

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2036).

6.548.4.11 virtual void decaf::util::concurrent::ThreadPool::queueTask (Task *task*) throw (lang::Exception) [virtual]

Queue (p. 2154) a task to be completed by one of the Pooled Threads. tasks are serviced as soon as a PooledThread (p. 2032) is available to run it.

Parameters:

task object that derives from Runnable

Exceptions:

ActiveMQException

6.548.4.12 virtual void decaf::util::concurrent::ThreadPool::reserve (std::size_t *size*) [virtual]

Ensures that there is at least the specified number of Threads allocated to the pool. If the size is greater than the MAX number of threads in the pool, then only MAX threads are reserved. If the size is smaller than the number of threads currently in the pool, than nothing is done.

Parameters:

size the number of threads to reserve.

6.548.4.13 virtual void decaf::util::concurrent::ThreadPool::setBlockSize (std::size_t *blockSize*) [virtual]

Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.

Parameters:

blockSize Max Thread Block Size

6.548.4.14 `virtual void decaf::util::concurrent::ThreadPool::setMaxThreads`
`(std::size_t maxThreads)` [virtual]

Sets the Max number of threads this pool can contain. if this value is smaller than the current size of the pool nothing is done.

Parameters:

maxThreads total number of threads that can be pooled

6.548.5 Field Documentation

6.548.5.1 `const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_BLOCK_SIZE = 3` [static]

6.548.5.2 `const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_POOL_SIZE = 10` [static]

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/ThreadPool.h`

6.549 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

#include <src/main/decaf/lang/Throwable.h> Inheritance diagram for decaf::lang::Throwable:

Public Member Functions

- **Throwable** () throw ()
- virtual ~**Throwable** () throw ()
- virtual std::string **getMessage** () const =0
Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.
- virtual const std::exception * **getCause** () const =0
*Gets the exception that caused this one to be thrown, this allows for chaining of **exceptions** (p. 104) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.*
- virtual void **initCause** (const std::exception *cause)=0
Initializes the contained cause exception with the one given.
- virtual void **setMark** (const char *file, const int lineNumber)=0
Adds a file/line number to the stack trace.
- virtual **Throwable** * **clone** () const =0
Clones this exception.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const =0
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **printStackTrace** () const =0
Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) const =0
Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () const =0
Gets the stack trace as one contiguous string.

6.549.1 Detailed Description

This class represents an error that has occurred. All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 1268) class in order to ensure that all Decaf Exceptions are interchangeable with the std::exception class.

Throwable (p. 2555) can wrap another **Throwable** (p. 2555) as the cause if the error being thrown. The user can inspect the cause by calling `getCause`, the pointer returned is the property of the **Throwable** (p. 2555) instance and will be deleted when it is deleted or goes out of scope.

Since:

1.0

6.549.2 Constructor & Destructor Documentation

6.549.2.1 `decaf::lang::Throwable::Throwable () throw () [inline]`

6.549.2.2 `virtual decaf::lang::Throwable::~~Throwable () throw () [inline, virtual]`

6.549.3 Member Function Documentation

6.549.3.1 `virtual Throwable* decaf::lang::Throwable::clone () const [pure virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this **Exception** (p. 1268) object

Implemented in `activemq::exceptions::ActiveMQException` (p. 253), `activemq::exceptions::BrokerException` (p. 590), `decaf::io::EOFException` (p. 1267), `decaf::io::InterruptedIOException` (p. 1464), `decaf::io::IOException` (p. 1479), `decaf::io::UTFDataFormatException` (p. 2685), `decaf::lang::Exception` (p. 1271), `decaf::lang::exceptions::ClassCastException` (p. 837), `decaf::lang::exceptions::IllegalArgumentException` (p. 1395), `decaf::lang::exceptions::IllegalMonitorStateException` (p. 1398), `decaf::lang::exceptions::IllegalStateException` (p. 1402), `decaf::lang::exceptions::IndexOutOfBoundsException` (p. 1405), `decaf::lang::exceptions::InterruptedException` (p. 1461), `decaf::lang::exceptions::InvalidStateException` (p. 1476), `decaf::lang::exceptions::NoSuchElementException` (p. 1947), `decaf::lang::exceptions::NullPointerException` (p. 1953), `decaf::lang::exceptions::NumberFormatException` (p. 1959), `decaf::lang::exceptions::RuntimeException` (p. 2261), `decaf::lang::exceptions::UnsupportedOperationException` (p. 2637), `decaf::net::BindException` (p. 565), `decaf::net::ConnectException` (p. 940), `decaf::net::HttpRetryException` (p. 1392), `decaf::net::MalformedURLException` (p. 1688), `decaf::net::NoRouteToHostException` (p. 1941), `decaf::net::PortUnreachableException` (p. 2039), `decaf::net::ProtocolException` (p. 2152), `decaf::net::SocketException` (p. 2380), `decaf::net::SocketTimeoutException` (p. 2397), `decaf::net::UnknownHostException` (p. 2631), `decaf::net::UnknownServiceException` (p. 2634), `decaf::net::URISyntaxException` (p. 2667), `decaf::nio::BufferOverflowException` (p. 660), `decaf::nio::BufferUnderflowException` (p. 663), `decaf::nio::InvalidMarkException` (p. 1472), `decaf::nio::ReadOnlyBufferException` (p. 2169), `decaf::util::concurrent::BrokenBarrierException` (p. 585), `decaf::util::concurrent::CancellationException` (p. 786), `decaf::util::concurrent::ExecutionException` (p. 1293),

cafe::util::concurrent::RejectedExecutionException (p. 2176), and **decaf::util::concurrent::TimeoutException** (p. 2561).

6.549.3.2 virtual const std::exception* decaf::lang::Throwable::getCause () const
[pure virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of **exceptions** (p. 104) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 1272).

6.549.3.3 virtual std::string decaf::lang::Throwable::getMessage () const [pure virtual]

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.

Returns:

string errors message

Implemented in **decaf::lang::Exception** (p. 1272).

6.549.3.4 virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace () const [pure virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns:

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 1272).

6.549.3.5 virtual std::string decaf::lang::Throwable::getStackTraceString () const
[pure virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 1272).

6.549.3.6 `virtual void decaf::lang::Throwable::initCause (const std::exception *
cause)` [pure virtual]

Initializes the contained cause exception with the one given. A copy is made to avoid ownership issues.

Parameters:

cause The exception that was the cause of this one.

Implemented in `decaf::lang::Exception` (p. 1272).

6.549.3.7 `virtual void decaf::lang::Throwable::printStackTrace (std::ostream &
stream) const` [pure virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

Implemented in `decaf::lang::Exception` (p. 1273).

6.549.3.8 `virtual void decaf::lang::Throwable::printStackTrace () const` [pure virtual]

Prints the stack trace to std::err.

Implemented in `decaf::lang::Exception` (p. 1273).

6.549.3.9 `virtual void decaf::lang::Throwable::setMark (const char * file, const int
lineNumber)` [pure virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use `__FILE__`).

lineNumber The line number in the calling file (use `__LINE__`).

Implemented in `decaf::lang::Exception` (p. 1273).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Throwable.h`

6.550 decaf::util::concurrent::TimeoutException Class Reference

#include <src/main/decaf/util/concurrent/TimeoutException.h> Inheritance diagram for decaf::util::concurrent::TimeoutException:

Public Member Functions

- **TimeoutException** () throw ()
Default Constructor.
- **TimeoutException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **TimeoutException** (const **TimeoutException** &ex) throw ()
Copy Constructor.
- **TimeoutException** (const std::exception *cause) throw ()
Constructor.
- **TimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **TimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **TimeoutException * clone** () const
Clones this exception.
- virtual ~**TimeoutException** () throw ()

6.550.1 Constructor & Destructor Documentation

6.550.1.1 decaf::util::concurrent::TimeoutException::TimeoutException () throw () [inline]

Default Constructor.

6.550.1.2 decaf::util::concurrent::TimeoutException::TimeoutException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.550.1.3 `decaf::util::concurrent::TimeoutException::TimeoutException (const TimeoutException & ex) throw ()` [inline]

Copy Constructor.

Parameters:

ex The exception to copy from.

References `decaf::lang::Exception::Exception()`.

6.550.1.4 `decaf::util::concurrent::TimeoutException::TimeoutException (const std::exception * cause) throw ()` [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.550.1.5 `decaf::util::concurrent::TimeoutException::TimeoutException (const char * file, const int lineNumber, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The string message to report

... list of primitives that are formatted into the message

6.550.1.6 `decaf::util::concurrent::TimeoutException::TimeoutException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The string message to report

... list of primitives that are formatted into the message

6.550.1.7 virtual decaf::util::concurrent::TimeoutException::~~TimeoutException ()
throw () [inline, virtual]

6.550.2 Member Function Documentation

6.550.2.1 virtual TimeoutException* decaf::util::concurrent::TimeoutException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new **TimeoutException** (p.2559) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p.1271).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**TimeoutException.h**

6.551 decaf::util::concurrent::TimeUnit Class Reference

A **TimeUnit** (p. 2562) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.

6.551.1 Detailed Description

A **TimeUnit** (p. 2562) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units. A **TimeUnit** (p. 2562) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 2562) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following code will timeout in 50 milliseconds if the lock is not available:

```
Lock (p. 1616) lock = ...; if ( lock.tryLock( 50, TimeUnit.MILLISECONDS (p. 2570) ) ) ...
```

while this code will timeout in 50 seconds:

Lock (p. 1616) `lock = ...; if (lock.tryLock(50, TimeUnit.SECONDS (p. 2570))) ...`

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 2562).

6.551.2 Constructor & Destructor Documentation

6.551.2.1 `decaf::util::concurrent::TimeUnit::TimeUnit (int index, const std::string & name)` [protected]

Hidden Constructor, this class can not be instantiated directly.

Parameters:

index - Index into the Time Unit set.

name - Name of the unit type being represented.

6.551.2.2 `virtual decaf::util::concurrent::TimeUnit::~~TimeUnit ()` [inline, virtual]

6.551.3 Member Function Documentation

6.551.3.1 `virtual int decaf::util::concurrent::TimeUnit::compareTo (const TimeUnit & value) const` [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all x and y. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementer must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all z.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the Comparable interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.551.3.2 long long decaf::util::concurrent::TimeUnit::convert (long long *sourceDuration*, const TimeUnit & *sourceUnit*) const

Convert the given time duration in the given unit to this unit. Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to Long.MIN_VALUE if negative or Long.MAX_VALUE if positive.

For example, to convert 10 minutes to milliseconds, use: TimeUnit.MILLISECONDS.convert(10L, TimeUnit.MINUTES (p. 2570))

Parameters:

sourceDuration - Duration value to convert.

sourceUnit - Unit type of the source duration.

Returns:

the converted duration in this unit, or Long.MIN_VALUE if conversion would negatively overflow, or Long.MAX_VALUE if it would positively overflow.

6.551.3.3 virtual bool decaf::util::concurrent::TimeUnit::equals (const TimeUnit & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.551.3.4 virtual bool decaf::util::concurrent::TimeUnit::operator< (const TimeUnit & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.551.3.5 virtual bool decaf::util::concurrent::TimeUnit::operator== (const TimeUnit & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.551.3.6 void decaf::util::concurrent::TimeUnit::sleep (long long *timeout*) const

Perform a timed `Thread.join` using this time unit. This is a convenience method that converts time arguments into the form required by the `Thread.join` method.

Parameters:

thread the thread to wait for

timeout the maximum time to wait

Exceptions:

InterruptedException if interrupted while waiting.

See also:

`Thread::join(long, int)` Perform a `Thread.sleep` using this unit. This is a convenience method that converts time arguments into the form required by the `Thread.sleep` method.

Parameters:

timeout the minimum time to sleep

See also:

`Thread::sleep`

6.551.3.7 void decaf::util::concurrent::TimeUnit::timedWait (Synchronizable * *obj*, long long *timeout*) const

Perform a timed `Object.wait` using this time unit. This is a convenience method that converts timeout arguments into the form required by the `Object.wait` method.

For example, you could implement a blocking poll method (see `BlockingQueue.poll (p. ??)`) using:

```
public synchronized Object poll(long timeout, TimeUnit unit) throws InterruptedException {
    while (empty) {
        unit.timedWait(this, timeout);
        ...
    }
}
```

Parameters:

obj the object to wait on

timeout the maximum time to wait.

Exceptions:

InterruptedException if interrupted while waiting.

See also:

`Synchronizable::wait(long, int)`

6.551.3.8 long long decaf::util::concurrent::TimeUnit::toDays (long long *duration*) const [inline]

Equivalent to DAYS.convert(duration, this).

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 2565)

6.551.3.9 long long decaf::util::concurrent::TimeUnit::toHours (long long *duration*) const [inline]

Equivalent to HOURS.convert(duration, this).

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 2565)

6.551.3.10 long long decaf::util::concurrent::TimeUnit::toMicros (long long *duration*) const [inline]

Equivalent to MICROSECONDS.convert(duration, this).

Parameters:

duration the duration

Returns:

the converted duration, or Long.MIN_VALUE if conversion would negatively overflow, or Long.MAX_VALUE if it would positively overflow.

See also:

convert (p. 2565)

6.551.3.11 `long long decaf::util::concurrent::TimeUnit::toMillis (long long duration) const [inline]`

Equivalent to `MILLISECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

`convert` (p. 2565)

6.551.3.12 `long long decaf::util::concurrent::TimeUnit::toMinutes (long long duration) const [inline]`

Equivalent to `MINUTES.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

`convert` (p. 2565)

6.551.3.13 `long long decaf::util::concurrent::TimeUnit::toNanos (long long duration) const [inline]`

Equivalent to `NANOSECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

`convert` (p. 2565)

6.551.3.14 `long long decaf::util::concurrent::TimeUnit::toSeconds (long long duration) const [inline]`

Equivalent to `SECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

`convert` (p. 2565)

6.551.3.15 `virtual std::string decaf::util::concurrent::TimeUnit::toString () const [virtual]`

Converts the **TimeUnit** (p. 2562) type to the Name of the **TimeUnit** (p. 2562).

Returns:

String name of the **TimeUnit** (p. 2562)

6.551.3.16 `static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf (const std::string & name) throw (decaf::lang::exceptions::IllegalArgumentException) [static]`

Returns the **TimeUnit** (p. 2562) constant of this type with the specified name. The string must match exactly an identifier used to declare an **TimeUnit** (p. 2562) constant in this type. (Extraaneous whitespace characters are not permitted.)

Parameters:

name The Name of the **TimeUnit** (p. 2562) constant to be returned.

Returns:

A constant reference to the **TimeUnit** (p. 2562) Constant with the given name.

Exceptions:

IllegalArgumentException if this enum type has no constant with the specified name

6.554.1 Member Typedef Documentation

6.554.1.1 typedef decaf::lang::PointerComparator<TransactionId>
activemq::commands::TransactionId::COMPARATOR

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1601), and **activemq::commands::XATransactionId** (p. 2732).

6.554.2 Constructor & Destructor Documentation

6.554.2.1 `activemq::commands::TransactionId::TransactionId ()`

6.554.2.2 `activemq::commands::TransactionId::TransactionId (const TransactionId & other)`

6.554.2.3 `virtual activemq::commands::TransactionId::~~TransactionId ()` [virtual]

6.554.3 Member Function Documentation

6.554.3.1 `virtual TransactionId* activemq::commands::TransactionId::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

Reimplemented in `activemq::commands::LocalTransactionId` (p. 1601), and `activemq::commands::XATransactionId` (p. 2732).

6.554.3.2 `virtual int activemq::commands::TransactionId::compareTo (const TransactionId & value) const` [virtual]

Reimplemented in `activemq::commands::LocalTransactionId` (p. 1601), and `activemq::commands::XATransactionId` (p. 2732).

6.554.3.3 `virtual void activemq::commands::TransactionId::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented in `activemq::commands::LocalTransactionId` (p. 1601), and `activemq::commands::XATransactionId` (p. 2732).

6.554.3.4 `virtual bool activemq::commands::TransactionId::equals (const TransactionId & value) const` [virtual]

Reimplemented in `activemq::commands::LocalTransactionId` (p. 1602), and `activemq::commands::XATransactionId` (p. 2733).

6.554.3.5 virtual bool activemq::commands::TransactionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1602), and **activemq::commands::XATransactionId** (p. 2733).

6.554.3.6 virtual unsigned char activemq::commands::TransactionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1602), and **activemq::commands::XATransactionId** (p. 2733).

6.554.3.7 virtual bool activemq::commands::TransactionId::operator< (const TransactionId & *value*) const [virtual]

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1602), and **activemq::commands::XATransactionId** (p. 2734).

6.554.3.8 TransactionId& activemq::commands::TransactionId::operator= (const TransactionId & *other*)

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1602), and **activemq::commands::XATransactionId** (p. 2734).

6.554.3.9 virtual bool activemq::commands::TransactionId::operator== (const TransactionId & *value*) const [virtual]

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1603), and **activemq::commands::XATransactionId** (p. 2734).

6.554.3.10 virtual std::string activemq::commands::TransactionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 560).

Reimplemented in `activemq::commands::LocalTransactionId` (p. 1603), and `activemq::commands::XATransactionId` (p. 2734).

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 2577). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.555.2 Constructor & Destructor Documentation

6.555.2.1 `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::TransactionIdMarshaller()` [inline]

6.555.2.2 `virtual activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::~~TransactionIdMarshaller()` [inline, virtual]

6.555.3 Member Function Documentation

6.555.3.1 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1613), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 2737).

6.555.3.2 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the `unmarshal`.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 1614), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 2738).

6.555.3.3 `virtual int activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 1614), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 2738).

6.555.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1166).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1615), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 2739).

6.555.3.5 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1169).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1615), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 2739).

The documentation for this class was generated from the following file:

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.556.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 2581). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.556.2 Constructor & Destructor Documentation

6.556.2.1 `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::TransactionIdMarshaller()` [inline]

6.556.2.2 `virtual activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::~~TransactionIdMarshaller()` [inline, virtual]

6.556.3 Member Function Documentation

6.556.3.1 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller` (p. 1609), and `activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller` (p. 2741).

6.556.3.2 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 1610), and **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 2742).

6.556.3.3 `virtual int activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 1610), and **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 2742).

6.556.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1166).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller` (p. 1611), and `activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller` (p. 2743).

6.556.3.5 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1169).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller` (p. 1611), and `activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller` (p. 2743).

