Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.171.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 989). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.171.2 Constructor & Destructor Documentation

6.171.2.1 `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::ConnectionIdMarshaller()` [inline]

6.171.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::~~ConnectionIdMarshaller()` [inline, virtual]

6.171.3 Member Function Documentation

6.171.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.171.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.171.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.171.3.4 virtual void `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.171.3.5 virtual int `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.171.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.171.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.172.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 993). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.172.2 Constructor & Destructor Documentation

6.172.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::ConnectionIdMarshaller()` [inline]

6.172.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::~~ConnectionIdMarshaller()` [inline, virtual]

6.172.3 Member Function Documentation

6.172.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.172.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaller.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.172.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.172.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.172.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.172.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.172.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.173.1 Constructor & Destructor Documentation

6.173.1.1 **activemq::commands::ConnectionInfo::ConnectionInfo** (const **ConnectionInfo** &) [inline, protected]

6.173.1.2 **activemq::commands::ConnectionInfo::ConnectionInfo** ()

6.173.1.3 virtual **activemq::commands::ConnectionInfo::~~ConnectionInfo** () [virtual]

6.173.2 Member Function Documentation

6.173.2.1 virtual **ConnectionInfo*** **activemq::commands::ConnectionInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

6.173.2.2 virtual void activemq::commands::ConnectionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.173.2.3 virtual bool activemq::commands::ConnectionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.173.2.4 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath () [virtual]

6.173.2.5 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath () const [virtual]

6.173.2.6 virtual std::string& activemq::commands::ConnectionInfo::getClientId () [virtual]

6.173.2.7 virtual const std::string& activemq::commands::ConnectionInfo::getClientId () const [virtual]

6.173.2.8 virtual Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId () [virtual]

6.173.2.9 virtual const Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId () const [virtual]

6.173.2.10 virtual unsigned char activemq::commands::ConnectionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.173.2.11** `virtual std::string& activemq::commands::ConnectionInfo::getPassword () [virtual]`
- 6.173.2.12** `virtual const std::string& activemq::commands::ConnectionInfo::getPassword () const [virtual]`
- 6.173.2.13** `virtual std::string& activemq::commands::ConnectionInfo::getUserName () [virtual]`
- 6.173.2.14** `virtual const std::string& activemq::commands::ConnectionInfo::getUserName () const [virtual]`
- 6.173.2.15** `virtual bool activemq::commands::ConnectionInfo::isBrokerMasterConnector () const [virtual]`
- 6.173.2.16** `virtual bool activemq::commands::ConnectionInfo::isClientMaster () const [virtual]`
- 6.173.2.17** `virtual bool activemq::commands::ConnectionInfo::isConnectionInfo () const [inline, virtual]`

Returns:

an answer of true to the `isConnectionInfo()` (p. 1000) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 510).

- 6.173.2.18 `virtual bool activemq::commands::ConnectionInfo::isManageable () const [virtual]`
- 6.173.2.19 `ConnectionInfo& activemq::commands::ConnectionInfo::operator= (const ConnectionInfo &) [inline, protected]`
- 6.173.2.20 `virtual void activemq::commands::ConnectionInfo::setBrokerMasterConnector (bool brokerMasterConnector) [virtual]`
- 6.173.2.21 `virtual void activemq::commands::ConnectionInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath) [virtual]`
- 6.173.2.22 `virtual void activemq::commands::ConnectionInfo::setClientId (const std::string & clientId) [virtual]`
- 6.173.2.23 `virtual void activemq::commands::ConnectionInfo::setClientMaster (bool clientMaster) [virtual]`
- 6.173.2.24 `virtual void activemq::commands::ConnectionInfo::setConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`
- 6.173.2.25 `virtual void activemq::commands::ConnectionInfo::setManageable (bool manageable) [virtual]`
- 6.173.2.26 `virtual void activemq::commands::ConnectionInfo::setPassword (const std::string & password) [virtual]`
- 6.173.2.27 `virtual void activemq::commands::ConnectionInfo::setUserName (const std::string & userName) [virtual]`
- 6.173.2.28 `virtual std::string activemq::commands::ConnectionInfo::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

- 6.173.2.29 `virtual Pointer<Command> activemq::commands::ConnectionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.173.3 Field Documentation

6.174.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 1003). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.174.2 Constructor & Destructor Documentation

6.174.2.1 `activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::ConnectionInfoMarshaller()` [inline]

6.174.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::~~ConnectionInfoMarshaller()` [inline, virtual]

6.174.3 Member Function Documentation

6.174.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.174.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.174.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.174.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.174.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.174.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.174.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

6.175.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 1007). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.175.2 Constructor & Destructor Documentation

6.175.2.1 `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::ConnectionInfoMarshaller()` [inline]

6.175.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::~~ConnectionInfoMarshaller()` [inline, virtual]

6.175.3 Member Function Documentation

6.175.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.175.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.175.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.175.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.175.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.175.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.175.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

6.176.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::ConnectionInfoMarshaller()` [inline]

6.176.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::~~ConnectionInfoMarshaller()` [inline, virtual]

6.176.3 Member Function Documentation

6.176.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.176.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.176.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 529).

6.176.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 530).

6.176.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 531).

6.176.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.176.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

Gets an Vector of the CMSX property names.

6.177.1 Detailed Description

A **ConnectionMetaData** (p.1015) object provides information describing the **Connection** (p.941) object.

Since:

1.3

6.177.2 Constructor & Destructor Documentation

6.177.2.1 `virtual cms::ConnectionMetaData::~~ConnectionMetaData () [inline, virtual]`

6.177.3 Member Function Documentation

6.177.3.1 `virtual int cms::ConnectionMetaData::getCMSMajorVersion () const throw (cms::CMSException) [pure virtual]`

Gets the CMS major version number.

Returns:

the CMS API major version number

Exceptions:

CMSException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 206).

6.177.3.2 `virtual int cms::ConnectionMetaData::getCMSMinorVersion () const throw (cms::CMSException) [pure virtual]`

Gets the CMS minor version number.

Returns:

the CMS API minor version number

Exceptions:

CMSException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 206).

6.177.3.3 `virtual std::string cms::ConnectionMetaData::getCMSProviderName () const throw (cms::CMSException) [pure virtual]`

Gets the CMS provider name.

Returns:

the CMS provider name

Exceptions:

CMSException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 206).

6.177.3.4 `virtual std::string cms::ConnectionMetaData::getCMSVersion () const
throw (cms::CMSEException) [pure virtual]`

Gets the CMS API version.

Returns:

the CMS API Version in String form.

Exceptions:

CMSEException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 207).

6.177.3.5 `virtual std::vector<std::string>
cms::ConnectionMetaData::getCMSXPropertyNames ()
const throw (cms::CMSEException) [pure virtual]`

Gets an Vector of the CMSX property names.

Returns:

an Vector of CMSX property names

Exceptions:

CMSEException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 207).

6.177.3.6 `virtual int cms::ConnectionMetaData::getProviderMajorVersion () const
throw (cms::CMSEException) [pure virtual]`

Gets the CMS provider major version number.

Returns:

the CMS provider major version number

Exceptions:

CMSEException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 207).

6.177.3.7 `virtual int cms::ConnectionMetaData::getProviderMinorVersion () const
throw (cms::CMSEException) [pure virtual]`

Gets the CMS provider minor version number.

Returns:

the CMS provider minor version number

Exceptions:

CMSEException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 208).

6.177.3.8 **virtual std::string cms::ConnectionMetaData::getProviderVersion ()**
const throw (cms::CMSEException) [pure virtual]

Gets the CMS provider version.

Returns:

the CMS provider version

Exceptions:

CMSEException (p. 850) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 208).

[virtual]

Implements activemq::state::CommandVisitor (p. 888).

6.179.2.13 virtual Pointer<Command> activemq::state::ConnectionStateTracker::processDestinationInfo (DestinationInfo * *info*) throw (exceptions::ActiveMQException)
[virtual]

Implements activemq::state::CommandVisitor (p. 888).

6.179.2.14 virtual Pointer<Command> activemq::state::ConnectionStateTracker::processEndTransaction (TransactionInfo * *info*) throw (exceptions::ActiveMQException)
[virtual]

Implements activemq::state::CommandVisitor (p. 888).

6.179.2.15 virtual Pointer<Command> activemq::state::ConnectionStateTracker::processMessage (Message * *message*) throw (exceptions::ActiveMQException)
[virtual]

Implements activemq::state::CommandVisitor (p. 889).

6.179.2.16 virtual Pointer<Command> activemq::state::ConnectionStateTracker::processMessageAck (MessageAck * *ack*) throw (exceptions::ActiveMQException)
[virtual]

Implements activemq::state::CommandVisitor (p. 889).

6.179.2.17 virtual Pointer<Command> activemq::state::ConnectionStateTracker::processPrepareTransaction (TransactionInfo * *info*) throw (exceptions::ActiveMQException)
[virtual]

Implements activemq::state::CommandVisitor (p. 889).

6.179.2.18 `virtual Pointer<Command> activemq::state::ConnectionStateTracker::processProducerInfo (ProducerInfo * info) throw (exceptions::ActiveMQException)` [virtual]

Implements `activemq::state::CommandVisitor` (p. 890).

6.179.2.19 `virtual Pointer<Command> activemq::state::ConnectionStateTracker::processRemoveConnection (ConnectionId * id) throw (exceptions::ActiveMQException)` [virtual]

Implements `activemq::state::CommandVisitor` (p. 890).

6.179.2.20 `virtual Pointer<Command> activemq::state::ConnectionStateTracker::processRemoveConsumer (ConsumerId * id) throw (exceptions::ActiveMQException)` [virtual]

Implements `activemq::state::CommandVisitor` (p. 890).

6.179.2.21 `virtual Pointer<Command> activemq::state::ConnectionStateTracker::processRemoveDestination (DestinationInfo * info) throw (exceptions::ActiveMQException)` [virtual]

Implements `activemq::state::CommandVisitor` (p. 890).

6.179.2.22 `virtual Pointer<Command> activemq::state::ConnectionStateTracker::processRemoveProducer (ProducerId * id) throw (exceptions::ActiveMQException)` [virtual]

Implements `activemq::state::CommandVisitor` (p. 890).

6.179.2.23 `virtual Pointer<Command> activemq::state::ConnectionStateTracker::processRemoveSession (SessionId * id) throw (exceptions::ActiveMQException)` [virtual]

Implements `activemq::state::CommandVisitor` (p. 891).

6.179.2.24 `virtual Pointer<Command> activemq::state::ConnectionStateTracker::processRollbackTransaction (TransactionInfo * info) throw (exceptions::ActiveMQException)` [virtual]

Implements `activemq::state::CommandVisitor` (p. 891).

6.179.2.25 virtual Pointer<Command> activemq::state::ConnectionStateTracker::processSessionInfo (SessionInfo * *info*) throw (exceptions::ActiveMQException)
[virtual]

Implements activemq::state::CommandVisitor (p. 891).

6.179.2.26 void activemq::state::ConnectionStateTracker::restore (const Pointer<transport::Transport > & *transport*) throw (decaf::io::IOException)

6.179.2.27 void activemq::state::ConnectionStateTracker::setMaxCacheSize (int *maxCacheSize*) [inline]

6.179.2.28 void activemq::state::ConnectionStateTracker::setRestoreConsumers (bool *restoreConsumers*) [inline]

6.179.2.29 void activemq::state::ConnectionStateTracker::setRestoreProducers (bool *restoreProducers*) [inline]

6.179.2.30 void activemq::state::ConnectionStateTracker::setRestoreSessions (bool *restoreSessions*) [inline]

6.179.2.31 void activemq::state::ConnectionStateTracker::setRestoreTransaction (bool *restoreTransaction*) [inline]

6.179.2.32 void activemq::state::ConnectionStateTracker::setTrackMessages (bool *trackMessages*) [inline]

6.179.2.33 void activemq::state::ConnectionStateTracker::setTrackTransactions (bool *trackTransactions*) [inline]

6.179.2.34 Pointer<Tracked> activemq::state::ConnectionStateTracker::track (const Pointer< Command > & *command*) throw (decaf::io::IOException)

6.179.2.35 void activemq::state::ConnectionStateTracker::trackBack (const Pointer< Command > & *command*)

6.179.3 Friends And Related Function Documentation

6.179.3.1 friend class RemoveTransactionAction [friend]

The documentation for this class was generated from the following file:

6.180.1 Constructor & Destructor Documentation

6.180.1.1 **activemq::commands::ConsumerControl::ConsumerControl** (const **ConsumerControl** &) [inline, protected]

6.180.1.2 **activemq::commands::ConsumerControl::ConsumerControl** ()

6.180.1.3 **virtual** **activemq::commands::ConsumerControl::~~ConsumerControl** () [virtual]

6.180.2 Member Function Documentation

6.180.2.1 **virtual** **ConsumerControl*** **activemq::commands::ConsumerControl::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

6.180.2.2 **virtual** void **activemq::commands::ConsumerControl::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.180.2.3 `virtual bool activemq::commands::ConsumerControl::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.180.2.4 `virtual Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId ()` [virtual]

6.180.2.5 `virtual const Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId () const` [virtual]

6.180.2.6 `virtual unsigned char activemq::commands::ConsumerControl::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.180.2.7 `virtual int activemq::commands::ConsumerControl::getPrefetch () const`
[virtual]
- 6.180.2.8 `virtual bool activemq::commands::ConsumerControl::isClose () const`
[virtual]
- 6.180.2.9 `virtual bool activemq::commands::ConsumerControl::isFlush () const`
[virtual]
- 6.180.2.10 `virtual bool activemq::commands::ConsumerControl::isStart () const`
[virtual]
- 6.180.2.11 `virtual bool activemq::commands::ConsumerControl::isStop () const`
[virtual]
- 6.180.2.12 `ConsumerControl& activemq::commands::ConsumerControl::operator=`
(const ConsumerControl &) [inline, protected]
- 6.180.2.13 `virtual void activemq::commands::ConsumerControl::setClose (bool`
close) [virtual]
- 6.180.2.14 `virtual void activemq::commands::ConsumerControl::setConsumerId`
(const Pointer< ConsumerId > & *consumerId*) [virtual]
- 6.180.2.15 `virtual void activemq::commands::ConsumerControl::setFlush (bool`
flush) [virtual]
- 6.180.2.16 `virtual void activemq::commands::ConsumerControl::setPrefetch (int`
prefetch) [virtual]
- 6.180.2.17 `virtual void activemq::commands::ConsumerControl::setStart (bool`
start) [virtual]
- 6.180.2.18 `virtual void activemq::commands::ConsumerControl::setStop (bool`
stop) [virtual]
- 6.180.2.19 `virtual std::string activemq::commands::ConsumerControl::toString ()`
const [virtual]

Returns a string containing the information for this **DataSet** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p.512).

6.180.2.20 `virtual Pointer<Command> activemq::commands::ConsumerControl::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.180.3 Field Documentation

6.180.3.1 `bool activemq::commands::ConsumerControl::close` [protected]

6.180.3.2 `Pointer<ConsumerId> activemq::commands::ConsumerControl::consumerId` [protected]

6.180.3.3 `bool activemq::commands::ConsumerControl::flush` [protected]

Write a object instance to data output stream.

6.181.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p.1033). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.181.2 Constructor & Destructor Documentation

6.181.2.1 `activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::ConsumerControlMarshaller()` [inline]

6.181.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::~~ConsumerControlMarshaller()` [inline, virtual]

6.181.3 Member Function Documentation

6.181.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.181.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.181.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.181.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.181.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.181.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.181.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

6.182.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p.1037). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.182.2 Constructor & Destructor Documentation

6.182.2.1 `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::ConsumerControlMarshaller()` [inline]

6.182.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::~~ConsumerControlMarshaller()` [inline, virtual]

6.182.3 Member Function Documentation

6.182.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.182.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.182.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.182.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.182.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.182.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.182.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.183.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.183.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.183.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.183.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/ConsumerControlMarshaller.h

6.184 activemq::commands::ConsumerId Class Reference

#include <src/main/activemq/commands/ConsumerId.h> Inheritance diagram for activemq::commands::ConsumerId:

Public Types

- typedef decaf::lang::PointerComparator< ConsumerId > COMPARATOR

Public Member Functions

- **ConsumerId** ()
- **ConsumerId** (const **ConsumerId** &other)

Protected Attributes

- std::string **connectionId**
- long long **sessionId**
- long long **value**

6.184.1 Member Typedef Documentation

6.184.1.1 `typedef decaf::lang::PointerComparator<ConsumerId>
activemq::commands::ConsumerId::COMPARATOR`

6.184.2 Constructor & Destructor Documentation

6.184.2.1 `activemq::commands::ConsumerId::ConsumerId ()`

6.184.2.2 `activemq::commands::ConsumerId::ConsumerId (const ConsumerId &
other)`

6.184.2.3 `activemq::commands::ConsumerId::ConsumerId (const SessionId &
sessionId, long long consumerId) [inline]`

References `activemq::commands::SessionId::getConnectionId()`, and `activemq::commands::SessionId::getValue()`.

6.184.2.4 `virtual activemq::commands::ConsumerId::~~ConsumerId () [virtual]`

6.184.3 Member Function Documentation

6.184.3.1 `virtual ConsumerId* ac-
tivemq::commands::ConsumerId::cloneDataStructure ()
const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.184.3.2 `virtual int activemq::commands::ConsumerId::compareTo (const
ConsumerId & value) const [virtual]`

6.184.3.3 `virtual void activemq::commands::ConsumerId::copyDataStructure
(const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.184.3.4 virtual bool activemq::commands::ConsumerId::equals (const ConsumerId & *value*) const [virtual]

6.184.3.5 virtual bool activemq::commands::ConsumerId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.184.3.6 virtual std::string& activemq::commands::ConsumerId::getConnectionId () [virtual]

6.184.3.7 virtual const std::string& activemq::commands::ConsumerId::getConnectionId () const [virtual]

6.184.3.8 virtual unsigned char activemq::commands::ConsumerId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.184.3.9 `const Pointer<SessionId>& activemq::commands::ConsumerId::getParentId () const`
- 6.184.3.10 `virtual long long activemq::commands::ConsumerId::getSessionId () const [virtual]`
- 6.184.3.11 `virtual long long activemq::commands::ConsumerId::getValue () const [virtual]`
- 6.184.3.12 `virtual bool activemq::commands::ConsumerId::operator< (const ConsumerId & value) const [virtual]`
- 6.184.3.13 `ConsumerId& activemq::commands::ConsumerId::operator= (const ConsumerId & other)`
- 6.184.3.14 `virtual bool activemq::commands::ConsumerId::operator== (const ConsumerId & value) const [virtual]`
- 6.184.3.15 `virtual void activemq::commands::ConsumerId::setConnectionId (const std::string & connectionId) [virtual]`
- 6.184.3.16 `virtual void activemq::commands::ConsumerId::setSessionId (long long sessionId) [virtual]`
- 6.184.3.17 `virtual void activemq::commands::ConsumerId::setValue (long long value) [virtual]`
- 6.184.3.18 `virtual std::string activemq::commands::ConsumerId::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.560).