The documentation for this class was generated from the following file:

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.557.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 2585). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.557.2 Constructor & Destructor Documentation

6.557.2.1 `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::TransactionIdMarshaller()` [inline]

6.557.2.2 `virtual activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::~~TransactionIdMarshaller()` [inline, virtual]

6.557.3 Member Function Documentation

6.557.3.1 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 1605), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 2745).

6.557.3.2 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the `unmarshal`.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1606), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 2746).

6.557.3.3 `virtual int activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1606), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 2746).

6.557.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1166).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 1607), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 2747).

```
6.557.3.5  virtual void ac-
            tivemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightUnmarshal
            (OpenWireFormat * wireFormat,  commands::DataStructure
            * dataStructure,  decaf::io::DataInputStream * dataIn,
            utils::BooleanStream * bs) throw ( decaf::io::IOException )  [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1169).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 1607), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 2747).

6.558.1 Constructor & Destructor Documentation

6.558.1.1 `activemq::commands::TransactionInfo::TransactionInfo (const TransactionInfo &) [inline, protected]`

6.558.1.2 `activemq::commands::TransactionInfo::TransactionInfo ()`

6.558.1.3 `virtual activemq::commands::TransactionInfo::~~TransactionInfo () [virtual]`

6.558.2 Member Function Documentation

6.558.2.1 `virtual TransactionInfo* activemq::commands::TransactionInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.558.2.2 `virtual void activemq::commands::TransactionInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.558.2.3 `virtual bool activemq::commands::TransactionInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

- 6.558.2.4 `virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId ()`
[virtual]
- 6.558.2.5 `virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId ()`
const [virtual]
- 6.558.2.6 `virtual unsigned char activemq::commands::TransactionInfo::getDataSetType () const`
[virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

- 6.558.2.7 `virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId ()`
[virtual]
- 6.558.2.8 `virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId ()`
const [virtual]
- 6.558.2.9 `virtual unsigned char activemq::commands::TransactionInfo::getType ()`
const [virtual]
- 6.558.2.10 `virtual bool activemq::commands::TransactionInfo::isTransactionInfo ()`
const [inline, virtual]

Returns:

an answer of true to the **isTransactionInfo()** (p. 2591) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

- 6.558.2.11 `TransactionInfo& activemq::commands::TransactionInfo::operator=`
(const TransactionInfo &) [inline, protected]
- 6.558.2.12 `virtual void activemq::commands::TransactionInfo::setConnectionId`
(const Pointer< ConnectionId > & *connectionId*) [virtual]
- 6.558.2.13 `virtual void activemq::commands::TransactionInfo::setTransactionId`
(const Pointer< TransactionId > & *transactionId*) [virtual]
- 6.558.2.14 `virtual void activemq::commands::TransactionInfo::setType` (unsigned
char *type*) [virtual]
- 6.558.2.15 `virtual std::string activemq::commands::TransactionInfo::toString` ()
const [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p.512).

- 6.558.2.16 `virtual Pointer<Command> activemq::commands::TransactionInfo::visit`
(activemq::state::CommandVisitor * *visitor*) throw (
exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p.2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p.883).

6.558.3 Field Documentation

Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.559.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 2594). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.559.2 Constructor & Destructor Documentation

6.559.2.1 `activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::TransactionInfoMarshaller()` `[inline]`

6.559.2.2 `virtual activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` `[inline, virtual]`

6.559.3 Member Function Documentation

6.559.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.559.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.559.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.559.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.559.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.559.3.6 virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.559.3.7 virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.560.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 2598). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.560.2 Constructor & Destructor Documentation

6.560.2.1 `activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::TransactionInfoMarshaller()` `[inline]`

6.560.2.2 `virtual activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` `[inline, virtual]`

6.560.3 Member Function Documentation

6.560.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.560.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.560.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.560.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.560.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.560.3.6 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.560.3.7 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.561.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 2602). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.561.2 Constructor & Destructor Documentation

6.561.2.1 `activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.561.2.2 `virtual activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.561.3 Member Function Documentation

6.561.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.561.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.561.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.561.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.561.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.561.3.6 virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.561.3.7 virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

reconnect to another location

6.563.1 Detailed Description

Interface for a **transport** (p. 67) layer for command objects. Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 2608) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 2608) layer runs. Transports should be given an instance of a WireFormat object when created so that they can turn the built in Commands to / from the required wire format encoding.

6.563.2 Constructor & Destructor Documentation

6.563.2.1 virtual `activemq::transport::Transport::~~Transport ()` [inline, virtual]

6.563.3 Member Function Documentation

6.563.3.1 virtual `std::string activemq::transport::Transport::getRemoteAddress ()`
`const` [pure virtual]

Returns:

the remote address for this connection

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1300), `activemq::transport::IOTransport` (p. 1482), `activemq::transport::mock::MockTransport` (p. 1913), and `activemq::transport::TransportFilter` (p. 2619).

6.563.3.2 virtual `TransportListener* activemq::transport::Transport::getTransportListener ()`
`const` [pure virtual]

Gets the observer of asynchronous events from this **transport** (p. 67).

Returns:

the listener of **transport** (p. 67) events.

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1300), `activemq::transport::IOTransport` (p. 1482), `activemq::transport::mock::MockTransport` (p. 1913), and `activemq::transport::TransportFilter` (p. 2619).

6.563.3.3 virtual `bool activemq::transport::Transport::isClosed ()` `const` [pure virtual]

Has the **Transport** (p. 2608) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 2608)

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1301), `activemq::transport::IOTransport` (p. 1482), `activemq::transport::mock::MockTransport` (p. 1913), `activemq::transport::tcp::TcpTransport` (p. 2533), and `activemq::transport::TransportFilter` (p. 2619).

6.563.3.4 virtual bool activemq::transport::Transport::isConnected () const [pure virtual]

Is the **Transport** (p. 2608) Connected to its Broker.

Returns:

true if a connection has been made.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1301), **activemq::transport::IOTransport** (p. 1483), **activemq::transport::mock::MockTransport** (p. 1914), **activemq::transport::tcp::TcpTransport** (p. 2533), and **activemq::transport::TransportFilter** (p. 2619).

6.563.3.5 virtual bool activemq::transport::Transport::isFaultTolerant () const [pure virtual]

Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 2608) is fault tolerant.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1301), **activemq::transport::IOTransport** (p. 1483), **activemq::transport::mock::MockTransport** (p. 1914), **activemq::transport::tcp::TcpTransport** (p. 2534), and **activemq::transport::TransportFilter** (p. 2619).

6.563.3.6 virtual Transport* activemq::transport::Transport::narrow (const std::type_info & *typeId*) [pure virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2608) to allow a higher level **transport** (p. 67) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1302), **activemq::transport::IOTransport** (p. 1483), **activemq::transport::mock::MockTransport** (p. 1914), and **activemq::transport::TransportFilter** (p. 2620).

Referenced by **activemq::transport::TransportFilter::narrow()**, and **activemq::transport::failover::FailoverTransport::narrow()**.

6.563.3.7 virtual void activemq::transport::Transport::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2238), **activemq::transport::failover::FailoverTransport** (p. 1303), **activemq::transport::IOTransport** (p. 1483), **activemq::transport::logging::LoggingTransport** (p. 1638), **activemq::transport::mock::MockTransport** (p. 1914), **activemq::transport::TransportFilter** (p. 2620), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1985).

6.563.3.8 virtual void **activemq::transport::Transport::reconnect** (const **decaf::net::URI** & *uri*) throw (**decaf::io::IOException**) [pure virtual]

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1303), and **activemq::transport::TransportFilter** (p. 2621).

6.563.3.9 virtual **Pointer<Response>** **activemq::transport::Transport::request** (const **Pointer< Command >** & *command*, unsigned int *timeout*) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**) [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command - The command to be sent.

timeout - The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implemented in `activemq::transport::correlator::ResponseCorrelator` (p. 2239), `activemq::transport::failover::FailoverTransport` (p. 1304), `activemq::transport::IOTransport` (p. 1484), `activemq::transport::logging::LoggingTransport` (p. 1638), `activemq::transport::mock::MockTransport` (p. 1915), `activemq::transport::TransportFilter` (p. 2621), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 1986).

6.563.3.10 `virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)` [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this `transport` (p. 67).

Implemented in `activemq::transport::correlator::ResponseCorrelator` (p. 2239), `activemq::transport::failover::FailoverTransport` (p. 1304), `activemq::transport::IOTransport` (p. 1484), `activemq::transport::logging::LoggingTransport` (p. 1639), `activemq::transport::mock::MockTransport` (p. 1915), `activemq::transport::TransportFilter` (p. 2622), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 1986).

6.563.3.11 `virtual void activemq::transport::Transport::setTransportListener (TransportListener * listener)` [pure virtual]

Sets the observer of asynchronous events from this `transport` (p. 67).

Parameters:

listener the listener of `transport` (p. 67) events.

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1306), `activemq::transport::IOTransport` (p. 1485), `activemq::transport::mock::MockTransport` (p. 1917), and `activemq::transport::TransportFilter` (p. 2622).

6.563.3.12 `virtual void activemq::transport::Transport::setWireFormat (const Pointer< wireformat::WireFormat > & wireFormat)` [pure virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 59).

Implemented in **activemq::transport::IOTransport** (p. 1485), and **activemq::transport::TransportFilter** (p. 2622).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**Transport.h**

6.564 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

#include <src/main/activemq/transport/TransportFactory.h> Inheritance diagram for activemq::transport::TransportFactory:

Public Member Functions

- virtual **~TransportFactory** ()
- virtual **Pointer< Transport > create** (const **decaf::net::URI** &location)=0 throw (exceptions::ActiveMQException)
*Creates a fully configured **Transport** (p. 2608) instance which could be a chain of filters and transports.*
- virtual **Pointer< Transport > createComposite** (const **decaf::net::URI** &location)=0 throw (exceptions::ActiveMQException)
*Creates a slimed down **Transport** (p. 2608) instance which can be used in composite **transport** (p. 67) instances.*

6.564.1 Detailed Description

Defines the interface for Factories that create Transports or TransportFilters. The factory should be able to create either a completely configured **Transport** (p. 2608) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimed down version that is used in composite transports like Failover or Fanout.

Since:

3.0

6.564.2 Constructor & Destructor Documentation

- 6.564.2.1 **virtual activemq::transport::TransportFactory::~~TransportFactory** ()
 [inline, virtual]

6.564.3 Member Function Documentation

- 6.564.3.1 **virtual Pointer<Transport> activemq::transport::TransportFactory::create** (const **decaf::net::URI** & *location*) throw (exceptions::ActiveMQException)
 [pure virtual]

Creates a fully configured **Transport** (p. 2608) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1309), **activemq::transport::mock::MockTransportFactory** (p. 1919), and **activemq::transport::tcp::TcpTransportFactory** (p. 2536).

6.564.3.2 `virtual Pointer<Transport> activemq::transport::TransportFactory::createComposite (const decaf::net::URI & location) throw (exceptions::ActiveMQException)`
[pure virtual]

Creates a slimmed down **Transport** (p. 2608) instance which can be used in composite **transport** (p. 67) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1309), **activemq::transport::mock::MockTransportFactory** (p. 1919), and **activemq::transport::tcp::TcpTransportFactory** (p. 2536).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportFactory.h`

6.565 activemq::transport::TransportFilter Class Reference

A filter on the **transport** (p. 67) layer.

#include <src/main/activemq/transport/TransportFilter.h> Inheritance diagram for activemq::transport::TransportFilter:

Public Member Functions

- **TransportFilter** (const **Pointer**< **Transport** > &next)
Constructor.
- virtual ~**TransportFilter** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex)
*Event handler for an exception from a command **transport** (p. 67).*
- virtual void **transportInterrupted** ()
*The **transport** (p. 67) has suffered an interruption from which it hopes to recover.*
- virtual void **transportResumed** ()
*The **transport** (p. 67) has resumed after an interruption.*
- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Not supported by this class - throws an exception.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Not supported by this class - throws an exception.
- virtual void **setTransportListener** (**TransportListener** *listener)
*Sets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).*
- virtual **TransportListener** * **getTransportListener** () const
*Gets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).*
- virtual void **setWireFormat** (const **Pointer**< **wireformat::WireFormat** > &wireFormat)
*Sets the **WireFormat** instance to use.*
- virtual void **start** () throw (**cms::CMSEException**)

Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59).

- virtual void **close** () throw (cms::CMSException)
Stops the polling thread and closes the streams.
- virtual **Transport * narrow** (const std::type_info &typeId)
Narrows down a Chain of Transports to a specific **Transport** (p. 2608) to allow a higher level **transport** (p. 67) to skip intermediate Transports in certain circumstances.
- virtual bool **isFaultTolerant** () const
Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.
- virtual bool **isConnected** () const
Is the **Transport** (p. 2608) Connected to its Broker.
- virtual bool **isClosed** () const
Has the **Transport** (p. 2608) been shutdown and no longer usable.
- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const decaf::net::URI &uri) throw (decaf::io::IOException)
reconnect to another location

Protected Member Functions

- void **fire** (const decaf::lang::Exception &ex)
Notify the exception listener.
- void **fire** (const Pointer< Command > &command)
Notify the command listener.

Protected Attributes

- Pointer< Transport > **next**
The **transport** (p. 67) that this filter wraps around.
- TransportListener * **listener**
Listener of this **transport** (p. 67).

6.565.1 Detailed Description

A filter on the **transport** (p. 67) layer. **Transport** (p. 2608) filters implement the **Transport** (p. 2608) interface and optionally delegate calls to another **Transport** (p. 2608) object.

6.565.2 Constructor & Destructor Documentation

6.565.2.1 `activemq::transport::TransportFilter::TransportFilter (const Pointer< Transport > & next)`

Constructor.

Parameters:

next - the next **Transport** (p. 2608) in the chain

6.565.2.2 `virtual activemq::transport::TransportFilter::~~TransportFilter ()` [inline, virtual]

6.565.3 Member Function Documentation

6.565.3.1 `virtual void activemq::transport::TransportFilter::close () throw (cms::CMSException)` [inline, virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

CMSException if errors occur.

Implements **cms::Closeable** (p. 838).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2238), **activemq::transport::tcp::TcpTransport** (p. 2533), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1985).

6.565.3.2 `void activemq::transport::TransportFilter::fire (const Pointer< Command > & command)` [inline, protected]

Notify the command listener.

Parameters:

command - the command to send to the listener

6.565.3.3 `void activemq::transport::TransportFilter::fire (const decaf::lang::Exception & ex)` [inline, protected]

Notify the exception listener.

Parameters:

ex - the exception to send to listeners

6.565.3.4 `virtual std::string activemq::transport::TransportFilter::getRemoteAddress () const [inline, virtual]`

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 2609).

6.565.3.5 `virtual TransportListener* activemq::transport::TransportFilter::getTransportListener () const [inline, virtual]`

Gets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).

Returns:

The listener of **transport** (p. 67) events.

Implements **activemq::transport::Transport** (p. 2609).

6.565.3.6 `virtual bool activemq::transport::TransportFilter::isClosed () const [inline, virtual]`

Has the **Transport** (p. 2608) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 2608)

Implements **activemq::transport::Transport** (p. 2609).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2533).

6.565.3.7 `virtual bool activemq::transport::TransportFilter::isConnected () const [inline, virtual]`

Is the **Transport** (p. 2608) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2610).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2533).

6.565.3.8 `virtual bool activemq::transport::TransportFilter::isFaultTolerant () const [inline, virtual]`

Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 2608) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2610).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2534).

6.565.3.9 `virtual Transport* activemq::transport::TransportFilter::narrow (const std::type_info & typeId)` [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2608) to allow a higher level **transport** (p. 67) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2610).

References **activemq::transport::Transport::narrow()**.

6.565.3.10 `virtual void activemq::transport::TransportFilter::onCommand (const Pointer< Command > & command)` [inline, virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Implements **activemq::transport::TransportListener** (p. 2624).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2238), **activemq::transport::logging::LoggingTransport** (p. 1638), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1985).

6.565.3.11 `virtual void activemq::transport::TransportFilter::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)` [inline, virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2610).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2238), **activemq::transport::logging::LoggingTransport** (p. 1638), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1985).

6.565.3.12 **virtual void activemq::transport::TransportFilter::onException (const decaf::lang::Exception & *ex*) [virtual]**

Event handler for an exception from a command **transport** (p. 67).

Parameters:

ex The exception to handle.

Implements **activemq::transport::TransportListener** (p. 2625).

6.565.3.13 **virtual void activemq::transport::TransportFilter::reconnect (const decaf::net::URI & *uri*) throw (decaf::io::IOException) [virtual]**

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

Implements **activemq::transport::Transport** (p. 2611).

6.565.3.14 **virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]**

Not supported by this class - throws an exception.

Parameters:

command - The command that is sent as a request

timeout - The the time to wait for a response.

Exceptions:

IOException

UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 2611).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2239), **activemq::transport::logging::LoggingTransport** (p. 1638), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1986).

6.565.3.15 `virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Not supported by this class - throws an exception.

Parameters:

command the command that is sent as a request

Exceptions:

IOException

UnsupportedOperationException.

Implements `activemq::transport::Transport` (p. 2612).

Reimplemented in `activemq::transport::correlator::ResponseCorrelator` (p. 2239), `activemq::transport::logging::LoggingTransport` (p. 1639), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 1986).

6.565.3.16 `virtual void activemq::transport::TransportFilter::setTransportListener (TransportListener * listener) [inline, virtual]`

Sets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).

Parameters:

listener the listener of **transport** (p. 67) events.

Implements `activemq::transport::Transport` (p. 2612).

6.565.3.17 `virtual void activemq::transport::TransportFilter::setWireFormat (const Pointer< wireformat::WireFormat > & wireFormat) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 59).

Implements `activemq::transport::Transport` (p. 2612).

6.565.3.18 `virtual void activemq::transport::TransportFilter::start () throw (cms::CMSException) [inline, virtual]`

Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59). If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

CMSException if an error occurs or if this **transport** (p. 67) has already been closed.

Implements **cms::Startable** (p. 2413).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2240), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1987).

6.565.3.19 virtual void activemq::transport::TransportFilter::transportInterrupted () [inline, virtual]

The **transport** (p. 67) has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2625).

6.565.3.20 virtual void activemq::transport::TransportFilter::transportResumed () [inline, virtual]

The **transport** (p. 67) has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 2625).

6.565.4 Field Documentation

6.565.4.1 TransportListener* activemq::transport::TransportFilter::listener [protected]

Listener of this **transport** (p. 67).

6.565.4.2 Pointer<Transport> activemq::transport::TransportFilter::next [protected]

The **transport** (p. 67) that this filter wraps around.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportFilter.h**

6.566 activemq::transport::TransportListener Class Reference

A listener of asynchronous **exceptions** (p. 62) from a command **transport** (p. 67) object.

#include <src/main/activemq/transport/TransportListener.h> Inheritance diagram for activemq::transport::TransportListener:

Public Member Functions

- virtual **~TransportListener** ()
- virtual void **onCommand** (const **Pointer< Command >** &command)=0
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex)=0
*Event handler for an exception from a command **transport** (p. 67).*
- virtual void **transportInterrupted** ()=0
*The **transport** (p. 67) has suffered an interruption from which it hopes to recover.*
- virtual void **transportResumed** ()=0
*The **transport** (p. 67) has resumed after an interruption.*

6.566.1 Detailed Description

A listener of asynchronous **exceptions** (p. 62) from a command **transport** (p. 67) object.

6.566.2 Constructor & Destructor Documentation

- 6.566.2.1** virtual **activemq::transport::TransportListener::~~TransportListener** ()
[inline, virtual]

6.566.3 Member Function Documentation

- 6.566.3.1** virtual void **activemq::transport::TransportListener::onCommand** (const **Pointer< Command >** & *command*) [pure virtual]

Event handler for the receipt of a command. The **transport** (p. 67) passes off all received **commands** (p. 59) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2608) deletes the command upon receipt.

Parameters:

command the received command object.

Implemented in **activemq::core::ActiveMQConnection** (p. 197), **activemq::transport::correlator::ResponseCorrelator** (p. 2238), **activemq::transport::failover::FailoverTransportListener** (p. 1312),

activemq::transport::logging::LoggingTransport (p. 1638), **ac-**
tivemq::transport::mock::InternalCommandListener (p. 1457),
activemq::transport::TransportFilter (p. 2620), and **ac-**
tivemq::wireformat::openwire::OpenWireFormatNegotiator (p. 1985).

6.566.3.2 virtual void activemq::transport::TransportListener::onException (const decaf::lang::Exception & *ex*) [pure virtual]

Event handler for an exception from a command **transport** (p. 67).

Parameters:

ex The exception being propagated to this listener to handle.

Implemented in **activemq::core::ActiveMQConnection** (p. 197),
activemq::transport::failover::BackupTransport (p. 502), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1312), and **ac-**
tivemq::transport::TransportFilter (p. 2621).

6.566.3.3 virtual void activemq::transport::TransportListener::transportInterrupted () [pure virtual]

The **transport** (p. 67) has suffered an interruption from which it hopes to recover.

Implemented in **activemq::core::ActiveMQConnection** (p. 199),
activemq::transport::DefaultTransportListener (p. 1186), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1312), and **ac-**
tivemq::transport::TransportFilter (p. 2623).

6.566.3.4 virtual void activemq::transport::TransportListener::transportResumed () [pure virtual]

The **transport** (p. 67) has resumed after an interruption.

Implemented in **activemq::core::ActiveMQConnectionSupport** (p. 215),
activemq::transport::DefaultTransportListener (p. 1186), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1312), and **ac-**
tivemq::transport::TransportFilter (p. 2623).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportListener.h**

6.567 activemq::transport::TransportRegistry Class Reference

Registry of all **Transport** (p. 2608) Factories that are available to the client at runtime.