6.184.4 Field Documentation

- 6.184.4.1 `std::string activemq::commands::ConsumerId::connectionId [protected]`
- 6.184.4.2 `const unsigned char activemq::commands::ConsumerId::ID _ - CONSUMERID = 122 [static]`

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.184.4.3 `long long activemq::commands::ConsumerId::sessionId` [protected]

6.184.4.4 `long long activemq::commands::ConsumerId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ConsumerId.h`

6.185 activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller Class Reference

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p.1050).

Public Member Functions

- **ConsumerIdMarshaller** ()
- virtual **~ConsumerIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.185.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p.1050). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.185.2 Constructor & Destructor Documentation

6.185.2.1 `activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::ConsumerIdMarshaller()` [inline]

6.185.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::~~ConsumerIdMarshaller()` [inline, virtual]

6.185.3 Member Function Documentation

6.185.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.185.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.185.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.185.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.185.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.185.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.185.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.186.3 Member Function Documentation

6.186.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.186.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.186.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.186.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.186.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.186.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.186.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.187.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p.1058). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.187.2 Constructor & Destructor Documentation

6.187.2.1 `activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::ConsumerIdMarshaller()` [inline]

6.187.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::~~ConsumerIdMarshaller()` [inline, virtual]

6.187.3 Member Function Documentation

6.187.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.187.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.187.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.187.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.187.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.187.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.187.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/ConsumerIdMarshaller.h

6.188 activemq::commands::ConsumerInfo Class Reference

#include <src/main/activemq/commands/ConsumerInfo.h> Inheritance diagram for activemq::commands::ConsumerInfo:

Public Member Functions

- **ConsumerInfo** ()
- virtual **~ConsumerInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ConsumerInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*

6.188.1 Constructor & Destructor Documentation

6.188.1.1 `activemq::commands::ConsumerInfo::ConsumerInfo (const ConsumerInfo &) [inline, protected]`

6.188.1.2 `activemq::commands::ConsumerInfo::ConsumerInfo ()`

6.188.1.3 `virtual activemq::commands::ConsumerInfo::~~ConsumerInfo () [virtual]`

6.188.2 Member Function Documentation

6.188.2.1 `virtual ConsumerInfo* activemq::commands::ConsumerInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.188.2.2 `virtual void activemq::commands::ConsumerInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.188.2.3 `virtual bool activemq::commands::ConsumerInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

- 6.188.2.4 `virtual Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () [virtual]`
- 6.188.2.5 `virtual const Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () const [virtual]`
- 6.188.2.6 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath () [virtual]`
- 6.188.2.7 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath () const [virtual]`
- 6.188.2.8 `virtual Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId () [virtual]`
- 6.188.2.9 `virtual const Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId () const [virtual]`
- 6.188.2.10 `virtual unsigned char activemq::commands::ConsumerInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new `DataStructure` (p. 1174) type copy.

Implements `activemq::commands::DataStructure` (p. 1176).

- 6.188.2.11 `virtual Pointer<ActiveMQDestination>& activemq::commands::ConsumerInfo::getDestination ()`
[virtual]
- 6.188.2.12 `virtual const Pointer<ActiveMQDestination>& activemq::commands::ConsumerInfo::getDestination () const` [virtual]
- 6.188.2.13 `virtual int activemq::commands::ConsumerInfo::getMaximumPendingMessageLimit () const` [virtual]
- 6.188.2.14 `virtual int activemq::commands::ConsumerInfo::getPrefetchSize () const`
[virtual]
- 6.188.2.15 `virtual unsigned char activemq::commands::ConsumerInfo::getPriority () const` [virtual]
- 6.188.2.16 `virtual std::string& activemq::commands::ConsumerInfo::getSelector ()`
[virtual]
- 6.188.2.17 `virtual const std::string& activemq::commands::ConsumerInfo::getSelector () const`
[virtual]
- 6.188.2.18 `virtual std::string& activemq::commands::ConsumerInfo::getSubscriptionName ()` [virtual]
- 6.188.2.19 `virtual const std::string& activemq::commands::ConsumerInfo::getSubscriptionName () const` [virtual]
- 6.188.2.20 `virtual bool activemq::commands::ConsumerInfo::isBrowser () const`
[virtual]
- 6.188.2.21 `virtual bool activemq::commands::ConsumerInfo::isConsumerInfo () const` [inline, virtual]

Returns:

an answer of true to the `isConsumerInfo()` (p. 1066) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 510).

-
- 6.188.2.22 virtual bool activemq::commands::ConsumerInfo::isDispatchAsync () const [virtual]
 - 6.188.2.23 virtual bool activemq::commands::ConsumerInfo::isExclusive () const [virtual]
 - 6.188.2.24 virtual bool activemq::commands::ConsumerInfo::isNetworkSubscription () const [virtual]
 - 6.188.2.25 virtual bool activemq::commands::ConsumerInfo::isNoLocal () const [virtual]
 - 6.188.2.26 virtual bool activemq::commands::ConsumerInfo::isNoRangeAcks () const [virtual]
 - 6.188.2.27 virtual bool activemq::commands::ConsumerInfo::isOptimizedAcknowledge () const [virtual]
 - 6.188.2.28 virtual bool activemq::commands::ConsumerInfo::isRetroactive () const [virtual]
 - 6.188.2.29 ConsumerInfo& activemq::commands::ConsumerInfo::operator= (const ConsumerInfo &) [inline, protected]
 - 6.188.2.30 virtual void activemq::commands::ConsumerInfo::setAdditionalPredicate (const Pointer< BooleanExpression > & *additionalPredicate*) [virtual]
 - 6.188.2.31 virtual void activemq::commands::ConsumerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]
 - 6.188.2.32 virtual void activemq::commands::ConsumerInfo::setBrowser (bool *browser*) [virtual]
 - 6.188.2.33 virtual void activemq::commands::ConsumerInfo::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]
 - 6.188.2.34 virtual void activemq::commands::ConsumerInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
 - 6.188.2.35 virtual void activemq::commands::ConsumerInfo::setDispatchAsync (bool *dispatchAsync*) [virtual]
 - 6.188.2.36 virtual void activemq::commands::ConsumerInfo::setExclusive (bool *exclusive*) [virtual]
 - 6.188.2.37 virtual void activemq::commands::ConsumerInfo::setMaximumPendingMessageLimit (int *maximumPendingMessageLimit*) [virtual]
 - 6.188.2.38 virtual void activemq::commands::ConsumerInfo::setNetworkSubscription (bool *networkSubscription*) [virtual]
 - 6.188.2.39 virtual void activemq::commands::ConsumerInfo::setNoLocal (bool *noLocal*) [virtual]
 - 6.188.2.40 virtual void activemq::commands::ConsumerInfo::setNoRangeAcks (bool *noRangeAcks*) [virtual]
 - 6.188.2.41 virtual void ac-
-

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 512).

6.188.2.48 `virtual Pointer<Command> activemq::commands::ConsumerInfo::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.188.3 Field Documentation

6.189.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1070). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.189.2 Constructor & Destructor Documentation

6.189.2.1 `activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::ConsumerInfoMarshaller()` `[inline]`

6.189.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller()` `[inline, virtual]`

6.189.3 Member Function Documentation

6.189.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.189.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.189.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.189.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.189.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.189.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.189.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

6.190.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1074). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.190.2 Constructor & Destructor Documentation

6.190.2.1 `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::ConsumerInfoMarshaller()` [inline]

6.190.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller()` [inline, virtual]

6.190.3 Member Function Documentation

6.190.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.190.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.190.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.190.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.190.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.190.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.190.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.191.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1078). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.191.2 Constructor & Destructor Documentation

6.191.2.1 `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::ConsumerInfoMarshaller()` [inline]

6.191.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller()` [inline, virtual]

6.191.3 Member Function Documentation

6.191.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.191.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.191.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.191.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.191.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.191.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.191.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

6.193 activemq::commands::ControlCommand Class Reference

#include <src/main/activemq/commands/ControlCommand.h> Inheritance diagram for activemq::commands::ControlCommand:

Public Member Functions

- **ControlCommand** ()
- virtual **~ControlCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ControlCommand * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const std::string & **getCommand** () const
- virtual std::string & **getCommand** ()
- virtual void **setCommand** (const std::string &command)
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_CONTROLCOMMAND** = 14

Protected Member Functions

- **ControlCommand** (const **ControlCommand** &)
- **ControlCommand & operator=** (const **ControlCommand** &)

Protected Attributes

- std::string **command**

6.193.1 Constructor & Destructor Documentation

6.193.1.1 `activemq::commands::ControlCommand::ControlCommand (const ControlCommand &) [inline, protected]`

6.193.1.2 `activemq::commands::ControlCommand::ControlCommand ()`

6.193.1.3 `virtual activemq::commands::ControlCommand::~~ControlCommand () [virtual]`

6.193.2 Member Function Documentation

6.193.2.1 `virtual ControlCommand* activemq::commands::ControlCommand::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.193.2.2 `virtual void activemq::commands::ControlCommand::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.193.2.3 `virtual bool activemq::commands::ControlCommand::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

- 6.193.2.4** `virtual std::string& activemq::commands::ControlCommand::getCommand ()`
[virtual]
- 6.193.2.5** `virtual const std::string& activemq::commands::ControlCommand::getCommand ()`
const [virtual]
- 6.193.2.6** `virtual unsigned char activemq::commands::ControlCommand::getDataStructureType () const`
[virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.193.2.7** `ControlCommand& activemq::commands::ControlCommand::operator=`
(const ControlCommand &) [inline, protected]
- 6.193.2.8** `virtual void activemq::commands::ControlCommand::setCommand (const`
std::string & *command*) [virtual]
- 6.193.2.9** `virtual std::string activemq::commands::ControlCommand::toString ()`
const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

- 6.193.2.10** `virtual Pointer<Command> activemq::commands::ControlCommand::visit`
(activemq::state::CommandVisitor * *visitor*) throw (
exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.193.3 Field Documentation

6.193.3.1 `std::string activemq::commands::ControlCommand::command`
[protected]

6.193.3.2 `const unsigned char activemq::commands::ControlCommand::ID_ -
CONTROLCOMMAND = 14` [static]

6.194.3 Member Function Documentation

6.194.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.194.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::getDataStructur`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.194.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.194.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.194.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.194.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.194.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

6.195.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.195.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::getDataStructur`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.195.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.195.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.195.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.195.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

6.196.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.196.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::getDataStructur`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.196.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.196.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.196.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.196.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.196.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/ControlCommandMarshaller.h

6.197 decaf::util::concurrent::CountDownLatch Class Reference

```
#include <src/main/decaf/util/concurrent/CountDownLatch.h>
```

Public Member Functions

- **CountDownLatch** (int count)
Constructor.
- virtual **~CountDownLatch** ()
- virtual void **await** () throw (lang::Exception)
Waits for the Count to be zero, and then returns.
- virtual bool **await** (unsigned long timeOut) throw (lang::Exception)
Waits for the Count to hit zero, or a timeout.
- virtual void **countDown** ()
Counts down the latch, releasing all waiting threads when the count hits zero.
- virtual int **getCount** () const
Gets the current count.

6.197.1 Constructor & Destructor Documentation

6.197.1.1 decaf::util::concurrent::CountDownLatch::CountDownLatch (int count)

Constructor.

Parameters:

count - number to count down from.

6.197.1.2 virtual decaf::util::concurrent::CountDownLatch::~~CountDownLatch () [virtual]

6.197.2 Member Function Documentation

6.197.2.1 virtual bool decaf::util::concurrent::CountDownLatch::await (unsigned long timeOut) throw (lang::Exception) [virtual]

Waits for the Count to hit zero, or a timeout.

Parameters:

timeOut - time in milliseconds to wait.

Returns:

true if the wait made it to count zero, otherwise false

6.197.2.2 `virtual void decaf::util::concurrent::CountDownLatch::await () throw (lang::Exception) [virtual]`

Waits for the Count to be zero, and then returns.

Exceptions:

CMSException

6.197.2.3 `virtual void decaf::util::concurrent::CountDownLatch::countDown () [virtual]`

Counts down the latch, releasing all waiting threads when the count hits zero.

6.197.2.4 `virtual int decaf::util::concurrent::CountDownLatch::getCount () const [inline, virtual]`

Gets the current count.

Returns:

int count value

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/CountDownLatch.h`

6.198 activemq::commands::DataArrayResponse Class Reference

#include <src/main/activemq/commands/DataArrayResponse.h> Inheritance diagram for activemq::commands::DataArrayResponse:

Public Member Functions

- **DataArrayResponse** ()
- virtual **~DataArrayResponse** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DataArrayResponse * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** () const
- virtual std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** ()
- virtual void **setData** (const std::vector< **decaf::lang::Pointer**< **DataStructure** > > &data)

Static Public Attributes

- static const unsigned char **ID_DATAARRAYRESPONSE** = 33

Protected Member Functions

- **DataArrayResponse** (const **DataArrayResponse** &)
- **DataArrayResponse** & **operator=** (const **DataArrayResponse** &)

Protected Attributes

- std::vector< **decaf::lang::Pointer**< **DataStructure** > > **data**

6.198.1 Constructor & Destructor Documentation

6.198.1.1 `activemq::commands::DataArrayResponse::DataArrayResponse (const DataArrayResponse &) [inline, protected]`

6.198.1.2 `activemq::commands::DataArrayResponse::DataArrayResponse ()`

6.198.1.3 `virtual activemq::commands::DataArrayResponse::~~DataArrayResponse () [virtual]`

6.198.2 Member Function Documentation

6.198.2.1 `virtual DataArrayResponse* activemq::commands::DataArrayResponse::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::Response` (p. 2232).

6.198.2.2 `virtual void activemq::commands::DataArrayResponse::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::Response` (p. 2232).

6.198.2.3 `virtual bool activemq::commands::DataArrayResponse::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p. 2232).

- 6.198.2.4** `virtual std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () [virtual]`
- 6.198.2.5** `virtual const std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () const [virtual]`
- 6.198.2.6** `virtual unsigned char activemq::commands::DataArrayResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from **activemq::commands::Response** (p. 2233).

- 6.198.2.7** `DataArrayResponse& activemq::commands::DataArrayResponse::operator= (const DataArrayResponse &) [inline, protected]`

Reimplemented from **activemq::commands::Response** (p. 2233).

- 6.198.2.8** `virtual void activemq::commands::DataArrayResponse::setData (const std::vector< decaf::lang::Pointer< DataStructure > > & data) [virtual]`
- 6.198.2.9** `virtual std::string activemq::commands::DataArrayResponse::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2233).

6.198.3 Field Documentation

- 6.198.3.1** `std::vector< decaf::lang::Pointer<DataStructure> > activemq::commands::DataArrayResponse::data [protected]`
- 6.198.3.2** `const unsigned char activemq::commands::DataArrayResponse::ID_ - DATAARRAYRESPONSE = 33 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/DataArrayResponse.h`

6.199 activemq::wireformat::openwire::marshal::v3::DataArrayResponse Class Reference

Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 1104).

#include <src/main/activemq/wireformat/openwire/marshal/v3/DataArrayResponseMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller:

Public Member Functions

- **DataArrayResponseMarshaller** ()
- virtual **~DataArrayResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.199.1 Detailed Description

Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 1104). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.199.2 Constructor & Destructor Documentation

6.199.2.1 `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::DataArrayR
 () [inline]`

6.199.2.2 `virtual
 activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::~~DataArray
 () [inline, virtual]`

6.199.3 Member Function Documentation

6.199.3.1 `virtual commands::DataStructure* ac-
 tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::createObject
 () const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller`
 (p. 2247).

6.199.3.2 `virtual unsigned char ac-
 tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::getDataStruct
 () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller`
 (p. 2247).

6.199.3.3 `virtual void ac-
 tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseMarshal
 (OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
 decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.199.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2248).

6.199.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2248).

6.199.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2249).

6.199.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2250).

The documentation for this class was generated from the following file:

6.200.1 Detailed Description

Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 1108). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.200.2 Constructor & Destructor Documentation

6.200.2.1 `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::DataArrayResponseMarshaller()` [inline]

6.200.2.2 `virtual activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::~~DataArrayResponseMarshaller()` [inline, virtual]

6.200.3 Member Function Documentation

6.200.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.200.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.200.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.200.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2253).

6.200.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2253).

6.200.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2254).

6.200.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2255).

The documentation for this class was generated from the following file:

6.201.3 Member Function Documentation

6.201.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.201.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.201.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.201.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.201.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.201.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2244).

6.201.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2245).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**DataArrayResponseMarshaller.h**

6.202 decaf::io::DataInputStream Class Reference

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

#include <src/main/decaf/io/DataInputStream.h> Inheritance diagram for decaf::io::DataInputStream:

Public Member Functions

- **DataInputStream** (**InputStream** *inputStream, bool own=false)
*Creates a **DataInputStream** (p. 1116) that uses the specified underlying **InputStream** (p. 1406).*
- virtual ~**DataInputStream** ()
- virtual int **read** (std::vector< unsigned char > &buffer) throw (io::IOException)
Reads some number of bytes from the contained input stream and stores them into the buffer array b.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (io::IOException, lang::exceptions::NullPointerException)
Reads up to len bytes of data from the contained input stream into an array of bytes.
- virtual bool **readBoolean** () throw (io::IOException, io::EOFException)
Reads one input byte and returns true if that byte is nonzero, false if that byte is zero.
- virtual char **readByte** () throw (io::IOException, io::EOFException)
Reads and returns one input byte.
- virtual unsigned char **readUnsignedByte** () throw (io::IOException, io::EOFException)
Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.
- virtual char **readChar** () throw (io::IOException, io::EOFException)
Reads an input char and returns the char value.
- virtual double **readDouble** () throw (io::IOException, io::EOFException)
Reads eight input bytes and returns a double value.
- virtual float **readFloat** () throw (io::IOException, io::EOFException)
Reads four input bytes and returns a float value.
- virtual int **readInt** () throw (io::IOException, io::EOFException)
Reads four input bytes and returns an int value.
- virtual long long **readLong** () throw (io::IOException, io::EOFException)
Reads eight input bytes and returns a long value.