```
#include <src/main/activemq/transport/TransportRegistry.h>
```

Public Member Functions

- virtual **~TransportRegistry** ()
- **TransportFactory** * **findFactory** (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)

*Gets a Registered **TransportFactory** (p. 2614) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **TransportFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

*Registers a new **TransportFactory** (p. 2614) with this Registry.*

- void **unregisterFactory** (const std::string &name)

Unregisters the Factory with the given name and deletes that instance of the Factory.

- std::vector< std::string > **getTransportNames** () const

Retrieves a list of the names of all the Registered Transport's in this Registry.

Static Public Member Functions

- static **TransportRegistry** & **getInstance** ()

*Gets the single instance of the **TransportRegistry** (p. 2626).*

6.567.1 Detailed Description

Registry of all **Transport** (p. 2608) Factories that are available to the client at runtime. New Transport's must have a factory registered here before a connection attempt is made.

Since:

3.0

6.567.2 Constructor & Destructor Documentation

6.567.2.1 `virtual activemq::transport::TransportRegistry::~TransportRegistry ()`
[virtual]

6.567.3 Member Function Documentation

6.567.3.1 `TransportFactory* activemq::transport::TransportRegistry::findFactory (const std::string & name) const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets a Registered **TransportFactory** (p. 2614) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters:

name The name of the Factory to find in the Registry.

Returns:

the Factory registered under the given name.

Exceptions:

NoSuchElementException if no factory is registered with that name.

6.567.3.2 `static TransportRegistry& activemq::transport::TransportRegistry::getInstance ()`
[static]

Gets the single instance of the **TransportRegistry** (p. 2626).

Returns:

reference to the single instance of this Registry

6.567.3.3 `std::vector<std::string> activemq::transport::TransportRegistry::getTransportNames () const`

Retrieves a list of the names of all the Registered Transport's in this Registry.

Returns:

std vector of strings with all the **Transport** (p. 2608) names registered.

6.567.3.4 `void activemq::transport::TransportRegistry::registerFactory (const std::string & name, TransportFactory * factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)`

Registers a new **TransportFactory** (p. 2614) with this Registry. If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters:

- name* The name of the new Factory to register.
factory The new Factory to add to the Registry.

Exceptions:

- IllegalArgumentException* if name is the empty string.
NullPointerException if the Factory is Null.

6.567.3.5 void activemq::transport::TransportRegistry::unregisterFactory (const std::string & name)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters:

- name* Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportRegistry.h**

6.568 decaf::net::UnknownHostException Class Reference

#include <src/main/decaf/net/UnknownHostException.h> Inheritance diagram for decaf::net::UnknownHostException:

Public Member Functions

- **UnknownHostException** () throw ()
Default Constructor.
- **UnknownHostException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **UnknownHostException** (const **UnknownHostException** &ex) throw ()
Copy Constructor.
- **UnknownHostException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownHostException** (const std::exception *cause) throw ()
Constructor.
- **UnknownHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownHostException** * clone () const
Clones this exception.
- virtual ~**UnknownHostException** () throw ()

6.568.1 Constructor & Destructor Documentation

6.568.1.1 decaf::net::UnknownHostException::UnknownHostException () throw () [inline]

Default Constructor.

6.568.1.2 decaf::net::UnknownHostException::UnknownHostException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.568.1.3 decaf::net::UnknownHostException::UnknownHostException (const UnknownHostException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.568.1.4 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.568.1.5 decaf::net::UnknownHostException::UnknownHostException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.568.1.6 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.568.1.7 virtual decaf::net::UnknownHostException::~~UnknownHostException ()
throw () [inline, virtual]

6.568.2 Member Function Documentation

6.568.2.1 virtual UnknownHostException* decaf::net::UnknownHostException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1479).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**UnknownHostException.h**

6.569 decaf::net::UnknownServiceException Class Reference

#include <src/main/decaf/net/UnknownServiceException.h> Inheritance diagram for decaf::net::UnknownServiceException:

Public Member Functions

- **UnknownServiceException** () throw ()
Default Constructor.
- **UnknownServiceException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **UnknownServiceException** (const **UnknownServiceException** &ex) throw ()
Copy Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownServiceException** (const std::exception *cause) throw ()
Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownServiceException** * clone () const
Clones this exception.
- virtual ~**UnknownServiceException** () throw ()

6.569.1 Constructor & Destructor Documentation

6.569.1.1 decaf::net::UnknownServiceException::UnknownServiceException () throw () [inline]

Default Constructor.

6.569.1.2 decaf::net::UnknownServiceException::UnknownServiceException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.569.1.3 decaf::net::UnknownServiceException::UnknownServiceException (const UnknownServiceException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.569.1.4 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.569.1.5 decaf::net::UnknownServiceException::UnknownServiceException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.569.1.6 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.569.1.7 **virtual**
 decaf::net::UnknownServiceException::~UnknownServiceException ()
 throw () [inline, virtual]

6.569.2 Member Function Documentation

6.569.2.1 **virtual UnknownServiceException* de-**
 caf::net::UnknownServiceException::clone () const
 [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

 a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1479).

6.570.1 Constructor & Destructor Documentation

6.570.1.1 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException () throw () [inline]

Default Constructor.

6.570.1.2 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex An exception that should become this type of **Exception** (p. 1268)

6.570.1.3 `decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException`
`(const UnsupportedOperationException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex An exception that should become this type of **Exception** (p. 1268)

6.570.1.4 `decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException`
`(const char * file, const int lineNumber, const std::exception * cause,
const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.570.1.5 `decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException`
`(const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.570.1.6 `decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException`
`(const char * file, const int lineNumber, const char * msg, ...) throw ()`
`[inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.570.1.7 **virtual**
decaf::lang::exceptions::UnsupportedOperationException::~~UnsupportedOperationException()
() throw () [inline, virtual]

6.570.2 Member Function Documentation

6.570.2.1 **virtual UnsupportedOperationException* de-**
caf::lang::exceptions::UnsupportedOperationException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1268) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

Reimplemented in **decaf::nio::ReadOnlyBufferException** (p. 2169).

6.571.1 Detailed Description

This class represents an instance of a **URI** (p. 2638) as defined by RFC 2396.

6.571.2 Constructor & Destructor Documentation

6.571.2.1 `decaf::net::URI::URI ()`

Default Constructor, same as calling a Constructor with all fields empty.

6.571.2.2 `decaf::net::URI::URI (const URI & uri) throw (URISyntaxException)`

Constructs a **URI** (p. 2638) as a copy of another **URI** (p. 2638).

Parameters:

uri - uri to copy

6.571.2.3 `decaf::net::URI::URI (const std::string & uri) throw (URISyntaxException)`

Constructs a **URI** (p. 2638) from the given string.

Parameters:

uri - string uri to parse.

6.571.2.4 `decaf::net::URI::URI (const std::string & scheme, const std::string & ssp, const std::string & fragment) throw (URISyntaxException)`

Constructs a **URI** (p. 2638) from the given components.

Parameters:

scheme - the uri scheme

ssp - Scheme specific part

fragment - Fragment

6.571.2.5 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *userInfo*, const std::string & *host*, int *port*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 2638) from the given components.

Parameters:

scheme - Scheme name

userInfo - User name and authorization information

host - Host name

port - Port number

path - Path

query - Query

fragment - Fragment

6.571.2.6 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *host*, const std::string & *path*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 2638) from the given components.

Parameters:

scheme - Scheme name

host - Host name

path - Path

fragment - Fragment

6.571.2.7 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *authority*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 2638) from the given components.

Parameters:

scheme - Scheme name

authority - Authority

path - Path

query - Query

fragment - Fragment

6.571.2.8 `virtual decaf::net::URI::~~URI ()` [inline, virtual]

6.571.3 Member Function Documentation

6.571.3.1 `virtual int decaf::net::URI::compareTo (const URI & value) const`
[virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the value to compare to this one.

Returns:

zero if equal minus one if less than and one if greater than.

6.571.3.2 `static URI decaf::net::URI::create (const std::string uri) throw (`
`lang::exceptions::IllegalArgumentException)` [static]

Creates a **URI** (p. 2638) by parsing the given string. This convenience factory method works as if by invoking the `URI(string)` constructor; any **URISyntaxException** (p. 2665) thrown by the constructor is caught and wrapped in a new `IllegalArgumentException` object, which is then thrown.

Parameters:

uri - **URI** (p. 2638) string to parse

Exceptions:

IllegalArgumentException

6.571.3.3 `virtual bool decaf::net::URI::equals (const URI & value) const` [virtual]

Returns:

true if this value is considered equal to the passed value.

6.571.3.4 `std::string decaf::net::URI::getAuthority () const`

Returns:

the decoded authority component of this **URI** (p. 2638).

6.571.3.5 `std::string decaf::net::URI::getFragment () const`

Returns:

the decoded fragment component of this **URI** (p. 2638).

6.571.3.6 std::string decaf::net::URI::getHost () const**Returns:**

the host component of this **URI** (p. 2638).

6.571.3.7 std::string decaf::net::URI::getPath () const**Returns:**

the path component of this **URI** (p. 2638).

6.571.3.8 int decaf::net::URI::getPort () const**Returns:**

the port component of this **URI** (p. 2638).

6.571.3.9 std::string decaf::net::URI::getQuery () const**Returns:**

the query component of this **URI** (p. 2638).

6.571.3.10 std::string decaf::net::URI::getRawAuthority () const

Returns the raw authority component of this **URI** (p. 2638). The authority component of a **URI** (p. 2638), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

Returns:

the raw authority component of the **URI** (p. 2638)

6.571.3.11 std::string decaf::net::URI::getRawFragment () const

Returns the raw fragment component of this **URI** (p. 2638). The fragment component of a **URI** (p. 2638), if defined, only contains legal **URI** (p. 2638) characters.

Returns:

the raw fragment component of this **URI** (p. 2638)

6.571.3.12 std::string decaf::net::URI::getRawPath () const

Returns the raw path component of this **URI** (p. 2638). The path component of a **URI** (p. 2638), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

Returns:

the raw path component of this **URI** (p. 2638)

6.571.3.13 std::string decaf::net::URI::getRawQuery () const

Returns the raw query component of this **URI** (p. 2638). The query component of a **URI** (p. 2638), if defined, only contains legal **URI** (p. 2638) characters.

Returns:

the raw query component of the **URI** (p. 2638).

6.571.3.14 std::string decaf::net::URI::getRawSchemeSpecificPart () const

Returns the raw scheme-specific part of this **URI** (p. 2638). The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 2638) only contains legal **URI** (p. 2638) characters.

Returns:

the raw scheme special part of the uri

6.571.3.15 std::string decaf::net::URI::getRawUserInfo () const

Returns the raw user-information component of this **URI** (p. 2638). The user-information component of a **URI** (p. 2638), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

Returns:

the raw user-information component of the **URI** (p. 2638)

6.571.3.16 std::string decaf::net::URI::getScheme () const**Returns:**

the scheme component of this **URI** (p. 2638)

6.571.3.17 std::string decaf::net::URI::getSchemeSpecificPart () const

Returns the decoded scheme-specific part of this **URI** (p. 2638). The string returned by this method is equal to that returned by the `getRawSchemeSpecificPart` method except that all sequences of escaped octets are decoded.

Returns:

the raw scheme specific part of the uri.

6.571.3.18 std::string decaf::net::URI::getUserInfo () const**Returns:**

the user info component of this **URI** (p. 2638)

6.571.3.19 bool decaf::net::URI::isAbsolute () const

Tells whether or not this **URI** (p. 2638) is absolute. A **URI** (p. 2638) is absolute if, and only if, it has a scheme component.

Returns:

true if, and only if, this **URI** (p. 2638) is absolute

6.571.3.20 bool decaf::net::URI::isOpaque () const

Tells whether or not this **URI** (p. 2638) is opaque. A **URI** (p. 2638) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 2638) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

Returns:

true if, and only if, this **URI** (p. 2638) is opaque

6.571.3.21 URI decaf::net::URI::normalize () const

Normalizes this **URI**'s path. If this **URI** (p. 2638) is opaque, or if its path is already in normal form, then this **URI** (p. 2638) is returned. Otherwise a new **URI** (p. 2638) is constructed that is identical to this **URI** (p. 2638) except that its path is computed by normalizing this **URI**'s path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed. 2. If a ".." segment is preceded by a non-".." segment then both of these segments are removed. This step is repeated until it is no longer applicable. 3. If the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 2638) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 2638) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more "." segments if there were insufficient non-".." segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or ".." segments.

Returns:

A **URI** (p. 2638) equivalent to this **URI** (p. 2638), but whose path is in normal form

6.571.3.22 virtual bool decaf::net::URI::operator< (const URI & value) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.571.3.23 `virtual bool decaf::net::URI::operator==(const URI & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.571.3.24 `URI decaf::net::URI::parseServerAuthority () const throw (`
`URISyntaxException)`

Attempts to parse this URI's authority component, if defined, into user-information, host, and port components. If this URI's authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p.2638) has no authority component, this method simply returns this **URI** (p.2638).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

Returns:

A **URI** (p.2638) whose authority field has been parsed as a server-based authority

Exceptions:

URISyntaxException (p.2665) - If the authority component of this **URI** (p.2638) is defined but cannot be parsed as a server-based authority.

6.571.3.25 `URI decaf::net::URI::relativize (const URI & uri) const`

Relativizes the given **URI** (p.2638) against this **URI** (p.2638). The relativization of the given **URI** (p.2638) against this **URI** (p.2638) is computed as follows:

1. If either this **URI** (p.2638) or the given **URI** (p.2638) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p.2638) is not a prefix of the path of the given **URI** (p.2638), then the given **URI** (p.2638) is returned.
2. Otherwise a new relative hierarchical **URI** (p.2638) is constructed with query and fragment components taken from the given **URI** (p.2638) and with a path component computed by removing this URI's path from the beginning of the given URI's path.

Parameters:

uri - The **URI** (p. 2638) to be relativized against this **URI** (p. 2638)

Returns:

The resulting **URI** (p. 2638)

6.571.3.26 URI decaf::net::URI::resolve (const URI & uri) const

Resolves the given **URI** (p. 2638) against this **URI** (p. 2638). If the given **URI** (p. 2638) is already absolute, or if this **URI** (p. 2638) is opaque, then a copy of the given **URI** (p. 2638) is returned.

If the given **URI**'s fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 2638) with the given fragment but with all other components equal to those of this **URI** (p. 2638) is returned. This allows a **URI** (p. 2638) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 2638).

Otherwise this method constructs a new hierarchical **URI** (p. 2638) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 2638) is constructed with this **URI**'s scheme and the given **URI**'s query and fragment components.
2. If the given **URI** (p. 2638) has an authority component then the new **URI**'s authority and path are taken from the given **URI** (p. 2638).
3. Otherwise the new **URI**'s authority component is copied from this **URI** (p. 2638), and its path is computed as follows:

1. If the given **URI**'s path is absolute then the new **URI**'s path is taken from the given **URI** (p. 2638).
2. Otherwise the given **URI**'s path is relative, and so the new **URI**'s path is computed by resolving the path of the given **URI** (p. 2638) against the path of this **URI** (p. 2638). This is done by concatenating all but the last segment of this **URI**'s path, if any, with the given **URI**'s path and then normalizing the result as if by invoking the `normalize` method.

The result of this method is absolute if, and only if, either this **URI** (p. 2638) is absolute or the given **URI** (p. 2638) is absolute.

Parameters:

uri - The **URI** (p. 2638) to be resolved against this **URI** (p. 2638)

Returns:

The resulting **URI** (p. 2638)

6.571.3.27 URI decaf::net::URI::resolve (const std::string & str) const throw (lang::exceptions::IllegalArgumentException)

Constructs a new **URI** (p. 2638) by parsing the given string and then resolving it against this **URI** (p. 2638). This convenience method works as if invoking it were equivalent to evaluating the expression `resolve(URI::create(str))`.

Parameters:

str - The string to be parsed into a **URI** (p. 2638)

Returns:

The resulting **URI** (p. 2638)

Exceptions:

IllegalArgumentException - If the given string violates RFC 2396

6.571.3.28 `std::string decaf::net::URI::toString () const`

Returns the content of this **URI** (p. 2638) as a string. If this **URI** (p. 2638) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 2638) was created by normalization, resolution, or relativization, and so a string is constructed from this **URI**'s components according to the rules specified in RFC 2396, section 5.2, step 7.

Returns:

the string form of this **URI** (p. 2638)

6.571.3.29 `URL decaf::net::URI::toURL () const throw (MalformedURLException, lang::exceptions::IllegalArgumentException)`

Constructs a **URL** (p. 2677) from this **URI** (p. 2638). This convenience method works as if invoking it were equivalent to evaluating the expression `new URL (p. 2677)(this.toString())` after first checking that this **URI** (p. 2638) is absolute.

Returns:

A **URL** (p. 2677) constructed from this **URI** (p. 2638)

Exceptions:

IllegalArgumentException - If this **URL** (p. 2677) is not absolute

MalformedURLException (p. 1686) - If a protocol handler for the **URL** (p. 2677) could not be found, or if some other error occurred while constructing the **URL** (p. 2677)

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URI.h`

6.572 decaf::internal::net::URLEncoderDecoder Class Reference

```

Public Member Functions

- **URLEncoderDecoder** ()
- virtual **~URLEncoderDecoder** ()

Static Public Member Functions

- static void **validate** (const std::string &s, const std::string &legal) throw (decaf::net::URISyntaxException)
Validate a string by checking if it contains any characters other than:.
- static void **validateSimple** (const std::string &s, const std::string &legal) throw (decaf::net::URISyntaxException)
Validate a string by checking if it contains any characters other than:.
- static std::string **quoteIllegal** (const std::string &s, const std::string &legal)
All characters except letters ('a').
- static std::string **encodeOthers** (const std::string &s)
Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.
- static std::string **decode** (const std::string &s)
Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme.