- virtual short **readShort** () throw (io::IOException, io::EOFException)
Reads two input bytes and returns a short value.
- virtual unsigned short **readUnsignedShort** () throw (io::IOException, io::EOFException)
Reads two input bytes and returns an int value in the range 0 through 65535.
- virtual std::string **readString** () throw (io::IOException, io::EOFException)
Reads an null terminated ASCII string to the stream and returns the string to the caller.
- virtual std::string **readUTF** () throw (io::IOException, io::EOFException, io::UTFDataFormatException)
Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.
- virtual void **readFully** (std::vector< unsigned char > &buffer) throw (io::IOException, io::EOFException)
Reads some bytes from an input stream and stores them into the buffer array buffer.
- virtual void **readFully** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (io::IOException, io::EOFException, lang::exceptions::NullPointerException)
Reads length bytes from an input stream.
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.202.1 Detailed Description

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way. An application uses a data output stream to write data that can later be read by a data input stream.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped **InputStream** (p.1406) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

```
DataInputStream (p.1116) os = new DataInputStream (p.1116)( new InputStream(), true )
```

Since:

1.0

6.202.2 Constructor & Destructor Documentation

6.202.2.1 decaf::io::DataInputStream::DataInputStream (InputStream * inputStream, bool own = false)

Creates a **DataInputStream** (p.1116) that uses the specified underlying **InputStream** (p.1406).

Parameters:

inputStream the **InputStream** (p. 1406) instance to wrap.
own indicates if this class owns the wrapped string defaults to false.

6.202.2.2 `virtual decaf::io::DataInputStream::~~DataInputStream ()` [virtual]

6.202.3 Member Function Documentation

6.202.3.1 `virtual int decaf::io::DataInputStream::read (unsigned char * buffer,
std::size_t offset, std::size_t length) throw (io::IOException,
lang::exceptions::NullPointerException)` [virtual]

Reads up to len bytes of data from the contained input stream into an array of bytes. An attempt is made to read as many as len bytes, but a smaller number may be read, possibly zero. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If buffer is null, a NullPointerException is thrown.

If off is negative, or len is negative then an IndexOutOfBoundsException is thrown, if off + len is greater than the allocated length of the array, an **IOException** (p. 1477) will result depending on the platform and compiler settings.

If len is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into buffer.

The first byte read is stored into element b[off], the next one into buffer[off+1], and so on. The number of bytes read is, at most, equal to len. Let k be the number of bytes actually read; these bytes will be stored in elements buffer[off] through buffer[off+k-1], leaving elements buffer[off+k] through buffer[off+len-1] unaffected.

In every case, elements buffer[0] through buffer[off] and elements buffer[off+len] through buffer[buffer.length-1] are unaffected.

If the first byte cannot be read for any reason other than end of file, then an **IOException** (p. 1477) is thrown. In particular, an **IOException** (p. 1477) is thrown if the input stream has been closed.

Parameters:

buffer - byte array to insert read data into
offset - location in buffer to start writing
length - number of bytes to read

Returns:

the total number of bytes read, or -1 if there is no more data because the stream is EOF.

Exceptions:

IOException (p. 1477)
NullPointerException if the buffer is null

Reimplemented from **decaf::io::FilterInputStream** (p. 1319).

6.202.3.2 virtual int decaf::io::DataInputStream::read (std::vector< unsigned char > & *buffer*) throw (io::IOException) [virtual]

Reads some number of bytes from the contained input stream and stores them into the buffer array *b*. The number of bytes actually read is returned as an integer. This method blocks until input data is available, end of file is detected, or an exception is thrown.

If the length of *buffer* is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into *buffer*.

The first byte read is stored into element *buffer*[0], the next one into *buffer*[1], and so on. The number of bytes read is, at most, equal to the length of *buffer*. Let *k* be the number of bytes actually read; these bytes will be stored in elements *b*[0] through *b*[*k*-1], leaving elements *buffer*[*k*] through *buffer*[*buffer*.length-1] unaffected.

If the first byte cannot be read for any reason other than end of file, then an **IOException** (p.1477) is thrown. In particular, an **IOException** (p.1477) is thrown if the input stream has been closed.

The *read(buffer)* method has the same effect as: *read(buffer, 0, b.length)*

Parameters:

buffer - byte array to insert read data into

Returns:

the total number of bytes read, or -1 if there is no more data because the stream is EOF.

Exceptions:

IOException (p. 1477)

6.202.3.3 virtual bool decaf::io::DataInputStream::readBoolean () throw (io::IOException, io::EOFException) [virtual]

Reads one input byte and returns true if that byte is nonzero, false if that byte is zero.

Returns:

the boolean value read.

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.4 virtual char decaf::io::DataInputStream::readByte () throw (io::IOException, io::EOFException) [virtual]

Reads and returns one input byte. The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns:

the 8-bit value read.

Exceptions:***IOException*** (p. 1477)***EOFException*** (p. 1265)**6.202.3.5** virtual char decaf::io::DataInputStream::readChar () throw (
io::IOException, io::EOFException) [virtual]

Reads an input char and returns the char value. A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns:

the 8 bit char read

Exceptions:***IOException*** (p. 1477)***EOFException*** (p. 1265)**6.202.3.6** virtual double decaf::io::DataInputStream::readDouble () throw (
io::IOException, io::EOFException) [virtual]

Reads eight input bytes and returns a double value. It does this by first constructing a long long value in exactly the manner of the `readLong` method, then converting this long value to a double in exactly the manner of the method `Double.longBitsToDouble`.

Returns:

the double value read

Exceptions:***IOException*** (p. 1477)***EOFException*** (p. 1265)**6.202.3.7** virtual float decaf::io::DataInputStream::readFloat () throw (
io::IOException, io::EOFException) [virtual]

Reads four input bytes and returns a float value. It does this by first constructing an int value in exactly the manner of the `readInt` method, then converting this int value to a float in exactly the manner of the method `Float.intBitsToFloat`.

Returns:

the float value read

Exceptions:***IOException*** (p. 1477)***EOFException*** (p. 1265)

6.202.3.8 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer*, std::size_t *offset*, std::size_t *length*) throw (io::IOException, io::EOFException, lang::exceptions::NullPointerException) [virtual]

Reads *length* bytes from an input stream. This method blocks until one of the following conditions occurs: * *length* bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1265) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1477) other than **EOFException** (p. 1265) is thrown.

If *buffer* is null, a **NullPointerException** is thrown. If *offset* is negative, or *len* is negative, or *offset*+*length* is greater than the length of the array *buffer*, then an **IndexOutOfBoundsException** is thrown. If *len* is zero, then no bytes are read. Otherwise, the first byte read is stored into element *buffer*[*off*], the next one into *buffer*[*offset*+1], and so on. The number of bytes read is, at most, equal to *len*.

Parameters:

buffer - byte array to insert read data into

offset - location in *buffer* to start writing

length - number of bytes to read

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

NullPointerException if the *buffer* is null

6.202.3.9 virtual void decaf::io::DataInputStream::readFully (std::vector< unsigned char > & *buffer*) throw (io::IOException, io::EOFException) [virtual]

Reads some bytes from an input stream and stores them into the buffer array *buffer*. The number of bytes read is equal to the length of *buffer*.

This method blocks until one of the following conditions occurs: * *buffer.size()* bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1265) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1477) other than **EOFException** (p. 1265) is thrown.

If *buffer.size()* is zero, then no bytes are read. Otherwise, the first byte read is stored into element *b*[0], the next one into *buffer*[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of *buffer* have been updated with data from the input stream.

Parameters:

buffer - vector of char that is read to its size()

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.10 `virtual int decaf::io::DataInputStream::readInt () throw (io::IOException, io::EOFException) [virtual]`

Reads four input bytes and returns an int value. Let a be the first byte read, b be the second byte, c be the third byte, and d be the fourth byte. The value returned is:

$((a \& 0xff) \ll 24) | ((b \& 0xff) \ll 16) | ((c \& 0xff) \ll 8) | (d \& 0xff)$

Returns:

the int value read

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.11 `virtual long long decaf::io::DataInputStream::readLong () throw (io::IOException, io::EOFException) [virtual]`

Reads eight input bytes and returns a long value. Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be the sixth byte, g be the seventh byte, and h be the eighth byte. The value returned is: $(((\text{long})(a \& 0xff) \ll 56) | ((\text{long})(b \& 0xff) \ll 48) | ((\text{long})(c \& 0xff) \ll 40) | ((\text{long})(d \& 0xff) \ll 32) | ((\text{long})(e \& 0xff) \ll 24) | ((\text{long})(f \& 0xff) \ll 16) | ((\text{long})(g \& 0xff) \ll 8) | ((\text{long})(h \& 0xff)))$

Returns:

the 64 bit long long read

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.12 `virtual short decaf::io::DataInputStream::readShort () throw (io::IOException, io::EOFException) [virtual]`

Reads two input bytes and returns a short value. Let a be the first byte read and b be the second byte. The value returned is: $(\text{short})((a \ll 8) | (b \& 0xff))$

Returns:

the 16 bit short value read

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.13 virtual std::string decaf::io::DataInputStream::readString () throw (io::IOException, io::EOFException) [virtual]

Reads an null terminated ASCII string to the stream and returns the string to the caller.

Returns:

string object containing the string read.

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.14 virtual unsigned char decaf::io::DataInputStream::readUnsignedByte () throw (io::IOException, io::EOFException) [virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns:

the 8 bit unsigned value read

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.15 virtual unsigned short decaf::io::DataInputStream::readUnsignedShort () throw (io::IOException, io::EOFException) [virtual]

Reads two input bytes and returns an int value in the range 0 through 65535. Let a be the first byte read and b be the second byte. The value returned is: (((a & 0xff) << 8) | (b & 0xff))

Returns:

the 16 bit unsigned short read

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

6.202.3.16 virtual std::string decaf::io::DataInputStream::readUTF () throw (io::IOException, io::EOFException, io::UTFDataFormatException) [virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException. This method reads String value written from a Java **DataOutputStream** (p. 1125) and assumes that the length prefix precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns:

The decoded string read from stream.

Exceptions:

IOException (p. 1477)

EOFException (p. 1265)

UTFDataFormatException (p. 2683)

6.202.3.17 `virtual std::size_t decaf::io::DataInputStream::skip
(std::size_t num) throw (io::IOException,
lang::exceptions::UnsupportedOperationException) [virtual]`

Makes an attempt to skip over *n* bytes of data from the input stream, discarding the skipped bytes. However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 1265). The actual number of bytes skipped is returned.

Parameters:

num - number of bytes to skip

Returns:

the total number of bytes skipped

Reimplemented from **decaf::io::FilterInputStream** (p. 1320).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/DataInputStream.h`

6.203 decaf::io::DataOutputStream Class Reference

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

#include <src/main/decaf/io/DataOutputStream.h> Inheritance diagram for decaf::io::DataOutputStream:

Public Member Functions

- **DataOutputStream** (**OutputStream** ***outputStream**, bool **own**=false)
Creates a new data output stream to write data to the specified underlying output stream.
- virtual ~**DataOutputStream** ()
- virtual std::size_t **size** () const
Returns the current value of the counter written, the number of bytes written to this data output stream so far.
- virtual void **write** (unsigned char **c**) throw (**IOException**)
Writes a single byte to the output stream.
- virtual void **write** (const unsigned char ***buffer**, std::size_t **offset**, std::size_t **len**) throw (**IOException**, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **write** (const std::vector< unsigned char > &**buffer**) throw (**IOException**)
Writes an array of bytes to the output stream.
- virtual void **writeBoolean** (bool **value**) throw (**IOException**)
Writes a boolean to the underlying output stream as a 1-byte value.
- virtual void **writeByte** (unsigned char **value**) throw (**IOException**)
Writes out a byte to the underlying output stream as a 1-byte value.
- virtual void **writeShort** (short **value**) throw (**IOException**)
Writes a short to the underlying output stream as two bytes, high byte first.
- virtual void **writeUnsignedShort** (unsigned short **value**) throw (**IOException**)
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual void **writeChar** (char **value**) throw (**IOException**)
Writes out a char to the underlying output stream as a one byte value. If no exception is thrown, the counter written is incremented by 1.
- virtual void **writeInt** (int **value**) throw (**IOException**)
Writes an int to the underlying output stream as four bytes, high byte first.
- virtual void **writeLong** (long long **value**) throw (**IOException**)
Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.

- virtual void **writeFloat** (float value) throw (IOException)

Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.

- virtual void **writeDouble** (double value) throw (IOException)

Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.

- virtual void **writeBytes** (const std::string &value) throw (IOException)

Writes out the string to the underlying output stream as a sequence of bytes.

- virtual void **writeChars** (const std::string &value) throw (IOException)

Writes a string to the underlying output stream as a sequence of characters.

- virtual void **writeUTF** (const std::string &value) throw (IOException, UTFDataFormatException)

Writes out the string to the underlying output stream as a modified UTF-8 encoded sequence of bytes.

Protected Attributes

- std::size_t **written**
- unsigned char **buffer** [8]

6.203.1 Detailed Description

A data output stream lets an application write primitive Java data types to an output stream in a portable way. An application can then use a data input stream to read the data back in.

6.203.2 Constructor & Destructor Documentation

6.203.2.1 decaf::io::DataOutputStream::DataOutputStream (OutputStream * *outputStream*, bool *own* = false)

Creates a new data output stream to write data to the specified underlying output stream.

Parameters:

outputStream a stream to wrap with this one.

own true if this objects owns the stream that it wraps.

6.203.2.2 virtual decaf::io::DataOutputStream::~~DataOutputStream () [virtual]

6.203.3 Member Function Documentation

6.203.3.1 virtual std::size_t decaf::io::DataOutputStream::size () const [inline, virtual]

Returns the current value of the counter written, the number of bytes written to this data output stream so far. If the counter overflows, it will be wrapped to Integer.MAX_VALUE.

Returns:

the value of the written field.

6.203.3.2 virtual void decaf::io::DataOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Reimplemented from decaf::io::FilterOutputStream (p. 1326).

6.203.3.3 virtual void decaf::io::DataOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream. the counter written is incremented by len.

Parameters:

buffer The array of bytes to write.

offset the position in buffer to start writing from.

len The number of bytes from the buffer to be written.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException if buffer is Null

Reimplemented from decaf::io::FilterOutputStream (p. 1326).

6.203.3.4 virtual void decaf::io::DataOutputStream::write (unsigned char *c*) throw (IOException) [virtual]

Writes a single byte to the output stream. If no exception is thrown, the counter written is incremented by 1.

Parameters:

c the byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1327).

**6.203.3.5 virtual void decaf::io::DataOutputStream::writeBoolean (bool *value*)
throw (IOException) [virtual]**

Writes a boolean to the underlying output stream as a 1-byte value. The value true is written out as the value (byte)1; the value false is written out as the value (byte)0. If no exception is thrown, the counter written is incremented by 1.

Parameters:

value the boolean to write.

Exceptions:

IOException (p. 1477)

**6.203.3.6 virtual void decaf::io::DataOutputStream::writeByte (unsigned char
value) throw (IOException) [virtual]**

Writes out a byte to the underlying output stream as a 1-byte value. If no exception is thrown, the counter written is incremented by 1.

Parameters:

value the unsigned char value to write.

Exceptions:

IOException (p. 1477)

**6.203.3.7 virtual void decaf::io::DataOutputStream::writeBytes (const std::string &
value) throw (IOException) [virtual]**

Writes out the string to the underlying output stream as a sequence of bytes. Each character in the string is written out, in sequence, by discarding its high eight bits. If no exception is thrown, the counter written is incremented by the length of value. The value written does not include a trailing null as that is not part of the sequence of bytes, if the null is needed, then use the writeChars method.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.8 virtual void decaf::io::DataOutputStream::writeChar (char *value*) throw (IOException) [virtual]

Writes out a char to the underlying output stream as a one byte value. If no exception is thrown, the counter written is incremented by 1.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.9 virtual void decaf::io::DataOutputStream::writeChars (const std::string & *value*) throw (IOException) [virtual]

Writes a string to the underlying output stream as a sequence of characters. Each character is written to the data output stream as if by the writeChar method. If no exception is thrown, the counter written is incremented by the length of value. The trailing NULL character is written by this method.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.10 virtual void decaf::io::DataOutputStream::writeDouble (double *value*) throw (IOException) [virtual]

Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first. If no exception is thrown, the counter written is incremented by 8.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.11 virtual void decaf::io::DataOutputStream::writeFloat (float *value*) throw (IOException) [virtual]

Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first. If no exception is thrown, the counter written is incremented by 4.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.12 `virtual void decaf::io::DataOutputStream::writeInt (int value) throw (IOException) [virtual]`

Writes an int to the underlying output stream as four bytes, high byte first. If no exception is thrown, the counter written is incremented by 4.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.13 `virtual void decaf::io::DataOutputStream::writeLong (long long value) throw (IOException) [virtual]`

Writes an 64 bit long to the underlying output stream as eight bytes, high byte first. If no exception is thrown, the counter written is incremented by 8.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.14 `virtual void decaf::io::DataOutputStream::writeShort (short value) throw (IOException) [virtual]`

Writes a short to the underlying output stream as two bytes, high byte first. If no exception is thrown, the counter written is incremented by 2.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477)

6.203.3.15 virtual void decaf::io::DataOutputStream::writeUnsignedShort (unsigned short *value*) throw (IOException) [virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value - unsigned short to write to the stream

Exceptions:

IOException (p. 1477)

6.203.3.16 virtual void decaf::io::DataOutputStream::writeUTF (const std::string & *value*) throw (IOException, UTFDataFormatException) [virtual]

Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes. The first two bytes written are indicate its encoded length followed by the rest of the string's characters encoded as modified UTF-8. The length represent the encoded length of the data not the actual length of the string.

Parameters:

value the value to write.