6.572.1 Constructor & Destructor Documentation

6.572.1.1 decaf::internal::net::URLEncoderDecoder::URLEncoderDecoder ()

6.572.1.2 virtual decaf::internal::net::URLEncoderDecoder::~~URLEncoderDecoder () [inline, virtual]

6.572.2 Member Function Documentation

6.572.2.1 static std::string decaf::internal::net::URLEncoderDecoder::decode (const std::string & s) [static]

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme. " and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C \$%"

Parameters:

s - The encoded string.

Returns:

The decoded version.

6.572.2.2 `static std::string decaf::internal::net::URIEncoderDecoder::encodeOthers
(const std::string & s) [static]`

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved. They are converted into their hexadecimal value prepended by ”.

For example: Euro currency symbol -> "%E2%82%AC".

Parameters:

s - the string to be converted

Returns:

the converted string

6.572.2.3 `static std::string decaf::internal::net::URIEncoderDecoder::quoteIllegal
(const std::string & s, const std::string & legal) [static]`

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by ”.

For example: '#' -> 23

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

Parameters:

s - the string to be converted

legal - the characters allowed to be preserved in the string *s*

Returns:

converted string

6.572.2.4 `static void decaf::internal::net::URIEncoderDecoder::validate
(const std::string & s, const std::string & legal) throw (
decaf::net::URISyntaxException) [static]`

Validate a string by checking if it contains any characters other than: 1. letters ('a'..'z', 'A'..'Z') 2. numbers ('0'..'9') 3. characters in the legalset parameter 4. characters that are not ISO Control or are not ISO Space characters)

Parameters:

s - the string to be validated

legal - the characters allowed in the string *s*

6.572.2.5 static void decaf::internal::net::URIEncoderDecoder::validateSimple
(const std::string & *s*, const std::string & *legal*) throw (
decaf::net::URISyntaxException) [static]

Validate a string by checking if it contains any characters other than: 1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9') 3. characters in the legalset parameter

Parameters:

- s* - the string to be validated
- legal* - the characters allowed in the string *s*

The documentation for this class was generated from the following file:

6.573 decaf::internal::net::URIHelper Class Reference

Helper class used by the URI classes in encoding and decoding of URI's.

```
#include <src/main/decaf/internal/net/URIHelper.h>
```

Public Member Functions

- **URIHelper** (const std::string &unreserved, const std::string &punct, const std::string &reserved, const std::string &someLegal, const std::string &allLegal)

*Setup the **URIHelper** (p. 2652) with values assigned to the various fields that are used in the validation process.*

- **URIHelper** ()

Sets up the filter strings with sane defaults.

- virtual ~**URIHelper** ()

- **URIType parseURI** (const std::string &uri, bool forceServer) throw (decaf::net::URISyntaxException)

Parse the passed in URI.

- void **validateScheme** (const std::string &uri, const std::string &scheme, int index) throw (decaf::net::URISyntaxException)

Validate the schema portin of the URI.

- void **validateSsp** (const std::string &uri, const std::string &ssp, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Ssp Segment contains no invalid encodings.

- void **validateAuthority** (const std::string &uri, const std::string &authority, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Authority Segment contains no invalid encodings.

- void **validatePath** (const std::string &uri, const std::string &path, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Path Segment contains no invalid encodings.

- void **validateQuery** (const std::string &uri, const std::string &query, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Query Segment contains no invalid encodings.

- void **validateFragment** (const std::string &uri, const std::string &fragment, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI fragment contains no invalid encodings.

- **URIType parseAuthority** (bool forceServer, const std::string &authority) throw (decaf::net::URISyntaxException)

determine the host, port and user-info if the authority parses successfully to a server based authority

- void **validateUserinfo** (const std::string &uri, const std::string &userinfo, std::size_t index) throw (decaf::net::URISyntaxException)
Check the supplied user info for validity.
- bool **isValidHost** (bool forceServer, const std::string &host) throw (decaf::net::URISyntaxException)
distinguish between IPv4, IPv6, domain name and validate it based on its type
- bool **isValidDomainName** (const std::string &host)
Validates the string past to determine if it is a well formed domain name.
- bool **isValidIPv4Address** (const std::string &host)
Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.
- bool **isValidIPv6Address** (const std::string &ipAddress)
Determines if the given address is valid according to the IPv6 spec.
- bool **isValidIPv4Word** (const std::string &word)
Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.
- bool **isValidHexChar** (char c)
Determines if the given char is a valid Hex char.

6.573.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

6.573.2 Constructor & Destructor Documentation

6.573.2.1 decaf::internal::net::URIHelper::URIHelper (const std::string & *unreserved*, const std::string & *punct*, const std::string & *reserved*, const std::string & *someLegal*, const std::string & *allLegal*)

Setup the **URIHelper** (p. 2652) with values assigned to the various fields that are used in the validation process. The defaults are overridden by these values.

Parameters:

- unreserved* - characters not reserved for use.
- punct* - allowable punctuation symbols.
- reserved* - characters not allowed for general use in the URI.
- someLegal* - characters that are legal in certain cases.
- allLegal* - characters that are always legal.

6.573.2.2 decaf::internal::net::URIHelper::URIHelper ()

Sets up the filter strings with sane defaults.

6.573.2.3 `virtual decaf::internal::net::URIHelper::~~URIHelper () [inline, virtual]`

6.573.3 Member Function Documentation

6.573.3.1 `bool decaf::internal::net::URIHelper::isValidDomainName (const std::string & host)`

Validates the string past to determine if it is a well formed domain name.

Parameters:

host - domain name to validate.

Returns:

true if host is well formed.

6.573.3.2 `bool decaf::internal::net::URIHelper::isValidHexChar (char c)`

Determines if the given char is a valid Hex char. Valid chars are A-F (upper or lower case) and 0-9.

Parameters:

c - char to inspect

Returns:

true if *c* is a valid hex char.

6.573.3.3 `bool decaf::internal::net::URIHelper::isValidHost (bool forceServer, const std::string & host) throw (decaf::net::URISyntaxException)`

distinguish between IPv4, IPv6, domain name and validate it based on its type

Parameters:

forceServer - true if the forceServer mode should be active.

host - Host string to validate.

Returns:

true if the host value if a valid domain name.

Exceptions:

URISyntaxException if the host is invalid and forceServer is true.

6.573.3.4 `bool decaf::internal::net::URIHelper::isValidIP4Word (const std::string & word)`

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

Parameters:

word - string value to check.

Returns:

true if the word is a valid IPv4 word.

6.573.3.5 bool decaf::internal::net::URIHelper::isValidIPv6Address (const std::string & *ipAddress*)

Determines if the given address is valid according to the IPv6 spec.

Parameters:

ipAddress - string ip address value to validate.

Returns:

true if the address string is valid.

6.573.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address (const std::string & *host*)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9. and XXX is not greater than 255.

Parameters:

host - IPv4 address string to parse.

Returns:

true if host is a well formed IPv4 address.

6.573.3.7 URIType decaf::internal::net::URIHelper::parseAuthority (bool *forceServer*, const std::string & *authority*) throw (decaf::net::URISyntaxException)

determine the host, port and user-info if the authority parses successfully to a server based authority behavior in error cases: if forceServer is true, throw URISyntaxException with the proper diagnostic messages. if forceServer is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where URISyntaxException is thrown regardless of the forceServer parameter e.g. mal-formed ipv6 address

Parameters:

forceServer
authority

Returns:

a URIType (p. 2669) instance containing the parsed data.

Exceptions:

URISyntaxException

6.573.3.8 `URIType decaf::internal::net::URIHelper::parseURI (const std::string & uri, bool forceServer) throw (decaf::net::URISyntaxException)`

Parse the passed in URI.

Parameters:

uri - the URI to Parse

forceServer - if true invalid URI data throws an Exception

Returns:

a `URIType` (p. 2669) instance containing the parsed data.

Exceptions:

URISyntaxException if forceServer is true and the URI is invalid.

6.573.3.9 `void decaf::internal::net::URIHelper::validateAuthority (const std::string & uri, const std::string & authority, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI Authority Segment contains no invalid encodings.

Parameters:

uri - the full uri.

authority - the Authority to check.

index - position in the uri where Authority starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.573.3.10 `void decaf::internal::net::URIHelper::validateFragment (const std::string & uri, const std::string & fragment, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI fragment contains no invalid encodings.

Parameters:

uri - the full uri.

fragment - the fragment to check.

index - position in the uri where fragment starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.573.3.11 void decaf::internal::net::URIHelper::validatePath (const std::string & *uri*, const std::string & *path*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Path Segment contains no invalid encodings.

Parameters:

uri - the full uri.

path - the path to check.

index - position in the uri where path starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.573.3.12 void decaf::internal::net::URIHelper::validateQuery (const std::string & *uri*, const std::string & *query*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Query Segment contains no invalid encodings.

Parameters:

uri - the full uri.

query - the query to check.

index - position in the uri where fragment starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.573.3.13 void decaf::internal::net::URIHelper::validateScheme (const std::string & *uri*, const std::string & *scheme*, int *index*) throw (decaf::net::URISyntaxException)

Validate the schema portin of the URI.

Parameters:

uri - the URI to check.

scheme - the schema section of the URI.

index - index in uri where schema starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.573.3.14 void decaf::internal::net::URIHelper::validateSsp (const std::string & *uri*, const std::string & *ssp*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Ssp Segment contains no invalid encodings.

Parameters:

uri - the full uri.

ssp - the SSP to check.

index - position in the uri where Ssp starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.573.3.15 void decaf::internal::net::URIHelper::validateUserinfo (const std::string & *uri*, const std::string & *userinfo*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Check the supplied user info for validity.

Parameters:

uri - the uri to parse.

userinfo - supplied user info

index - index into the URI string where the data is located.

Returns:

true if valid

Exceptions:

URISyntaxException if an error occurs

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**URIHelper.h**

6.574 activemq::transport::failover::URIPool Class Reference

```
#include <src/main/activemq/transport/failover/URIPool.h>
```

Public Member Functions

- **URIPool** ()
Create an Empty URI Pool.
- **URIPool** (const **decaf::util::List**< **URI** > &uris)
Creates a new URI Pool using the given list as the initial Free List.
- virtual **~URIPool** ()
- **URI** **getURI** () throw (**decaf::lang::exceptions::NoSuchElementException**)
Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a `NoSuchElementException`.
- void **addURI** (const **URI** &uri)
Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.
- void **addURIs** (const **StlList**< **URI** > &uris)
Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.
- void **removeURI** (const **URI** &uri)
Remove a given URI from the Free List.
- bool **isRandomize** () const
Is the URI that is given randomly picked from the pool or is each one taken in sequence.
- void **setRandomize** (bool value)
Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

6.574.1 Constructor & Destructor Documentation

6.574.1.1 activemq::transport::failover::URIPool::URIPool ()

Create an Empty URI Pool.

6.574.1.2 activemq::transport::failover::URIPool::URIPool (const **decaf::util::List**< **URI** > & *uris*)

Creates a new URI Pool using the given list as the initial Free List.

Parameters:

uris - List of URI to place in the Pool.

6.574.1.3 `virtual activemq::transport::failover::URIPool::~~URIPool ()` [virtual]

6.574.2 Member Function Documentation

6.574.2.1 `void activemq::transport::failover::URIPool::addURI (const URI & uri)`

Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.

Parameters:

uri - a URI previously taken from the pool.

6.574.2.2 `void activemq::transport::failover::URIPool::addURIs (const StlList< URI > & uris)`

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

Parameters:

uris - List of URIs to add into the Pool.

6.574.2.3 `URI activemq::transport::failover::URIPool::getURI () throw (decaf::lang::exceptions::NoSuchElementException)`

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a `NoSuchElementException`. Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

Returns:

the next free URI in the Pool.

Exceptions:

NoSuchElementException if there are none free currently.

6.574.2.4 `bool activemq::transport::failover::URIPool::isRandomize () const [inline]`

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

Returns:

true if URI gets are random.

6.574.2.5 `void activemq::transport::failover::URIPool::removeURI (const URI & uri)`

Remove a given URI from the Free List.

Parameters:

uri - the URI to find and remove from the free list

**6.574.2.6 void activemq::transport::failover::URIPool::setRandomize (bool *value*)
[inline]**

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

Parameters:

value - true indicates URI gets are random.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**URIPool.h**

6.575 activemq::util::URISupport Class Reference

```
#include <src/main/activemq/util/URISupport.h>
```

Static Public Member Functions

- static void **parseURL** (const std::string &URI, **decaf::util::Properties** &properties) throw (**decaf::lang::exceptions::IllegalArgumentException**)
Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.
- static **CompositeData** **parseComposite** (const **URI** &uri) throw (**decaf::net::URISyntaxException**)
Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.
- static **decaf::util::Properties** **parseQuery** (std::string query) throw (**decaf::lang::exceptions::IllegalArgumentException**)
Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.
- static void **parseQuery** (std::string query, **decaf::util::Properties** *properties) throw (**decaf::lang::exceptions::IllegalArgumentException**)
Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.
- static std::string **createQueryString** (const **Properties** &options) throw (**decaf::net::URISyntaxException**)
Given a properties object create a string that can be appended to a URI as a valid Query string.

6.575.1 Member Function Documentation

- 6.575.1.1** static std::string **activemq::util::URISupport::createQueryString** (const **Properties** & *options*) throw (**decaf::net::URISyntaxException**)
 [static]

Given a properties object create a string that can be appended to a URI as a valid Query string.

Parameters:

options Properties object containing key / value query values.

Returns:

a valid URI query string.

Exceptions:

URISyntaxException if the string in the Properties object can't be encoded into a valid URI Query string.

6.575.1.2 static CompositeData activemq::util::URISupport::parseComposite (const URI & *uri*) throw (decaf::net::URISyntaxException) [static]

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

Parameters:

uri - The Composite URI to parse.

Returns:

a new **CompositeData** (p. 904) object with the parsed data

Exceptions:

URISyntaxException if the URI is not well formed.

6.575.1.3 static void activemq::util::URISupport::parseQuery (std::string *query*, decaf::util::Properties * *properties*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters:

query - the query string to parse.

properties - object pointer to get the parsed output.

Exceptions:

IllegalArgumentException if the Query string is not well formed.

6.575.1.4 static decaf::util::Properties activemq::util::URISupport::parseQuery (std::string *query*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters:

query The query string to parse and extract the encoded properties.

Returns:

Properties object with the parsed output.

Exceptions:

IllegalArgumentException if the Query string is not well formed.

6.575.1.5 `static void activemq::util::URISupport::parseURL (const
std::string & URI, decaf::util::Properties & properties) throw (
decaf::lang::exceptions::IllegalArgumentException) [static]`

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

Parameters:

URI a Broker URI to parse

properties a Properties object to set the parsed values in

Exceptions:

IllegalArgumentException if the passed URI is invalid

The documentation for this class was generated from the following file:

- `src/main/activemq/util/URISupport.h`

6.576 decaf::net::URISyntaxException Class Reference

#include <src/main/decaf/net/URISyntaxException.h> Inheritance diagram for decaf::net::URISyntaxException:

Public Member Functions

- **URISyntaxException** () throw ()
Default Constructor.
- **URISyntaxException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **URISyntaxException** (const **URISyntaxException** &ex) throw ()
Copy Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.

6.576.1 Constructor & Destructor Documentation

6.576.1.1 decaf::net::URISyntaxException::URISyntaxException () throw () [inline]

Default Constructor.

6.576.1.2 `decaf::net::URISyntaxException::URISyntaxException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.576.1.3 `decaf::net::URISyntaxException::URISyntaxException (const URISyntaxException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.576.1.4 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.576.1.5 `decaf::net::URISyntaxException::URISyntaxException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.576.1.6 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const char *msg DECAF_UNUSED) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.576.1.7 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the input string that caused the error and the reason for the error.

Parameters:

file The file name where exception occurs.
lineNumber The line number where the exception occurred.
input The **URL** (p.2677) that caused the exception.
reason The reason for the failure.

6.576.1.8 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*, std::size_t *index*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the input string that caused the error and the reason for the error.

Parameters:

file The file name where exception occurs
lineNumber The line number where the exception occurred.
input The input **URI** (p.2638) that caused the exception
reason The reason for the failure.
index The index in the **URI** (p.2638) string where the error occurred.

6.576.1.9 virtual decaf::net::URISyntaxException::~~URISyntaxException () throw () [inline, virtual]

6.576.2 Member Function Documentation

6.576.2.1 virtual URISyntaxException* decaf::net::URISyntaxException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p.1271).

6.576.2.2 `std::size_t decaf::net::URISyntaxException::getIndex () const [inline]`

Returns:

the index in the input string where the error occurred or -1

6.576.2.3 `std::string decaf::net::URISyntaxException::getInput () const [inline]`

Returns:

the Input string that cause this exception or ""

6.576.2.4 `std::string decaf::net::URISyntaxException::getReason () const [inline]`

Returns:

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URISyntaxException.h`

6.577 decaf::internal::net::URIType Class Reference

Basic type object that holds data that composes a given URI.

```
#include <src/main/decaf/internal/net/URIType.h>
```

Public Member Functions

- **URIType** (const std::string &source)
- **URIType** ()
- virtual ~**URIType** ()
- std::string **getSource** () const
*Gets the source URI string that was parsed to obtain this **URIType** (p. 2669) instance and the resulting data,.*
- void **setSource** (const std::string &source)
*Sets the source URI string that was parsed to obtain this **URIType** (p. 2669) instance and the resulting data,.*
- std::string **getScheme** () const
Gets the Scheme of the URI, e.g.
- void **setScheme** (const std::string &scheme)
Sets the Scheme of the URI, e.g.
- std::string **getSchemeSpecificPart** () const
Gets the Scheme Specific Part of the URI.
- void **setSchemeSpecificPart** (const std::string &schemeSpecificPart)
Sets the Scheme Specific Part of the URI.
- std::string **getAuthority** () const
Gets the Authority of the URI.
- void **setAuthority** (const std::string &authority)
Sets the Authority of the URI.
- std::string **getUserInfo** () const
Gets the user info part of the URI, e.g.
- void **setUserInfo** (const std::string &userinfo)
Sets the user info part of the URI, e.g.
- std::string **getHost** () const
Gets the Host name part of the URI.
- void **setHost** (const std::string &host)
Sets the Host name part of the URI.
- int **getPort** () const

Gets the port part of the URI.

- void **setPort** (int port)
Sets the port part of the URI.
- std::string **getPath** () const
Gets the Path part of the URI.
- void **setPath** (const std::string &path)
Sets the Path part of the URI.
- std::string **getQuery** () const
Gets the Query part of the URI.
- void **setQuery** (const std::string &query)
Sets the Query part of the URI.
- std::string **getFragment** () const
Gets the Fragment part of the URI.
- void **setFragment** (const std::string &fragment)
Sets the Fragment part of the URI.
- bool **isOpaque** () const
Gets if the URI is Opaque.
- void **setOpaque** (bool opaque)
Sets if the URI is Opaque.
- bool **isAbsolute** () const
Gets if the URI is Absolute.
- void **setAbsolute** (bool absolute)
Sets if the URI is Absolute.
- bool **isServerAuthority** () const
Gets if the URI is a Server Authority.
- void **setServerAuthority** (bool serverAuthority)
Sets if the URI is a Server Authority.
- bool **isValid** () const
Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.
- void **setValid** (bool valid)
Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

6.577.1 Detailed Description

Basic type object that holds data that composes a given URI.

6.577.2 Constructor & Destructor Documentation

6.577.2.1 `decaf::internal::net::URIType::URIType (const std::string & source)` `[inline]`

6.577.2.2 `decaf::internal::net::URIType::URIType ()` `[inline]`

6.577.2.3 `virtual decaf::internal::net::URIType::~~URIType ()` `[inline, virtual]`

6.577.3 Member Function Documentation

6.577.3.1 `std::string decaf::internal::net::URIType::getAuthority () const` `[inline]`

Gets the Authority of the URI.

Returns:

Authority part string.

6.577.3.2 `std::string decaf::internal::net::URIType::getFragment () const` `[inline]`

Gets the Fragment part of the URI.

Returns:

Fragment part string.

6.577.3.3 `std::string decaf::internal::net::URIType::getHost () const` `[inline]`

Gets the Host name part of the URI.

Returns:

Host name part string.

6.577.3.4 `std::string decaf::internal::net::URIType::getPath () const` `[inline]`

Gets the Path part of the URI.

Returns:

Path part string.

6.577.3.5 `int decaf::internal::net::URIType::getPort () const [inline]`

Gets the port part of the URL.

Returns:

port part string, -1 if not set.

6.577.3.6 `std::string decaf::internal::net::URIType::getQuery () const [inline]`

Gets the Query part of the URL.

Returns:

Query part string.

6.577.3.7 `std::string decaf::internal::net::URIType::getScheme () const [inline]`

Gets the Scheme of the URL, e.g. scheme ("http"/"ftp"/...).

Returns:

scheme part string.

6.577.3.8 `std::string decaf::internal::net::URIType::getSchemeSpecificPart () const [inline]`

Gets the Scheme Specific Part of the URL.

Returns:

scheme specific part string.

6.577.3.9 `std::string decaf::internal::net::URIType::getSource () const [inline]`

Gets the source URI string that was parsed to obtain this **URIType** (p.2669) instance and the resulting data,.

Returns:

the source URI string

6.577.3.10 `std::string decaf::internal::net::URIType::getUserInfo () const [inline]`

Gets the user info part of the URL, e.g. user name, as in `http://user:passwd@host:port/`

Returns:

user info part string.

6.577.3.11 `bool decaf::internal::net::URIType::isAbsolute () const [inline]`

Gets if the URI is Absolute.

Returns:

true if Absolute.

6.577.3.12 `bool decaf::internal::net::URIType::isOpaque () const [inline]`

Gets if the URI is Opaque.

Returns:

true if opaque.

6.577.3.13 `bool decaf::internal::net::URIType::isServerAuthority () const [inline]`

Gets if the URI is a Server Authority.

Returns:

true if Server Authority.

6.577.3.14 `bool decaf::internal::net::URIType::isValid () const [inline]`

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Returns:

true if the **URIType** (p. 2669) contains valid data.

6.577.3.15 `void decaf::internal::net::URIType::setAbsolute (bool absolute) [inline]`

Sets if the URI is Absolute.

Parameters:

absolute - true if Absolute.

6.577.3.16 `void decaf::internal::net::URIType::setAuthority (const std::string & authority) [inline]`

Sets the Authority of the URI.

Parameters:

authority Authority part string.

6.577.3.17 `void decaf::internal::net::URIType::setFragment (const std::string & fragment)` [inline]

Sets the Fragment part of the URL.

Parameters:

fragment - Fragment part string.

6.577.3.18 `void decaf::internal::net::URIType::setHost (const std::string & host)` [inline]

Sets the Host name part of the URL.

Parameters:

host - Host name part string.

6.577.3.19 `void decaf::internal::net::URIType::setOpaque (bool opaque)` [inline]

Sets if the URI is Opaque.

Parameters:

opaque true if opaque.

6.577.3.20 `void decaf::internal::net::URIType::setPath (const std::string & path)` [inline]

Sets the Path part of the URL.

Parameters:

path - Path part string.

6.577.3.21 `void decaf::internal::net::URIType::setPort (int port)` [inline]

Sets the port part of the URL.

Parameters:

port - port part string, -1 if not set.

6.577.3.22 `void decaf::internal::net::URIType::setQuery (const std::string & query)` [inline]

Sets the Query part of the URL.

Parameters:

query - Query part string.

6.577.3.23 void decaf::internal::net::URIType::setScheme (const std::string & *scheme*) [inline]

Sets the Scheme of the URI, e.g. scheme ("http"/"ftp"/...).

Parameters:

scheme - scheme part string.

6.577.3.24 void decaf::internal::net::URIType::setSchemeSpecificPart (const std::string & *schemeSpecificPart*) [inline]

Sets the Scheme Specific Part of the URI.

Parameters:

schemeSpecificPart - scheme specific part string.

6.577.3.25 void decaf::internal::net::URIType::setServerAuthority (bool *serverAuthority*) [inline]

Sets if the URI is a Server Authority.

Parameters:

serverAuthority - true if Server Authority.

6.577.3.26 void decaf::internal::net::URIType::setSource (const std::string & *source*) [inline]

Sets the source URI string that was parsed to obtain this **URIType** (p. 2669) instance and the resulting data,.

Parameters:

source - the source URI string

6.577.3.27 void decaf::internal::net::URIType::setUserInfo (const std::string & *userinfo*) [inline]

Sets the user info part of the URI, e.g. user name, as in http://user:passwd@host:port/

Parameters:

userinfo - user info part string.

6.577.3.28 void decaf::internal::net::URIType::setValid (bool *valid*) [inline]

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Parameters:

valid - true if the **URIType** (p. 2669) contains valid data.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/URIType.h`

6.578 decaf::net::URL Class Reference

Class **URL** (p.2677) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

```
#include <src/main/decaf/net/URL.h>
```

Public Member Functions

- **URL** ()
- **URL** (const std::string &url)
- virtual ~**URL** ()

6.578.1 Detailed Description

Class **URL** (p.2677) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web. A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

```
http://www.ksc.nasa.gov/facts/internet/url-primer.html
```

In general, a **URL** (p.2677) can be broken into several parts. The previous example of a **URL** (p.2677) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named www.ksc.nasa.gov. The information on that host machine is named /facts/internet/url-primer.html. The exact meaning of this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p.2677) is called the path component.

A **URL** (p.2677) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

```
http://www.ksc.nasa.gov:80/facts/internet/url-primer.html
```

The syntax of **URL** (p.2677) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p.2638)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports scope_ids. The syntax and usage of scope_ids is described here.

A **URL** (p.2677) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

```
http://www.apache.org/cms/index.html#chapter1
```

This fragment is not technically part of the **URL** (p.2677). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that part of the document that has the tag chapter1 attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p.2677). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p.2677):

```
http://www.apache.org/cms/index.html
```

contained within it the relative **URL** (p. 2677):

FAQ.html

it would be a shorthand for:

`http://www.apache.org/cms/FAQ.html`

The relative **URL** (p. 2677) need not specify all the components of a **URL** (p. 2677). If the protocol, host name, or port number is missing, the value is inherited from the fully specified **URL** (p. 2677). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 2677) class does not itself encode or decode any **URL** (p. 2677) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 2677), and also to decode any escaped fields, that are returned from **URL** (p. 2677). Furthermore, because **URL** (p. 2677) has no knowledge of **URL** (p. 2677) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 2677). For example, the two URLs:

`http://foo.com/hello world/` and `http://foo.com/hello%20world`

would be considered not equal to each other.

Note, the **URI** (p. 2638) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 2638), and to convert between these two classes using `toURI()` and `URI.toURL()` (p. 2648).

The **URLEncoder** (p. 2680) and **URLDecoder** (p. 2679) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

6.578.2 Constructor & Destructor Documentation

6.578.2.1 `decaf::net::URL::URL ()`

6.578.2.2 `decaf::net::URL::URL (const std::string & url)`

6.578.2.3 `virtual decaf::net::URL::~~URL ()` [inline, virtual]

```
#include <src/main/decaf/net/URLDecoder.h>
```

Public Member Functions

- virtual `~URLDecoder ()`

Static Public Member Functions

- static `std::string decode (const std::string &value)`
Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type.

6.579.1 Constructor & Destructor Documentation

6.579.1.1 virtual `decaf::net::URLDecoder::~~URLDecoder ()` [inline, virtual]

6.579.2 Member Function Documentation

6.579.2.1 static `std::string decaf::net::URLDecoder::decode (const std::string &value)` [static]

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type. '+' will be converted to space, '%' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C \$%"

Parameters:

value - string The encoded string.

Returns:

The decoded version as a string.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URLDecoder.h`

6.580 decaf::net::URLEncoder Class Reference

```
#include <src/main/decaf/net/URLEncoder.h>
```

Public Member Functions

- virtual `~URLEncoder()`

Static Public Member Functions

- static `std::string encode(const std::string &value)`

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.

6.580.1 Constructor & Destructor Documentation

6.580.1.1 virtual `decaf::net::URLEncoder::~~URLEncoder()` [inline, virtual]

6.580.2 Member Function Documentation

6.580.2.1 static `std::string decaf::net::URLEncoder::encode(const std::string &value)` [static]

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type. All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '*', '_' are converted into their hexadecimal value prepended by ".

For example: '#' -> 23

In addition, spaces are substituted by '+'

Parameters:

value - the string to be converted

Returns:

the converted string

- `src/main/decaf/net/URLEncoder.h`

6.581 activemq::util::Usage Class Reference

#include <src/main/activemq/util/Usage.h> Inheritance diagram for activemq::util::Usage:

Public Member Functions

- virtual `~Usage ()`
- virtual void `waitForSpace ()=0`
*Waits forever for more space to be returned to this **Usage** (p. 2681) Manager.*
- virtual void `waitForSpace (unsigned int timeout)=0`
*Waits for more space to be returned to this **Usage** (p. 2681) Manager, times out when the given time span in milliseconds elapses.*
- virtual void `enqueueUsage (unsigned long long value)=0`
Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void `increaseUsage (unsigned long long value)=0`
Increases the usage by the value amount.
- virtual void `decreaseUsage (unsigned long long value)=0`
Decreases the usage by the value amount.
- virtual bool `isFull () const =0`
*Returns true if this **Usage** (p. 2681) instance is full, i.e.*

6.581.1 Constructor & Destructor Documentation

6.581.1.1 virtual `activemq::util::Usage::~~Usage ()` [inline, virtual]

6.581.2 Member Function Documentation

6.581.2.1 virtual void `activemq::util::Usage::decreaseUsage (unsigned long long value)` [pure virtual]

Decreases the usage by the value amount.

Parameters:

value Amount of space to return to the pool

Implemented in `activemq::util::MemoryUsage` (p. 1734).

6.581.2.2 virtual void `activemq::util::Usage::enqueueUsage (unsigned long long value)` [pure virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters:

value Amount of usage in bytes to add.

Implemented in **activemq::util::MemoryUsage** (p. 1734).

6.581.2.3 virtual void activemq::util::Usage::increaseUsage (unsigned long long *value*) [pure virtual]

Increases the usage by the value amount.

Parameters:

value Amount of usage to add.

Implemented in **activemq::util::MemoryUsage** (p. 1735).

6.581.2.4 virtual bool activemq::util::Usage::isFull () const [pure virtual]

Returns true if this **Usage** (p. 2681) instance is full, i.e. **Usage** (p. 2681) $\geq 100\%$

Returns:

true if **Usage** (p. 2681) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 1735).

6.581.2.5 virtual void activemq::util::Usage::waitForSpace (unsigned int *timeout*) [pure virtual]

Waits for more space to be returned to this **Usage** (p. 2681) Manager, times out when the given time span in milliseconds elapses.

Parameters:

timeout The time to wait for more space.

Implemented in **activemq::util::MemoryUsage** (p. 1735).

6.581.2.6 virtual void activemq::util::Usage::waitForSpace () [pure virtual]

Waits forever for more space to be returned to this **Usage** (p. 2681) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 1736).

The documentation for this class was generated from the following file:

- src/main/activemq/util/Usage.h

6.582 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

#include <src/main/decaf/io/UTFDataFormatException.h>Inheritance diagram for decaf::io::UTFDataFormatException:

Public Member Functions

- **UTFDataFormatException** () throw ()
Default Constructor.
- **UTFDataFormatException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **UTFDataFormatException** (const UTFDataFormatException &ex) throw ()
Copy Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UTFDataFormatException** (const std::exception *cause) throw ()
Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **UTFDataFormatException * clone** () const
Clones this exception.
- virtual ~**UTFDataFormatException** () throw ()

6.582.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since:

1.0

6.582.2 Constructor & Destructor Documentation

6.582.2.1 decaf::io::UTFDataFormatException::UTFDataFormatException () throw () [inline]

Default Constructor.

6.582.2.2 `decaf::io::UTFDataFormatException::UTFDataFormatException (const lang::Exception & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex the exception to copy

6.582.2.3 `decaf::io::UTFDataFormatException::UTFDataFormatException (const UTFDataFormatException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.582.2.4 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.582.2.5 `decaf::io::UTFDataFormatException::UTFDataFormatException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.582.2.6 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.582.2.7 virtual decaf::io::UTFDataFormatException::~~UTFDataFormatException
() throw () [inline, virtual]

6.582.3 Member Function Documentation

6.582.3.1 virtual UTFDataFormatException* decaf::io::UTFDataFormatException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1479).

The documentation for this class was generated from the following file:

- src/main/decaf/io/UTFDataFormatException.h

6.583 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 2686)).

#include <src/main/decaf/util/UUID.h> Inheritance diagram for decaf::util::UUID:

Public Member Functions

- **UUID** (long long mostSigBits, long long leastSigBits)
*Constructs a new **UUID** (p. 2686) using the specified data.*
- virtual ~**UUID** ()
- virtual int **compareTo** (const **UUID** &value) const
*Compare the given **UUID** (p. 2686) to this one.*
- virtual bool **equals** (const **UUID** &value) const
*Compares this **UUID** (p. 2686) to the one given, returns true if they are equal.*
- virtual bool **operator==** (const **UUID** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **UUID** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual std::string **toString** () const
*Returns a String object representing this **UUID** (p. 2686).*
- virtual long long **getLeastSignificantBits** () const
- virtual long long **getMostSignificantBits** () const
- virtual long long **node** () throw (lang::exceptions::UnsupportedOperationException)
*The node value associated with this **UUID** (p. 2686).*
- virtual long long **timestamp** () throw (lang::exceptions::UnsupportedOperationException)

*Static factory to retrieve a type 3 (name based) **UUID** (p. 2686) based on the specified byte array.*
- static **UUID** fromString (const std::string &name) throw (lang::exceptions::IllegalArgumentException)
*Creates a **UUID** (p. 2686) from the string standard representation as described in the toString() (p. 2691) method.*

6.583.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 2686)). A **UUID** (p. 2686) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 2686) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 2686) is as follows: The most significant long consists of the following unsigned fields:

```
0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000F000 version
0x00000000000000FF time_hi
```

The least significant long consists of the following unsigned fields:

```
0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFFFFFF node
```

The variant field contains a value which identifies the layout of the **UUID** (p. 2686). The bit layout described above is valid only for a **UUID** (p. 2686) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 2686). There are four different basic types of UUIDs: time-based, DCE **security** (p. 107), name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

6.583.2 Constructor & Destructor Documentation

6.583.2.1 decaf::util::UUID::UUID (long long *mostSigBits*, long long *leastSigBits*)

Constructs a new **UUID** (p. 2686) using the specified data. *mostSigBits* is used for the most significant 64 bits of the **UUID** (p. 2686) and *leastSigBits* becomes the least significant 64 bits of the **UUID** (p. 2686).