Exceptions:

IOException (p. 1477) - on a write error

UTFDataFormatException (p. 2683) - if encoded size if greater than 65535

6.203.4 Field Documentation**6.203.4.1** unsigned char decaf::io::DataOutputStream::buffer[8] [protected]**6.203.4.2** std::size_t decaf::io::DataOutputStream::written [protected]

The documentation for this class was generated from the following file:

Protected Member Functions

- **DataResponse** (const **DataResponse** &)
- **DataResponse** & operator= (const **DataResponse** &)

Protected Attributes

- **Pointer**< **DataStructure** > data

6.204.1 Constructor & Destructor Documentation

6.204.1.1 `activemq::commands::DataResponse::DataResponse (const DataResponse &) [inline, protected]`

6.204.1.2 `activemq::commands::DataResponse::DataResponse ()`

6.204.1.3 `virtual activemq::commands::DataResponse::~~DataResponse () [virtual]`

6.204.2 Member Function Documentation

6.204.2.1 `virtual DataResponse* activemq::commands::DataResponse::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::Response` (p. 2232).

6.204.2.2 `virtual void activemq::commands::DataResponse::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::Response` (p. 2232).

6.204.2.3 `virtual bool activemq::commands::DataResponse::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p. 2232).

- 6.204.2.4** `virtual Pointer<DataStructure>& activemq::commands::DataResponse::getData ()`
[virtual]
- 6.204.2.5** `virtual const Pointer<DataStructure>& activemq::commands::DataResponse::getData () const`
[virtual]
- 6.204.2.6** `virtual unsigned char activemq::commands::DataResponse::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from **activemq::commands::Response** (p. 2233).

- 6.204.2.7** `DataResponse& activemq::commands::DataResponse::operator= (const DataResponse &)` [inline, protected]

Reimplemented from **activemq::commands::Response** (p. 2233).

- 6.204.2.8** `virtual void activemq::commands::DataResponse::setData (const Pointer< DataStructure > & data)` [virtual]
- 6.204.2.9** `virtual std::string activemq::commands::DataResponse::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2233).

6.204.3 Field Documentation

6.205 activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1135).

#include <src/main/activemq/wireformat/openwire/marshal/v3/DataResponseMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller:

Public Member Functions

- **DataResponseMarshaller** ()
- virtual **~DataResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.205.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1135). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.205.2 Constructor & Destructor Documentation

6.205.2.1 `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::DataResponseMarshaller()` [inline]

6.205.2.2 `virtual activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::~~DataResponseMarshaller()` [inline, virtual]

6.205.3 Member Function Documentation

6.205.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.205.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaller.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.205.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.205.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2248).

6.205.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2248).

6.205.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2249).

6.205.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2250).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**DataResponseMarshaller.h**

6.206 activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1139).

Write a object instance to data output stream.

6.206.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1139). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.206.2 Constructor & Destructor Documentation

6.206.2.1 `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::DataResponseMarshaller()` [inline]

6.206.2.2 `virtual activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::~DataResponseMarshaller()` [inline, virtual]

6.206.3 Member Function Documentation

6.206.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.206.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaller.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.206.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2252).

6.206.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2253).

6.206.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2253).

6.206.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2254).

6.206.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2255).

The documentation for this class was generated from the following file:

6.207.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1143). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.207.2 Constructor & Destructor Documentation

6.207.2.1 `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::DataResponseMarshaller()` [inline]

6.207.2.2 `virtual activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::~~DataResponseMarshaller()` [inline, virtual]

6.207.3 Member Function Documentation

6.207.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.207.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaller.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.207.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.207.3.4 virtual void `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.207.3.5 virtual int `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.207.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2244).

6.207.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2245).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**DataResponseMarshaller.h**

6.208 activemq::wireformat::openwire::marshal::DataStreamMarshaller Class Reference

Base class for all classes that **marshal** (p. 76) **commands** (p. 59) for Openwire.

#include <src/main/activemq/wireformat/openwire/marshal/DataStreamMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::DataStreamMarshaller:

Public Member Functions

- virtual **~DataStreamMarshaller** ()
- virtual unsigned char **getDataStructureType** () const =0
Gets the DataStructureType that this class marshals/unmarshals.
- virtual **commands::DataStructure * createObject** () const =0
Creates a new instance of the class that this class is a marshaling director for.
- virtual int **tightMarshal1** (**OpenWireFormat** *format, **commands::DataStructure** *command, **utils::BooleanStream** *bs)=0 throw (**decaf::io::IOException**)
Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs)=0 throw (**decaf::io::IOException**)
Tight Marhsal to the given stream.
- virtual void **tightUnmarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataInputStream** *dis, **utils::BooleanStream** *bs)=0 throw (**decaf::io::IOException**)
Tight Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataOutputStream** *ds)=0 throw (**decaf::io::IOException**)
Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *format, **commands::DataStructure** *command, **decaf::io::DataInputStream** *dis)=0 throw (**decaf::io::IOException**)
Loose Un-marhsal to the given stream.

6.208.1 Detailed Description

Base class for all classes that **marshal** (p. 76) **commands** (p. 59) for Openwire.

6.208.2 Constructor & Destructor Documentation

6.208.2.1 `virtual`
`activemq::wireformat::openwire::marshal::DataStreamMarshaller::~~DataStreamMarshaller`
`() [inline, virtual]`

6.208.3 Member Function Documentation

6.208.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::DataStreamMarshaller::createObject`
`() const [pure virtual]`

Creates a new instance of the class that this class is a marshaling director for.

Returns:

newly allocated Command

Implemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 156), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 183), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 272), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 287), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 318), `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 346), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 392), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 425), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 442), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 458), `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 474), `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 600), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 620), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 955), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 971), `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 990), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1008), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1038), `activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller` (p. 1055), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1075), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1088), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1109), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1140), `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1204), `activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller` (p. 1222), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1284), `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 1361), `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1450), `activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller` (p. 1500), `activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller` (p. 1521), `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller` (p. 1536), `activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller` (p. 1552), `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller` (p. 1567), `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 1583), `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1613), `activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller`

6.208.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::DataStreamMarshaller::getDataStructureType() () const [pure virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implemented in activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller
 (p. 156), activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller
 (p. 183), activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller
 (p. 272), activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller
 (p. 287), activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller
 (p. 318), activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller
 (p. 346), activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller
 (p. 392), activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller
 (p. 425), activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller
 (p. 442), activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller

6.208.3.3 virtual void ac-
ativemq::wireformat::openwire::marshal::DataStreamMarshaller::looseMarshal
(OpenWireFormat * *format*, commands::DataStructure * *command*,
decaf::io::DataOutputStream * *ds*) throw (decaf::io::IOException)
[pure virtual]

Tight Marshal to the given stream.

Parameters:

format - The OpenWireFormat properties
command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 76) to

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 156), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 183), **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 245), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 272), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 287), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 318), **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 346), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 408), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 425), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 442), **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 458), **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 474), **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 522), **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller** (p. 600), **activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller** (p. 620), **activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller** (p. 955), **activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller** (p. 971), **activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller** (p. 990), **activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller** (p. 1008), **activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller** (p. 1038), **activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller** (p. 1055), **activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller** (p. 1075), **activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller** (p. 1088), **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1109), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1140), **activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller** (p. 1204), **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller** (p. 1222), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1284), **activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller** (p. 1361), **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1450), **activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller** (p. 1500), **activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller** (p. 1521), **activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller** (p. 1536), **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller** (p. 1552), **activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller** (p. 1567), **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 1583), **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 1613), **activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller** (p. 1792), **activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller** (p. 1820), **activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller** (p. 1834), **activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller** (p. 1849), **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1872), **activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller** (p. 1907), **activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller** (p. 1936), **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2008), **activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller** (p. 2095), **activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller** (p. 2119),

6.208.3.5 `virtual int activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs) throw (decaf::io::IOException) [pure virtual]`

Tight Marshal to the given stream.

Parameters:

format - The OpenWireFormat properties
command - the object to Marshal
bs - boolean stream to `marshal` (p. 76) to.

Exceptions:

IOException if an error occurs.

Implemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 157), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 246), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 273), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 288), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 319), `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 347), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 393), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 409), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 426), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 443), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 459), `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 475), `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524), `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 601), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 621), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 956), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 972), `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 991), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1009),

6.208.3.6 virtual void `activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal2` (`OpenWireFormat * format`, `commands::DataStructure * command`, `decaf::io::DataOutputStream * ds`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [pure virtual]

Tight Marshal to the given stream.

Parameters:

format - The `OpenWireFormat` properties
command - the object to Marshal
ds - the `DataOutputStream` to Marshal to
bs - boolean stream to `marshal` (p. 76) to.

Exceptions:

IOException if an error occurs.