Parameters:*mostSigBits**leastSigBits***6.583.2.2** `virtual decaf::util::UUID::~~UUID ()` [virtual]**6.583.3 Member Function Documentation****6.583.3.1** `virtual int decaf::util::UUID::clockSequence () throw (lang::exceptions::UnsupportedOperationException)` [virtual]

The clock sequence value associated with this **UUID** (p.2686). The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p.2686). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p.2686).

The clockSequence value is only meaningful in a time-based **UUID** (p.2686), which has version type 1. If this **UUID** (p.2686) is not a time-based **UUID** (p.2686) then this method throws `UnsupportedOperationException`.

Returns:

the clockSequence associated with a V1 **UUID** (p.2686)

Exceptions:*`UnsupportedOperationException`***6.583.3.2** `virtual int decaf::util::UUID::compareTo (const UUID & value) const` [virtual]

Compare the given **UUID** (p.2686) to this one.

Parameters:

value - the **UUID** (p.2686) to compare to

6.583.3.3 `virtual bool decaf::util::UUID::equals (const UUID & value) const` [virtual]

Compares this **UUID** (p.2686) to the one given, returns true if they are equal.

Parameters:

value - the **UUID** (p.2686) to compare to.

Returns:

true if UUIDs are the same.

6.583.3.4 `static UUID decaf::util::UUID::fromString (const std::string & name)
 throw (lang::exceptions::IllegalArgumentException) [static]`

Creates a **UUID** (p. 2686) from the string standard representation as described in the `toString()` (p. 2691) method.

Parameters:

name - a string to be used to construct a **UUID** (p. 2686).

Returns:

type 3 **UUID** (p. 2686)

6.583.3.5 `virtual long long decaf::util::UUID::getLeastSignificantBits () const
 [virtual]`

Returns:

the most significant 64 bits of this UUID's 128 bit value.

6.583.3.6 `virtual long long decaf::util::UUID::getMostSignificantBits () const
 [virtual]`

Returns:

the most significant 64 bits of this UUID's 128 bit value.

6.583.3.7 `static UUID decaf::util::UUID::nameUUIDFromBytes (const char *
 name, std::size_t size) [static]`

Static factory to retrieve a type 3 (name based) **UUID** (p. 2686) based on the specified byte array.

Parameters:

name - a byte array to be used to construct a **UUID** (p. 2686).

size - the size of the byte array, or number of bytes to use.

Returns:

type 3 **UUID** (p. 2686)

6.583.3.8 `static UUID decaf::util::UUID::nameUUIDFromBytes (const std::vector<
 char > & name) [static]`

Static factory to retrieve a type 3 (name based) **UUID** (p. 2686) based on the specified byte array.

Parameters:

name - a byte array to be used to construct a **UUID** (p. 2686).

Returns:

type 3 **UUID** (p. 2686)

6.583.3.9 `virtual long long decaf::util::UUID::node () throw (lang::exceptions::UnsupportedOperationException) [virtual]`

The node value associated with this **UUID** (p. 2686). The 48 bit node value is constructed from the node field of this **UUID** (p. 2686). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 2686) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 2686), which has version type 1. If this **UUID** (p. 2686) is not a time-based **UUID** (p. 2686) then this method throws `UnsupportedOperationException`.

Returns:

the node value of this **UUID** (p. 2686)

Exceptions:

`UnsupportedOperationException`

6.583.3.10 `virtual bool decaf::util::UUID::operator< (const UUID & value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.583.3.11 `virtual bool decaf::util::UUID::operator== (const UUID & value) const [virtual]`

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.583.3.12 `static UUID decaf::util::UUID::randomUUID () [static]`

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 2686). The **UUID** (p. 2686) is generated using a cryptographically strong pseudo random number generator.

Returns:

type 4 **UUID** (p. 2686)

6.583.3.13 `virtual long long decaf::util::UUID::timestamp () throw (lang::exceptions::UnsupportedOperationException) [virtual]`

The timestamp value associated with this **UUID** (p.2686). The 60 bit timestamp value is constructed from the time_low, time_mid, and time_hi fields of this **UUID** (p.2686). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p.2686), which has version type 1. If this **UUID** (p.2686) is not a time-based **UUID** (p.2686) then this method throws `UnsupportedOperationException`.

Returns:

the timestamp associated with a V1 **UUID** (p.2686)

Exceptions:

UnsupportedOperationException

6.583.3.14 `virtual std::string decaf::util::UUID::toString () const [virtual]`

Returns a `String` object representing this **UUID** (p.2686). **UUID**'s are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

Returns:

formatted string for this **UUID** (p.2686)

6.583.3.15 `virtual int decaf::util::UUID::variant () throw (lang::exceptions::UnsupportedOperationException) [virtual]`

The variant number associated with this **UUID** (p.2686). The variant number describes the layout of the **UUID** (p.2686). The variant number has the following meaning:

* 0 Reserved for NCS backward compatibility * 2 The Leach-Salz variant (used by this class) * 6 Reserved, Microsoft Corporation backward compatibility * 7 Reserved for future definition

Returns:

the variant associated with a V1 **UUID** (p.2686)

Exceptions:

UnsupportedOperationException

6.583.3.16 `virtual int decaf::util::UUID::version () throw (lang::exceptions::UnsupportedOperationException) [virtual]`

The version number associated with this **UUID** (p.2686). The version number describes how this **UUID** (p.2686) was generated. The version number has the following meaning:

* 1 Time-based **UUID** (p.2686) * 2 DCE security (p.107) **UUID** (p.2686) * 3 Name-based **UUID** (p.2686) * 4 Randomly generated **UUID** (p.2686)

Returns:

the version associated with a V1 **UUID** (p. 2686)

Exceptions:

UnsupportedOperationException

The documentation for this class was generated from the following file:

- `src/main/decaf/util/UUID.h`

6.584 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal **commands** (p.59) into and out of packets or into and out of streams, Channels and Datagrams.

#include <src/main/activemq/wireformat/WireFormat.h> Inheritance diagram for activemq::wireformat::WireFormat:

Public Member Functions

- virtual **~WireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)=0
throw (**decaf::io::IOException**)
Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)=0
throw (**decaf::io::IOException**)
Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
- virtual void **setVersion** (int version)=0
Set the Version.
- virtual int **getVersion** () const =0
Get the Version.
- virtual bool **hasNegotiator** () const =0
*Returns true if this **WireFormat** (p.2693) has a Negotiator that needs to wrap the Transport that uses it.*
- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport)=0 throw (**decaf::lang::exceptions::UnsupportedOperationException**)
If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

6.584.1 Detailed Description

Provides a mechanism to marshal **commands** (p.59) into and out of packets or into and out of streams, Channels and Datagrams.

Version:

Revision 1.1

6.584.2 Constructor & Destructor Documentation

6.584.2.1 `virtual activemq::wireformat::WireFormat::~~WireFormat () [inline, virtual]`

6.584.3 Member Function Documentation

6.584.3.1 `virtual Pointer<transport::Transport> activemq::wireformat::WireFormat::createNegotiator (const Pointer< transport::Transport > & transport) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters:

transport (p. 67) - the Transport to Wrap the Negotiator around.

Returns:

new instance of a **WireFormatNegotiator** (p. 2721) as a **Pointer<Transport>** (p. 2011).

Exceptions:

UnsupportedOperationException if the **WireFormat** (p. 2693) doesn't have a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1973), and **activemq::wireformat::stomp::StompWireFormat** (p. 2467).

6.584.3.2 `virtual int activemq::wireformat::WireFormat::getVersion () const [pure virtual]`

Get the Version.

Returns:

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1975), and **activemq::wireformat::stomp::StompWireFormat** (p. 2467).

6.584.3.3 `virtual bool activemq::wireformat::WireFormat::hasNegotiator () const [pure virtual]`

Returns true if this **WireFormat** (p. 2693) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 2693) provides a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1975), and **activemq::wireformat::stomp::StompWireFormat** (p. 2467).

6.584.3.4 virtual void activemq::wireformat::WireFormat::marshal (const Pointer< commands::Command > & *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) throw (decaf::io::IOException) [pure virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal

transport (p. 67) The Transport that called this method.

out The output stream to write the command to.

Exceptions:

IOException

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1977), and **activemq::wireformat::stomp::StompWireFormat** (p. 2468).

6.584.3.5 virtual void activemq::wireformat::WireFormat::setVersion (int *version*) [pure virtual]

Set the Version.

Parameters:

version the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1979), and **activemq::wireformat::stomp::StompWireFormat** (p. 2468).

6.584.3.6 virtual Pointer<commands::Command> activemq::wireformat::WireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) throw (decaf::io::IOException) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form. Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport (p. 67) - Pointer to the **transport** (p. 67) that is making this request.

in - the input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException

Implemented in `activemq::wireformat::openwire::OpenWireFormat` (p. 1980), and `activemq::wireformat::stomp::StompWireFormat` (p. 2468).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/WireFormat.h`

6.585 activemq::wireformat::WireFormatFactory Class Reference

The **WireFormatFactory** (p.2697) is the interface that all **WireFormatFactory** (p.2697) classes must extend.

#include <src/main/activemq/wireformat/WireFormatFactory.h> Inheritance diagram for activemq::wireformat::WireFormatFactory:

Public Member Functions

- virtual **~WireFormatFactory** ()
- virtual **Pointer< WireFormat > createWireFormat** (const **decaf::util::Properties** &properties)=0 throw (**decaf::lang::exceptions::IllegalStateException**)
*Creates a new **WireFormat** (p.2693) Object passing it a set of properties from which it can obtain any optional settings.*

6.585.1 Detailed Description

The **WireFormatFactory** (p.2697) is the interface that all **WireFormatFactory** (p.2697) classes must extend. The Factory creates a **WireFormat** (p.2693) Object based on the properties that are set in the passed **Properties** object.

6.585.2 Constructor & Destructor Documentation

6.585.2.1 virtual **activemq::wireformat::WireFormatFactory::~~WireFormatFactory** () [inline, virtual]

6.585.3 Member Function Documentation

6.585.3.1 virtual **Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat** (const **decaf::util::Properties** & *properties*) throw (**decaf::lang::exceptions::IllegalStateException**) [pure virtual]

Creates a new **WireFormat** (p.2693) Object passing it a set of properties from which it can obtain any optional settings.

Parameters:

properties - the **Properties** for this **WireFormat** (p.2693)

Returns:

Pointer to a new instance of a **WireFormat** (p.2693) object.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p.1982), and **activemq::wireformat::stomp::StompWireFormatFactory** (p.2470).

The documentation for this class was generated from the following file:

6.586 activemq::commands::WireFormatInfo Class Reference

#include <src/main/activemq/commands/WireFormatInfo.h> Inheritance diagram for activemq::commands::WireFormatInfo:

Public Member Functions

- **WireFormatInfo** ()
- virtual **~WireFormatInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DataStructure** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual bool **isMarshalAware** () const
Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (**exceptions::ActiveMQException**)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- int **getVersion** () const
Get the current Wireformat Version.
- void **setVersion** (int version)
Set the current Wireformat Version.
- long long **getMaxInactivityDuration** () const
Returns the currently configured Max Inactivity duration.
- void **setMaxInactivityDuration** (long long maxInactivityDuration)
Sets the Max inactivity duration value.

- long long **getMaxInactivityDurationInitialDelay** () const
Returns the currently configured Max Inactivity Initial Delay duration.
- void **setMaxInactivityDurationInitialDelay** (long long maxInactivityDurationInitialDelay)
Sets the Max inactivity initial delay duration value.
- bool **isStackTraceEnabled** () const
Checks if the stackTraceEnabled flag is on.
- void **setStackTraceEnabled** (bool stackTraceEnabled)
Sets if the stackTraceEnabled flag is on.
- bool **isTcpNoDelayEnabled** () const
Checks if the tcpNoDelayEnabled flag is on.
- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)
Sets if the tcpNoDelayEnabled flag is on.
- bool **isCacheEnabled** () const
Checks if the cacheEnabled flag is on.
- void **setCacheEnabled** (bool cacheEnabled)
Sets if the cacheEnabled flag is on.
- int **getCacheSize** () const
Gets the Cache Size setting.
- void **setCacheSize** (int value)
Sets the Cache Size setting.
- bool **isTightEncodingEnabled** () const
Checks if the tightEncodingEnabled flag is on.
- void **setTightEncodingEnabled** (bool tightEncodingEnabled)
Sets if the tightEncodingEnabled flag is on.
- bool **isSizePrefixDisabled** () const
Checks if the sizePrefixDisabled flag is on.
- void **setSizePrefixDisabled** (bool sizePrefixDisabled)
Sets if the sizePrefixDisabled flag is on.
- const std::vector< unsigned char > &**getMagic** () const
Get the Magic field.
- void **setMagic** (const std::vector< unsigned char > &magic)
Sets the value of the magic field.

- `const std::vector< unsigned char > & getMarshallledProperties () const`
Get the `marshallledProperties` field.
- `void setMarshallledProperties (const std::vector< unsigned char > &marshallledProperties)`
Sets the value of the `marshallledProperties` field.
- `virtual const util::PrimitiveMap & getProperties () const`
*Gets the Properties for this **Command** (p. 879).*
- `virtual util::PrimitiveMap & getProperties ()`
*Gets the Properties for this **Command** (p. 879).*
- `virtual void setProperties (const util::PrimitiveMap &map)`
*Sets the Properties for this **Command** (p. 879).*
- `bool isValid () const`
*Determines if we think this is a Valid **WireFormatInfo** (p. 2699) command.*
- `virtual bool isWireFormatInfo () const`
- `virtual void beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)`
Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.
- `virtual void afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)`
Called after unmarshaling is started to cleanup the object being unmarshaled.

Static Public Attributes

- `static const unsigned char ID_WIREFORMATINFO = 1`

6.586.1 Constructor & Destructor Documentation

6.586.1.1 `activemq::commands::WireFormatInfo::WireFormatInfo ()`

6.586.1.2 `virtual activemq::commands::WireFormatInfo::~~WireFormatInfo ()`
[virtual]

6.586.2 Member Function Documentation

6.586.2.1 `virtual void activemq::commands::WireFormatInfo::afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)` [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat - the `wireformat` (p. 74) object to control unmarshaling

Reimplemented from `activemq::commands::BaseDataStructure` (p. 558).

6.586.2.2 `virtual void activemq::commands::WireFormatInfo::beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)` [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.

Parameters:

wireFormat - the wire formatting controller

Reimplemented from `activemq::commands::BaseDataStructure` (p. 558).

6.586.2.3 `virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.586.2.4 `virtual void activemq::commands::WireFormatInfo::copyDataStructure (const DataStructure *src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.586.2.5 `virtual bool activemq::commands::WireFormatInfo::equals (const DataStructure *value) const` [virtual]

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.586.2.6 int activemq::commands::WireFormatInfo::getCacheSize () const

Gets the Cache Size setting.

Returns:

currently set cache size.

6.586.2.7 virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

6.586.2.8 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic () const [inline]

Get the Magic field.

Returns:

const reference to a std::vector<char>

6.586.2.9 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshaledProperties () const [inline]

Get the marshalledProperties field.

Returns:

const reference to a std::vector<char>

6.586.2.10 long long activemq::commands::WireFormatInfo::getMaxInactivityDuration () const

Returns the currently configured Max Inactivity duration.

Returns:

the set inactivity duration value.

6.586.2.11 `long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitialDelay () const`

Returns the currently configured Max Inactivity Initial Delay duration.

Returns:

the set inactivity duration initial delay value.

6.586.2.12 `virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () [inline, virtual]`

Gets the Properties for this **Command** (p. 879).

Returns:

the Properties object for this **Command** (p. 879).

6.586.2.13 `virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () const [inline, virtual]`

Gets the Properties for this **Command** (p. 879).

Returns:

the Properties object for this **Command** (p. 879).

6.586.2.14 `int activemq::commands::WireFormatInfo::getVersion () const [inline]`

Get the current Wireformat Version.

Returns:

int that identifies the version

6.586.2.15 `bool activemq::commands::WireFormatInfo::isCacheEnabled () const`

Checks if the cacheEnabled flag is on.

Returns:

true if the flag is on.

6.586.2.16 `virtual bool activemq::commands::WireFormatInfo::isMarshalAware () const [inline, virtual]`

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns:

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 559).

6.586.2.17 bool activemq::commands::WireFormatInfo::isSizePrefixDisabled () const

Checks if the sizePrefixDisabled flag is on.

Returns:

true if the flag is on.

6.586.2.18 bool activemq::commands::WireFormatInfo::isStackTraceEnabled () const

Checks if the stackTraceEnabled flag is on.

Returns:

true if the flag is on.

6.586.2.19 bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled () const

Checks if the tcpNoDelayEnabled flag is on.

Returns:

true if the flag is on.

6.586.2.20 bool activemq::commands::WireFormatInfo::isTightEncodingEnabled () const

Checks if the tightEncodingEnabled flag is on.

Returns:

true if the flag is on.

6.586.2.21 bool activemq::commands::WireFormatInfo::isValid () const

Determines if we think this is a Valid **WireFormatInfo** (p. 2699) command.

Returns:

true if its valid.

6.586.2.22 `virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo ()`
`const [inline, virtual]`

Returns:

answers true to the isWireFormatInfo query

Reimplemented from `activemq::commands::BaseCommand` (p. 512).

6.586.2.23 `void activemq::commands::WireFormatInfo::setCacheEnabled (bool`
`cacheEnabled)`

Sets if the cacheEnabled flag is on.

Parameters:

cacheEnabled - true to turn flag is on

6.586.2.24 `void activemq::commands::WireFormatInfo::setCacheSize (int value)`

Sets the Cache Size setting.

Parameters:

value - value to set to the cache size.

6.586.2.25 `void activemq::commands::WireFormatInfo::setMagic (const`
`std::vector< unsigned char > & magic) [inline]`

Sets the value of the magic field.

Parameters:

magic - const std::vector<char>

6.586.2.26 `void activemq::commands::WireFormatInfo::setMarshaledProperties`
`(const std::vector< unsigned char > & marshalledProperties) [inline]`

Sets the value of the marshalledProperties field.

Parameters:

marshalledProperties The Byte Array vector that contains the marshaled form of the Message (p. 1737) properties, this is the data sent over the wire.

6.586.2.27 `void activemq::commands::WireFormatInfo::setMaxInactivityDuration`
`(long long maxInactivityDuration)`

Sets the Max inactivity duration value.

Parameters:

maxInactivityDuration - max time a client can be inactive.

6.586.2.28 void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitialDelay (long long *maxInactivityDurationInitialDelay*)

Sets the Max inactivity initial delay duration value.

Parameters:

maxInactivityDurationInitialDelay - time before the inactivity delay is checked.

6.586.2.29 virtual void activemq::commands::WireFormatInfo::setProperties (const util::PrimitiveMap & *map*) [inline, virtual]

Sets the Properties for this **Command** (p. 879).

Parameters:

map - PrimitiveMap to copy

6.586.2.30 void activemq::commands::WireFormatInfo::setSizePrefixDisabled (bool *sizePrefixDisabled*)

Sets if the sizePrefixDisabled flag is on.

Parameters:

sizePrefixDisabled - true to turn flag is on

6.586.2.31 void activemq::commands::WireFormatInfo::setStackTraceEnabled (bool *stackTraceEnabled*)

Sets if the stackTraceEnabled flag is on.

Parameters:

stackTraceEnabled - ture to turn flag is on

6.586.2.32 void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*)

Sets if the tcpNoDelayEnabled flag is on.

Parameters:

tcpNoDelayEnabled - ture to turn flag is on

6.586.2.33 void activemq::commands::WireFormatInfo::setTightEncodingEnabled (bool *tightEncodingEnabled*)

Sets if the tightEncodingEnabled flag is on.

Parameters:

tightEncodingEnabled - true to turn flag is on

6.586.2.34 `void activemq::commands::WireFormatInfo::setVersion (int version)`
[inline]

Set the current Wireformat Version.

Parameters:

version - int that identifies the version

6.586.2.35 `virtual std::string activemq::commands::WireFormatInfo::toString ()`
`const` [virtual]

Returns a string containing the information for this **DataSet** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 512).

6.586.2.36 `virtual decaf::lang::Pointer<commands::Command>`
`activemq::commands::WireFormatInfo::visit (ac-`
`tivemq::state::CommandVisitor * visitor) throw (`
`exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p.883).

6.586.3 Field Documentation

6.586.3.1 `const unsigned char activemq::commands::WireFormatInfo::ID _-`
`WIREFORMATINFO = 1` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/WireFormatInfo.h`

6.587 activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2709).

#include <src/main/activemq/wireformat/openwire/marshal/v3/WireFormatInfoMarshaller.h>Inheritance diagram for activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller:

Public Member Functions

- **WireFormatInfoMarshaller** ()
- virtual **~WireFormatInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.587.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2709). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.587.2 Constructor & Destructor Documentation

6.587.2.1 `activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::WireFormatInfoMarshaller()` [inline]

6.587.2.2 `virtual activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller()` [inline, virtual]

6.587.3 Member Function Documentation

6.587.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.587.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.587.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.587.3.4 virtual void `activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.587.3.5 virtual int `activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.587.3.6 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.587.3.7 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.588.3 Member Function Documentation

6.588.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.588.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.588.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.588.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.588.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.588.3.6 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.588.3.7 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.589.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2717). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.589.2 Constructor & Destructor Documentation

6.589.2.1 `activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::WireFormatInfoMarshaller()` [inline]

6.589.2.2 `virtual activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller()` [inline, virtual]

6.589.3 Member Function Documentation

6.589.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.589.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.589.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.589.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.589.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.589.3.6 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.589.3.7 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.590.1 Detailed Description

Defines a **WireFormatNegotiator** (p. 2721) which allows a **WireFormat** (p. 2693) to.

6.590.2 Constructor & Destructor Documentation

6.590.2.1 activemq::wireformat::WireFormatNegotiator::WireFormatNegotiator (const **Pointer**< **transport::Transport** > & *next*) [inline]

Constructor.

Parameters:

next - the next **Transport** in the chain

6.590.2.2 virtual activemq::wireformat::WireFormatNegotiator::~~WireFormatNegotiator () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatNegotiator.h**

6.591 activemq::wireformat::WireFormatRegistry Class Reference

Registry of all **WireFormat** (p. 2693) Factories that are available to the client at runtime.

```
#include <src/main/activemq/wireformat/WireFormatRegistry.h>
```

Public Member Functions

- virtual **~WireFormatRegistry** ()
- **WireFormatFactory** * **findFactory** (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)

*Gets a Registered **WireFormatFactory** (p. 2697) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **WireFormatFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

*Registers a new **WireFormatFactory** (p. 2697) with this Registry.*

- void **unregisterFactory** (const std::string &name)

Unregisters the Factory with the given name and deletes that instance of the Factory.

- std::vector< std::string > **getWireFormatNames** () const

Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Static Public Member Functions

- static **WireFormatRegistry** & **getInstance** ()

*Gets the single instance of the **WireFormatRegistry** (p. 2722).*

6.591.1 Detailed Description

Registry of all **WireFormat** (p. 2693) Factories that are available to the client at runtime. New WireFormat's must have a factory registered here before a connection attempt is made.

Since:

3.0

6.591.2 Constructor & Destructor Documentation

6.591.2.1 virtual
activemq::wireformat::WireFormatRegistry::~~WireFormatRegistry ()
[virtual]

6.591.3 Member Function Documentation

6.591.3.1 WireFormatFactory* ac-
tivismq::wireformat::WireFormatRegistry::findFactory (const std::string
& *name*) const throw (decaf::lang::exceptions::NoSuchElementException
)

Gets a Registered **WireFormatFactory** (p. 2697) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters:

name The name of the Factory to find in the Registry.

Returns:

the Factory registered under the given name.

Exceptions:

NoSuchElementException if no factory is registered with that name.

6.591.3.2 static WireFormatRegistry& ac-
tivismq::wireformat::WireFormatRegistry::getInstance ()
[static]

Gets the single instance of the **WireFormatRegistry** (p. 2722).

Returns:

reference to the single instance of this Registry

6.591.3.3 std::vector<std::string> ac-
tivismq::wireformat::WireFormatRegistry::getWireFormatNames ()
const

Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Returns:

stl vector of strings with all the **WireFormat** (p. 2693) names registered.

6.591.3.4 `void activemq::wireformat::WireFormatRegistry::registerFactory`
 `(const std::string & name, WireFormatFactory * factory)`
 `throw (decaf::lang::exceptions::IllegalArgumentException,`
 `decaf::lang::exceptions::NullPointerException)`

Registers a new **WireFormatFactory** (p. 2697) with this Registry. If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters:

name The name of the new Factory to register.
 factory The new Factory to add to the Registry.

Exceptions:

IllegalArgumentException if name is the empty string.
 NullPointerException if the Factory is Null.

6.591.3.5 `void activemq::wireformat::WireFormatRegistry::unregisterFactory`
 `(const std::string & name)`

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters:

name Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/WireFormatRegistry.h`

6.592 decaf::io::Writer Class Reference

```
#include <src/main/decaf/io/Writer.h>
```

Public Member Functions

- virtual `~Writer ()`
- virtual void `setOutputStream (OutputStream *os)=0`
Sets the target output stream.
- virtual `OutputStream * getOutputStream ()=0`
Gets the target output stream.
- virtual void `write (const unsigned char *buffer, std::size_t count)=0` throw (`IOException`, `lang::exceptions::NullPointerException`)
Writes a byte array to the output stream.
- virtual void `writeByte (unsigned char v)=0` throw (`IOException`)
Writes a byte to the output stream.

6.592.1 Constructor & Destructor Documentation

6.592.1.1 virtual `decaf::io::Writer::~~Writer ()` [inline, virtual]

6.592.2 Member Function Documentation

6.592.2.1 virtual `OutputStream* decaf::io::Writer::getOutputStream ()` [pure virtual]

Gets the target output stream.

Returns:

the output stream currently being used

6.592.2.2 virtual void `decaf::io::Writer::setOutputStream (OutputStream * os)` [pure virtual]

Sets the target output stream.

Parameters:

os The provided OutputStream to use to write to.

6.592.2.3 virtual void `decaf::io::Writer::write (const unsigned char * buffer, std::size_t count)` throw (`IOException`, `lang::exceptions::NullPointerException`) [pure virtual]

Writes a byte array to the output stream.

Parameters:

buffer a byte array

count the number of bytes in the array to write.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

6.592.2.4 `virtual void decaf::io::Writer::writeByte (unsigned char v) throw (IOException)` [pure virtual]

Writes a byte to the output stream.

Parameters:

v The value to be written.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

- virtual void `getTBSCertificate (std::vector< unsigned char > &output)` const =0 throw (CertificateEncodingException)
- virtual int `getVersion ()` const =0

6.594.1 Detailed Description

Base interface for all identity certificates.

6.594.2 Constructor & Destructor Documentation

- 6.594.2.1 virtual decaf::security::cert::X509Certificate::~X509Certificate ()
[inline, virtual]

6.594.3 Member Function Documentation

- 6.594.3.1 virtual void decaf::security::cert::X509Certificate::checkValidity (const decaf::util::Date & *date*) const throw (CertificateExpiredException, CertificateNotYetValidException) [pure virtual]

Implemented in decaf::security_provider::unix::openssl::OpenSSLX509Certificate (p. 1965).

6.594.3.2 `virtual void decaf::security::cert::X509Certificate::checkValidity () const
throw (CertificateExpiredException, CertificateNotYetValidException)
[pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1965).

6.594.3.3 `virtual int decaf::security::cert::X509Certificate::getBasicConstraints ()
const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1966).

6.594.3.4 `virtual void decaf::security::cert::X509Certificate::getIssuerUniqueID
(std::vector< bool > & output) const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1966).

6.594.3.5 `virtual const X500Principal* de-
caf::security::cert::X509Certificate::getIssuerX500Principal
() const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1966).

6.594.3.6 `virtual void decaf::security::cert::X509Certificate::getKeyUsage
(std::vector< unsigned char > & output) const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1966).

6.594.3.7 `virtual Date decaf::security::cert::X509Certificate::getNotAfter () const
[pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1966).

6.594.3.8 `virtual Date decaf::security::cert::X509Certificate::getNotBefore () const
[pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1966).

6.594.3.9 `virtual std::string decaf::security::cert::X509Certificate::getSigAlgName
() const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1967).

6.594.3.10 `virtual std::string decaf::security::cert::X509Certificate::getSigAlgOID
() const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1967).

6.594.3.11 `virtual void decaf::security::cert::X509Certificate::getSigAlgParams
(std::vector< unsigned char > & output) const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1967).

6.594.3.12 `virtual void decaf::security::cert::X509Certificate::getSignature
(std::vector< unsigned char > & output) const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1967).

6.594.3.13 `virtual void decaf::security::cert::X509Certificate::getSubjectUniqueID
(std::vector< bool > & output) const [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1968).

6.594.3.14 `virtual const X500Principal* de-
caf::security::cert::X509Certificate::getSubjectX500Principal () const
[pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1968).

6.594.3.15 `virtual void decaf::security::cert::X509Certificate::getTBSCertificate
(std::vector< unsigned char > & output) const throw (
CertificateEncodingException) [pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1968).

6.594.3.16 `virtual int decaf::security::cert::X509Certificate::getVersion () const
[pure virtual]`

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate`
(p. 1968).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/cert/X509Certificate.h`

6.595 activemq::commands::XATransactionId Class Reference

#include <src/main/activemq/commands/XATransactionId.h> Inheritance diagram for activemq::commands::XATransactionId:

Public Types

- typedef decaf::lang::PointerComparator< XATransactionId > COMPARATOR

Public Member Functions

- XATransactionId ()
- XATransactionId (const XATransactionId &other)
- virtual ~XATransactionId ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual XATransactionId * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const DataStructure *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
Returns a string containing the information for this DataStructure (p. 1174) such as its type and value of its elements.
- virtual bool **equals** (const DataStructure *value) const
Compares the DataStructure (p. 1174) passed in to this one, and returns if they are equivalent.
- virtual int **getFormatId** () const
- virtual void **setFormatId** (int formatId)
- virtual const std::vector< unsigned char > & **getGlobalTransactionId** () const
- virtual std::vector< unsigned char > & **getGlobalTransactionId** ()
- virtual void **setGlobalTransactionId** (const std::vector< unsigned char > &globalTransactionId)
- virtual const std::vector< unsigned char > & **getBranchQualifier** () const
- virtual std::vector< unsigned char > & **getBranchQualifier** ()
- virtual void **setBranchQualifier** (const std::vector< unsigned char > &branchQualifier)
- virtual int **compareTo** (const XATransactionId &value) const
- virtual bool **equals** (const XATransactionId &value) const
- virtual bool **operator==** (const XATransactionId &value) const
- virtual bool **operator<** (const XATransactionId &value) const
- XATransactionId & **operator=** (const XATransactionId &other)

Static Public Attributes

- static const unsigned char **ID_XATRANSACTIONID** = 112

Protected Attributes

- int **formatId**
- std::vector< unsigned char > **globalTransactionId**
- std::vector< unsigned char > **branchQualifier**

6.595.1 Member Typedef Documentation

- 6.595.1.1** `typedef decaf::lang::PointerComparator<XATransactionId>
activemq::commands::XATransactionId::COMPARATOR`

Reimplemented from `activemq::commands::TransactionId` (p. 2573).

6.595.2 Constructor & Destructor Documentation

- 6.595.2.1** `activemq::commands::XATransactionId::XATransactionId ()`
- 6.595.2.2** `activemq::commands::XATransactionId::XATransactionId (const
XATransactionId & other)`
- 6.595.2.3** `virtual activemq::commands::XATransactionId::~~XATransactionId ()
[virtual]`

6.595.3 Member Function Documentation

- 6.595.3.1** `virtual XATransactionId* ac-
tivemq::commands::XATransactionId::cloneDataStructure
(const) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

- 6.595.3.2** `virtual int activemq::commands::XATransactionId::compareTo (const
XATransactionId & value) const [virtual]`

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

- 6.595.3.3** `virtual void activemq::commands::XATransactionId::copyDataStructure
(const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

6.595.3.4 `virtual bool activemq::commands::XATransactionId::equals (const XATransactionId & value) const` [virtual]

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

6.595.3.5 `virtual bool activemq::commands::XATransactionId::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.595.3.6 `virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier ()` [virtual]

6.595.3.7 `virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () const` [virtual]

6.595.3.8 `virtual unsigned char activemq::commands::XATransactionId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.595.3.9 `virtual int activemq::commands::XATransactionId::getFormatId () const` [virtual]

6.595.3.10 `virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId ()` [virtual]

6.595.3.11 `virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId () const` [virtual]

6.595.3.12 `virtual bool activemq::commands::XATransactionId::operator< (const XATransactionId & value) const` [virtual]

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.595.3.13 `XATransactionId& activemq::commands::XATransactionId::operator= (const XATransactionId & other)`

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.595.3.14 `virtual bool activemq::commands::XATransactionId::operator== (const XATransactionId & value) const` [virtual]

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.595.3.15 `virtual void activemq::commands::XATransactionId::setBranchQualifier (const std::vector< unsigned char > & branchQualifier)` [virtual]

6.595.3.16 `virtual void activemq::commands::XATransactionId::setFormatId (int formatId)` [virtual]

6.595.3.17 `virtual void activemq::commands::XATransactionId::setGlobalTransactionId (const std::vector< unsigned char > & globalTransactionId)` [virtual]

6.595.3.18 `virtual std::string activemq::commands::XATransactionId::toString () const` [virtual]

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.595.4 Field Documentation

- 6.595.4.1 `std::vector<unsigned char> activemq::commands::XATransactionId::branchQualifier` [protected]
- 6.595.4.2 `int activemq::commands::XATransactionId::formatId` [protected]
- 6.595.4.3 `std::vector<unsigned char> activemq::commands::XATransactionId::globalTransactionId` [protected]
- 6.595.4.4 `const unsigned char activemq::commands::XATransactionId::ID_XATRANSACTIONID = 112` [static]

The documentation for this class was generated from the following file:

6.596 activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2736).

#include <src/main/activemq/wireformat/openwire/marshal/v1/XATransactionIdMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller:

Public Member Functions

- **XATransactionIdMarshaller** ()
- virtual **~XATransactionIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.596.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2736). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.596.2 Constructor & Destructor Documentation

6.596.2.1 `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::XATransactionIdMarshaller()` [inline]

6.596.2.2 `virtual activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::~~XATransactionIdMarshaller()` [inline, virtual]

6.596.3 Member Function Documentation

6.596.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.596.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.596.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 2578).

6.596.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 2578).

6.596.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 2579).

6.596.3.6 virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 2579).

6.596.3.7 virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 2580).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.597.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2740). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.597.2 Constructor & Destructor Documentation

6.597.2.1 `activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::XATransactionIdMarshaller()` [inline]

6.597.2.2 `virtual activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::~~XATransactionIdMarshaller()` [inline, virtual]

6.597.3 Member Function Documentation

6.597.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.597.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.597.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 2582).

6.597.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 2582).

6.597.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 2583).

6.597.3.6 virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 2583).

6.597.3.7 virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 2584).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.598.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2744). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.598.2 Constructor & Destructor Documentation

6.598.2.1 `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::XATransactionIdMarshaller()` [inline]

6.598.2.2 `virtual activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::~~XATransactionIdMarshaller()` [inline, virtual]

6.598.3 Member Function Documentation

6.598.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.598.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.598.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 2586).

6.598.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 2586).

6.598.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 2587).

6.598.3.6 virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 2587).

6.598.3.7 virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 2588).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/XATransactionIdMarshaller.h

Chapter 7

File Documentation

7.1 src/main/activemq/cmsutil/CachedConsumer.h File Reference

```
#include <cms/MessageConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::CachedConsumer**
A cached message consumer contained within a pooled session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.2 src/main/activemq/cmsutil/CachedProducer.h File Reference

```
#include <cms/MessageProducer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::CachedProducer**
A cached message producer contained within a pooled session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.3 src/main/activemq/cmsutil/CmsAccessor.h File Reference

```
#include <cms/ConnectionFactory.h>
#include <activemq/cmsutil/ResourceLifecycleManager.h>
#include <activemq/util/Config.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
```

Data Structures

- class **activemq::cmsutil::CmsAccessor**

*Base class for **activemq.cmsutil.CmsTemplate** (p. 858) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 978) to operate on.*

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.4 src/main/activemq/cmsutil/CmsDestinationAccessor.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsAccessor.h>
#include <activemq/cmsutil/DynamicDestinationResolver.h>
```

Data Structures

- class **activemq::cmsutil::CmsDestinationAccessor**
Extends the `CmsAccessor` (p. 843) to add support for resolving destination names.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.5 src/main/activemq/cmsutil/CmsTemplate.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsDestinationAccessor.h>
#include <activemq/cmsutil/SessionCallback.h>
#include <activemq/cmsutil/ProducerCallback.h>
#include <activemq/cmsutil/SessionPool.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <cms/ConnectionFactory.h>
#include <cms/DeliveryMode.h>
#include <string>
```

Data Structures

- class **activemq::cmsutil::CmsTemplate**
CmsTemplate (p. 858) simplifies performing synchronous CMS operations.
- class **activemq::cmsutil::CmsTemplate::ProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::SendExecutor**
- class **activemq::cmsutil::CmsTemplate::ReceiveExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveReceiveExecutor**

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.6 src/main/activemq/cmsutil/DestinationResolver.h File Reference

```
#include <cms/Session.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::DestinationResolver**
*Resolves a CMS destination name to a **Destination**.*

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.7 src/main/activemq/cmsutil/DynamicDestinationResolver.h File Reference

```
#include <activemq/cmsutil/DestinationResolver.h>
#include <cms/Session.h>
#include <decaf/util/StlMap.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::DynamicDestinationResolver**
*Resolves a CMS destination name to a *Destination*.*
- class **activemq::cmsutil::DynamicDestinationResolver::SessionResolver**
Manages maps of names to topics and queues for a single session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.8 src/main/activemq/cmsutil/MessageCreator.h File Reference

```
#include <cms/Session.h>
#include <cms/Message.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::MessageCreator**
Creates the user-defined message to be sent by the `CmsTemplate` (p. 858).

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.9 src/main/activemq/cmsutil/PooledSession.h File Reference

```
#include <cms/Session.h>
#include <decaf/util/STLMap.h>
#include <activemq/cmsutil/CachedProducer.h>
#include <activemq/cmsutil/CachedConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::PooledSession**
A pooled session object that wraps around a delegate session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.10 src/main/activemq/cmsutil/ProducerCallback.h File Reference

```
#include <cms/Session.h>
#include <cms/MessageProducer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::ProducerCallback**
Callback for sending a message to a CMS destination.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.11 src/main/activemq/cmsutil/ResourceLifecycleManager.h File Reference

```
#include <cms/Connection.h>
#include <cms/Session.h>
#include <cms/Destination.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::ResourceLifecycleManager**
Manages the lifecycle of a set of CMS resources.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.12 src/main/activemq/cmsutil/SessionCallback.h File Reference

```
#include <cms/Session.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::SessionCallback**
Callback for executing any number of operations on a provided CMS Session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.13 src/main/activemq/cmsutil/SessionPool.h File Reference

```
#include <activemq/cmsutil/PooledSession.h>
#include <decaf/util/concurrent/Mutex.h>
#include <cms/Connection.h>
#include <list>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::SessionPool**
A pool of CMS sessions from the same connection and with the same acknowledge mode.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.14 src/main/activemq/commands/ActiveMQBlobMessage.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/commands/ActiveMQMessageTemplate.h>
#include <cms/Message.h>
#include <string>
#include <memory>
```

Data Structures

Defines

- `#define AMQ_CATCH_RETHROW(type)`
Macro for catching and re-throwing an exception of a given type.
- `#define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`
Macro for catching an exception of one type and then re-throwing as another type.
- `#define AMQ_CATCHALL_THROW(type)`
A catch-all that throws a known exception.
- `#define AMQ_CATCHALL_NOTHROW()`
A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- `#define AMQ_CATCH_NOTHROW(type)`
Macro for catching and re-throwing an exception of a given type.
- `#define AMQ_CATCH_ALL_THROW_CMSEXCEPTION()`
Macro for catching an exception of one type and then re-throwing as a Basic CMSEException, good for cases where the method isn't specific about what CMS Exceptions are thrown, bad if you need to throw an exception of MessageNotReadableException for instance.

7.99.1 Define Documentation

7.99.1.1 `#define AMQ_CATCH_ALL_THROW_CMSEXCEPTION()`

Value:

```
catch( cms::CMSEException& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
} catch( activemq::exceptions::ActiveMQException& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex.convertToCMSEException(); \
} catch( decaf::lang::Exception& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    activemq::exceptions::ActiveMQException amqEx( ex ); \
    throw amqEx.convertToCMSEException(); \
} catch( std::exception& ex ){ \
    throw cms::CMSEException( ex.what(), NULL ); \
} catch(...) { \
    throw cms::CMSEException( "Caught Unknown Exception", NULL ); \
}
```

Macro for catching an exception of one type and then re-throwing as a Basic CMSEException, good for cases where the method isn't specific about what CMS Exceptions are thrown, bad if you need to throw an exception of MessageNotReadableException for instance.

Referenced by `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::acknowledge()`, `activemq::commands::ActiveMQTempTopic::destroy()`, `activemq::commands::ActiveMQTempQueue::destroy()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getBooleanProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getByteProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getDoubleProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getFloatProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getIntProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getLongProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getShortProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getStringProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setBooleanProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setByteProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setDoubleProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setFloatProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setIntProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setLongProperty()`, `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setShortProperty()`, and `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setStringProperty()`.

7.99.1.2 `#define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`

Value:

```
catch( sourceType& ex ){ \
    targetType target( ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then re-throwing as another type.

Parameters:

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.99.1.3 `#define AMQ_CATCH_NOTHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and re-throwing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. `ActiveMQException`).

7.99.1.4 #define AMQ_CATCH_RETHROW(type)

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and re-throwing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. ActiveMQException).

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.99.1.5 #define AMQ_CATCHALL_NOTHROW()

Value:

```
catch( ... ){ \
    activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
    "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.99.1.6 #define AMQ_CATCHALL_THROW(type)

Value:

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
    "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters:

type the type of exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.100 src/main/decaf/lang/exceptions/ExceptionDefines.h File Reference

Defines

- `#define DECAF_CATCH_RETHROW(type)`
Macro for catching and rethrowing an exception of a given type.
- `#define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`
Macro for catching an exception of one type and then rethrowing as another type.
- `#define DECAF_CATCHALL_THROW(type)`
A catch-all that throws a known exception.
- `#define DECAF_CATCHALL_NOTHROW()`
A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- `#define DECAF_CATCH_NOTHROW(type)`
Macro for catching and rethrowing an exception of a given type.

7.100.1 Define Documentation

7.100.1.1 `#define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`

Value:

```
catch( sourceType& ex ){ \
    targetType target( &ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then rethrowing as another type.

Parameters:

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

7.100.1.2 `#define DECAF_CATCH_NOTHROW(type)`

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. `Exception`).

Referenced by `decaf::io::FilterInputStream::~~FilterInputStream()`, `decaf::io::FilterOutputStream::~~FilterOutputStream()`, and `decaf::util::logging::StreamHandler::~~StreamHandler()`.

7.100.1.3 #define DECAF_CATCH_RETHROW(type)**Value:**

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. `Exception`).

Referenced by `decaf::io::FilterInputStream::available()`, `decaf::io::FilterOutputStream::close()`, `decaf::io::FilterInputStream::close()`, `decaf::io::FilterOutputStream::flush()`, `decaf::util::concurrent::Lock::lock()`, `decaf::util::concurrent::Lock::Lock()`, `decaf::util::logging::StreamHandler::publish()`, `decaf::io::FilterInputStream::read()`, `decaf::io::FilterInputStream::reset()`, `decaf::io::FilterInputStream::skip()`, `decaf::util::concurrent::Lock::unlock()`, `decaf::io::FilterOutputStream::write()`, and `decaf::util::concurrent::Lock::~~Lock()`.

7.100.1.4 #define DECAF_CATCHALL_NOTHROW()**Value:**

```
catch( ... ){ \
    lang::Exception ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

Referenced by `decaf::io::FilterInputStream::mark()`, `decaf::io::FilterInputStream::markSupported()`, `decaf::io::FilterInputStream::~~FilterInputStream()`, `decaf::io::FilterOutputStream::~~FilterOutputStream()`, and `decaf::util::logging::StreamHandler::~~StreamHandler()`.

7.100.1.5 #define DECAF_CATCHALL_THROW(type)**Value:**

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters:

type the type of exception to be thrown.

Referenced by `decaf::io::FilterInputStream::available()`, `decaf::io::FilterOutputStream::close()`,
`decaf::io::FilterInputStream::close()`, `decaf::io::FilterOutputStream::flush()`, `de-`
`caf::util::concurrent::Lock::lock()`, `decaf::util::concurrent::Lock::Lock()`, `de-`
`caf::util::logging::StreamHandler::publish()`, `decaf::io::FilterInputStream::read()`,
`decaf::io::FilterInputStream::reset()`, `decaf::io::FilterInputStream::skip()`, `de-`

#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **activemq::wireformat::WireFormatRegistry**
*Registry of all **WireFormat** (p. 2693) Factories that are available to the client at runtime.*

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::wireformat**

7.363 src/main/cms/BytesMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
```

Data Structures

- class **cms::BytesMessage**

*A **BytesMessage** (p. 759) object is used to send a message containing a stream of unsigned bytes.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.364 src/main/cms/Closeable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Closeable**
Interface for a class that implements the close method.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.365 src/main/decaf/io/Closeable.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::io::Closeable**
Interface for a class that implements the close method.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.366 src/main/cms/CMSException.h File Reference

```
#include <string>
#include <vector>
#include <iostream>
#include <exception>
#include <cms/Config.h>
```

Data Structures

- class **cms::CMSException**

CMS API Exception that is the base for all exceptions thrown from CMS classes.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.367 src/main/cms/CMSProperties.h File Reference

```
#include <cms/Config.h>
#include <map>
#include <string>
#include <vector>
```

Data Structures

- class **cms::CMSProperties**
Interface for a Java-like properties object.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.368 src/main/cms/CMSSecurityException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::CMSSecurityException**

This exception must be thrown when a provider rejects a user name/password submitted by a client.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.369 src/main/cms/Connection.h File Reference

```
#include <cms/Config.h>
#include <cms/Startable.h>
#include <cms/Stopable.h>
#include <cms/Closeable.h>
#include <cms/Session.h>
#include <cms/ConnectionMetaData.h>
```

Data Structures

- class **cms::Connection**
The client's connection to its provider.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.370 src/main/cms/ConnectionFactory.h File Reference

```
#include <cms/Config.h>
#include <cms/Connection.h>
#include <cms/CMSException.h>
#include <string>
```

Data Structures

- class **cms::ConnectionFactory**

*Defines the interface for a factory that creates connection objects, the **Connection** (p. 941) objects returned implement the CMS **Connection** (p. 941) interface and hide the CMS Provider specific implementation details behind that interface.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.371 src/main/cms/ConnectionMetaData.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ConnectionMetaData**

*A **ConnectionMetaData** (p. 1015) object provides information describing the **Connection** (p. 941) object.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.372 src/main/cms/DeliveryMode.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::DeliveryMode**

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.373 src/main/cms/Destination.h File Reference

```
#include <cms/CMSProperties.h>
#include <cms/Config.h>
#include <string>
```

Data Structures

- class **cms::Destination**

*A **Destination** (p. 1190) object encapsulates a provider-specific address.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.374 src/main/cms/ExceptionListener.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ExceptionListener**

*If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 1275) that is registered with the **Connection** (p. 941).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.375 src/main/cms/IllegalStateException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::IllegalStateException**

This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.376 src/main/decaf/lang/exceptions/IllegalStateException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::IllegalStateException**

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.377 src/main/cms/InvalidClientIdException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidClientIdException**

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.378 src/main/cms/InvalidDestinationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidDestinationException**

This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.379 src/main/cms/InvalidSelectorException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidSelectorException**

This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.380 src/main/cms/MapMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
```

Data Structures

- class **cms::MapMessage**

*A **MapMessage** (p. 1701) object is used to send a set of name-value pairs.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.381 src/main/cms/MessageConsumer.h File Reference

```
#include <cms/Config.h>
#include <cms/MessageListener.h>
#include <cms/Message.h>
#include <cms/Closeable.h>
```

Data Structures

- class **cms::MessageConsumer**

A client uses a `MessageConsumer` (p. 1795) to received messages from a destination.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.382 src/main/cms/MessageEOFException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageEOFException**

*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2476) or **BytesMessage** (p. 759) is being read.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.383 src/main/cms/MessageFormatException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageFormatException**

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.384 src/main/cms/MessageListener.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::MessageListener**

A `MessageListener` (p. 1860) object is used to receive asynchronously delivered messages.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.385 src/main/cms/MessageNotReadableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageNotReadableException**

This exception must be thrown when a CMS client attempts to read a write-only message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.386 src/main/cms/MessageNotWriteableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageNotWriteableException**

This exception must be thrown when a CMS client attempts to write to a read-only message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.387 src/main/cms/MessageProducer.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/Destination.h>
#include <cms/Closeable.h>
#include <cms/CMSException.h>
#include <cms/DeliveryMode.h>
```

Data Structures

- class **cms::MessageProducer**

*A client uses a **MessageProducer** (p. 1878) object to send messages to a **Destination** (p. 1190).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.388 src/main/cms/ObjectMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
```

Data Structures

- class **cms::ObjectMessage**

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.389 src/main/cms/Queue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Queue**
An interface encapsulating a provider-specific queue name.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.390 src/main/decaf/util/Queue.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/AbstractCollection.h>
#include <decaf/lang/Exception.h>
#include <decaf/lang/exceptions/NoSuchElementException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::util::Queue< E >**

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**

7.391 src/main/cms/QueueBrowser.h File Reference

```
#include <vector>
#include <string>
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Queue.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::QueueBrowser**

*This class implements in interface for browsing the messages in a **Queue** (p. 2157) without removing them.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.392 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Message.h>
#include <cms/TextMessage.h>
#include <cms/BytesMessage.h>
#include <cms/MapMessage.h>
#include <cms/StreamMessage.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <cms/Topic.h>
#include <cms/Queue.h>
#include <cms/QueueBrowser.h>
#include <cms/TemporaryTopic.h>
#include <cms/TemporaryQueue.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Session**

*A **Session** (p. 2270) object is a single-threaded context for producing and consuming messages.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.393 src/main/cms/Startable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Startable**

Interface for a class that implements the start method.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.394 src/main/cms/Stoppable.h File Reference

```
#include <cms/Config.h>  
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Stoppable**
Interface for a class that implements the stop method.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.395 src/main/cms/StreamMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWriteableException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageEOFException.h>
```

Data Structures

- class **cms::StreamMessage**
*Interface for a **StreamMessage** (p. 2476).*

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.396 src/main/cms/TemporaryQueue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryQueue**
*Defines a Temporary **Queue** (p. 2157) based **Destination** (p. 1190).*

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.397 src/main/cms/TemporaryTopic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryTopic**
*Defines a Temporary **Topic** (p. 2571) based **Destination** (p. 1190).*

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.398 src/main/cms/TextMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TextMessage**
Interface for a text message.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.399 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Topic**
An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.400 src/main/decaf/internal/AprPool.h File Reference

```
#include <decaf/util/Config.h>
```

```
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::AprPool**

*Wraps an APR pool object so that classes in **decaf** (p. 94) can create a static member for use in static methods where apr function calls that need a pool are made.*

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**

7.401 src/main/decaf/internal/DecafRuntime.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/Runtime.h>
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::DecafRuntime**
Handles APR initialization and termination.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**

7.402 src/main/decaf/internal/io/StandardErrorOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
#include <decaf/util/concurrent/Mutex.h>
```

Data Structures

- class **decaf::internal::io::StandardErrorOutputStream**
Wrapper Around the Standard error Output facility on the current platform.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**
- namespace **decaf::internal::io**

- namespace **decaf::internal::nio**

7.410 src/main/decaf/internal/nio/ByteArrayPerspective.h File Reference

```
#include <decaf/internal/util/ByteArrayAdapter.h>
```

Data Structures

- class **decaf::internal::nio::ByteArrayPerspective**

This class extends `ByteArray` to create a reference counted byte array that can be held and used by several different `ByteBuffers` and allow them to know on destruction whose job it is to delete the perspective.

Defines

- **#define WAIT_INFINITE 0xFFFFFFFF**
The synchronized macro defines a mechanism for synchronizing a section of code.
- **#define synchronized(W)**

7.540.1 Define Documentation

7.540.1.1 #define synchronized(W)

Value:

```
if(false){}
else
    for( decaf::util::concurrent::Lock lock_W(W);
        lock_W.isLocked(); lock_W.unlock() )
```

7.540.1.2 #define WAIT_INFINITE 0xFFFFFFFF

The synchronized macro defines a mechanism for synchronizing a section of code. The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compilers restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

```
somefunction() { synchronized(X) { // Do something that needs synchronizing. } }
```

7.541 src/main/decaf/util/concurrent/ConcurrentMap.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Map.h>
#include <decaf/lang/exceptions/UnsupportedOperationException.h>

- **#define LOGDECAF_FATAL(logger, message) logger.fatal(__FILE__, __LINE__, message);**

7.572.1 Define Documentation

7.572.1.1 #define LOGDECAF_DEBUG(logger, message) logger.debug(__FILE__, __LINE__, message);

7.572.1.2 #define LOGDECAF_DEBUG_1(logger, message, value)

Value:

```
;
{
    std::ostringstream ostream;
    ostream << message << value;
    logger.debug(__FILE__, __LINE__, ostream.str());
}
```

- 7.572.1.3 `#define LOGDECAF_DECLARE(loggerName) static
decaf::util::logging::SimpleLogger loggerName;`
- 7.572.1.4 `#define LOGDECAF_DECLARE_LOCAL(loggerName) de-
caf::util::logging::Logger loggerName;`
- 7.572.1.5 `#define LOGDECAF_ERROR(logger, message) logger.error(__-
FILE __, __LINE __, message);`
- 7.572.1.6 `#define LOGDECAF_FATAL(logger, message) logger.fatal(__FILE __-
__, __LINE __, message);`
- 7.572.1.7 `#define LOGDECAF_INFO(logger, message) logger.info(__FILE __,
__LINE __, message);`
- 7.572.1.8 `#define LOGDECAF_INITIALIZE(loggerName,
className, loggerFamily) decaf::util::logging::SimpleLogger
className::loggerName(loggerFamily);`
- 7.572.1.9 `#define LOGDECAF_WARN(logger, message) logger.warn(__FILE __-
__, __LINE __, message);`