6.208.3.7 virtual void ac-

tivemq::wireformat::openwire::marshal::DataStreamMarshaller::tightUnmarshal
 (OpenWireFormat * *format*, commands::DataStructure * *command*,
 decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) throw (
 decaf::io::IOException) [pure virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties
command - the object to Un-Marshall
dis - the DataInputStream to Un-Marshall from
bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

- `src/main/activemq/wireformat/openwire/marshal/DataStreamMarshaller.h`

6.209 activemq::commands::DataStructure Class Reference

#include <src/main/activemq/commands/DataStructure.h> Inheritance diagram for activemq::commands::DataStructure:

Public Member Functions

- virtual **~DataStructure** ()
- virtual unsigned char **getDataStructureType** () const =0
*Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.*
- virtual **DataStructure * cloneDataStructure** () const =0
Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)=0
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const =0
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const =0
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*

6.209.1 Constructor & Destructor Documentation

- 6.209.1.1** virtual activemq::commands::DataStructure::~~DataStructure ()
 [inline, virtual]

6.209.2 Member Function Documentation

- 6.209.2.1** virtual **DataStructure*** **activemq::commands::DataStructure::cloneDataStructure** ()
 const [pure virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 147), **activemq::commands::ActiveMQBytesMessage** (p. 166), **activemq::commands::ActiveMQDestination** (p. 231), **activemq::commands::ActiveMQMapMessage** (p. 258), **activemq::commands::ActiveMQMessage** (p. 280), **activemq::commands::ActiveMQObjectMessage**

`tivemq::commands::XATransactionId` (p. 2732).

6.209.2.2 virtual void `activemq::commands::DataStructure::copyDataStructure` (const `DataStructure * src`) [pure virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

`src` - Source Object

6.209.2.3 virtual bool activemq::commands::DataStructure::equals (const DataStructure * *value*) const [pure virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.209.2.4 virtual unsigned char activemq::commands::DataStructure::getDataStructureType () const [pure virtual]

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 148), **activemq::commands::ActiveMQBytesMessage** (p. 168), **activemq::commands::ActiveMQDestination** (p. 233), **activemq::commands::ActiveMQMapMessage** (p. 260), **activemq::commands::ActiveMQMessage** (p. 280), **activemq::commands::ActiveMQObjectMessage** (p. 312), **activemq::commands::ActiveMQQueue** (p. 339), **activemq::commands::ActiveMQStreamMessage** (p. 377), **activemq::commands::ActiveMQTempDestination** (p. 401), **activemq::commands::ActiveMQTempQueue** (p. 418), **activemq::commands::ActiveMQTempTopic** (p. 435), **activemq::commands::ActiveMQTextMessage** (p. 451), **activemq::commands::ActiveMQTopic** (p. 467), **activemq::commands::BrokerError** (p. 588), **activemq::commands::BrokerId** (p. 594), **activemq::commands::BrokerInfo** (p. 610), **activemq::commands::ConnectionControl** (p. 947), **activemq::commands::ConnectionError** (p. 964), **activemq::commands::ConnectionId** (p. 983), **activemq::commands::ConnectionInfo** (p. 999), **activemq::commands::ConsumerControl** (p. 1030), **activemq::commands::ConsumerId** (p. 1047), **activemq::commands::ConsumerInfo** (p. 1065), **activemq::commands::ControlCommand** (p. 1085), **activemq::commands::DataArrayResponse** (p. 1103), **activemq::commands::DataResponse** (p. 1134), **activemq::commands::DestinationInfo** (p. 1196), **activemq::commands::DiscoveryEvent** (p. 1215), **activemq::commands::ExceptionResponse** (p. 1277), **activemq::commands::FlushCommand** (p. 1358), **activemq::commands::IntegerResponse** (p. 1443), **activemq::commands::JournalQueueAck** (p. 1492), **activemq::commands::JournalTopicAck** (p. 1509), **activemq::commands::JournalTrace** (p. 1525), **activemq::commands::JournalTransaction** (p. 1541), **activemq::commands::KeepAliveInfo** (p. 1556), **activemq::commands::LastPartialCommand** (p. 1577), **activemq::commands::LocalTransactionId** (p. 1602), **activemq::commands::Message** (p. 1743), **activemq::commands::MessageAck** (p. 1779), **activemq::commands::MessageDispatch** (p. 1802), **activemq::commands::MessageDispatchNotification** (p. 1825), **activemq::commands::MessageId** (p. 1845), **activemq::commands::MessagePull**

(p. 1895), **activemq::commands::NetworkBridgeFilter** (p. 1925), **activemq::commands::PartialCommand** (p. 1997), **activemq::commands::ProducerAck** (p. 2088), **activemq::commands::ProducerId** (p. 2107), **activemq::commands::ProducerInfo** (p. 2124), **activemq::commands::RemoveInfo** (p. 2178), **activemq::commands::RemoveSubscriptionInfo** (p. 2195), **activemq::commands::ReplayCommand** (p. 2212), **activemq::commands::Response** (p. 2233), **activemq::commands::SessionId** (p. 2286), **activemq::commands::SessionInfo** (p. 2302), **activemq::commands::ShutdownInfo** (p. 2350), **activemq::commands::SubscriptionInfo** (p. 2493), **activemq::commands::TransactionId** (p. 2575), **activemq::commands::TransactionInfo** (p. 2591), **activemq::commands::WireFormatInfo** (p. 2703), and **activemq::commands::XATransactionId** (p. 2733).

6.209.2.5 virtual std::string activemq::commands::DataStructure::toString () const [pure virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 150), **activemq::commands::ActiveMQBytesMessage** (p. 173), **activemq::commands::ActiveMQDestination** (p. 237), **activemq::commands::ActiveMQMapMessage** (p. 266), **activemq::commands::ActiveMQMessage** (p. 281), **activemq::commands::ActiveMQObjectMessage** (p. 312), **activemq::commands::ActiveMQQueue** (p. 340), **activemq::commands::ActiveMQStreamMessage** (p. 382), **activemq::commands::ActiveMQTempDestination** (p. 401), **activemq::commands::ActiveMQTempQueue** (p. 418), **activemq::commands::ActiveMQTempTopic** (p. 435), **activemq::commands::ActiveMQTextMessage** (p. 452), **activemq::commands::ActiveMQTopic** (p. 468), **activemq::commands::BaseCommand** (p. 512), **activemq::commands::BaseDataStructure** (p. 560), **activemq::commands::BooleanExpression** (p. 579), **activemq::commands::BrokerId** (p. 594), **activemq::commands::BrokerInfo** (p. 612), **activemq::commands::Command** (p. 883), **activemq::commands::ConnectionControl** (p. 948), **activemq::commands::ConnectionError** (p. 964), **activemq::commands::ConnectionId** (p. 983), **activemq::commands::ConnectionInfo** (p. 1001), **activemq::commands::ConsumerControl** (p. 1031), **activemq::commands::ConsumerId** (p. 1048), **activemq::commands::ConsumerInfo** (p. 1067), **activemq::commands::ControlCommand** (p. 1085), **activemq::commands::DataArrayResponse** (p. 1103), **activemq::commands::DataResponse** (p. 1134), **activemq::commands::DestinationInfo** (p. 1197), **activemq::commands::DiscoveryEvent** (p. 1215), **activemq::commands::ExceptionResponse** (p. 1278), **activemq::commands::FlushCommand** (p. 1359), **activemq::commands::IntegerResponse** (p. 1444), **activemq::commands::JournalQueueAck** (p. 1493), **activemq::commands::JournalTopicAck** (p. 1510), **activemq::commands::JournalTrace** (p. 1526), **activemq::commands::JournalTransaction** (p. 1541), **activemq::commands::KeepAliveInfo** (p. 1557), **activemq::commands::LastPartialCommand** (p. 1577), **activemq::commands::LocalTransactionId** (p. 1603), **activemq::commands::Message** (p. 1749), **activemq::commands::MessageAck**

(p. 1781), `activemq::commands::MessageDispatch` (p. 1803), `activemq::commands::MessageDispatchNotification` (p. 1827), `activemq::commands::MessageId` (p. 1846), `activemq::commands::MessagePull` (p. 1896), `activemq::commands::NetworkBridgeFilter` (p. 1926), `activemq::commands::PartialCommand` (p. 1997), `activemq::commands::ProducerAck` (p. 2088), `activemq::commands::ProducerId` (p. 2108), `activemq::commands::ProducerInfo` (p. 2125), `activemq::commands::RemoveInfo` (p. 2179), `activemq::commands::RemoveSubscriptionInfo` (p. 2196), `activemq::commands::ReplayCommand` (p. 2212), `activemq::commands::Response` (p. 2233), `activemq::commands::SessionId` (p. 2287), `activemq::commands::SessionInfo` (p. 2302), `activemq::commands::ShutdownInfo` (p. 2351), `activemq::commands::SubscriptionInfo` (p. 2494), `activemq::commands::TransactionId` (p. 2575), `activemq::commands::TransactionInfo` (p. 2592), `activemq::commands::WireFormatInfo` (p. 2708), and `activemq::commands::XATransactionId` (p. 2734).

The documentation for this class was generated from the following file:

6.210 decaf::util::Date Class Reference

Wrapper class around a time value in milliseconds.

```
#include <src/main/decaf/util/Date.h>
```

Public Member Functions

- **Date** ()
Default constructor - sets time to now.
- **Date** (long long milliseconds)
Constructs the date with a given time value.
- **Date** (const **Date** &source)
Copy constructor.
- virtual ~**Date** ()
- long long **getTime** () const
Gets the underlying time.
- void **setTime** (long long milliseconds)
Sets the underlying time.
- bool **after** (**Date** &when) const
Determines whether or not this date falls after the specified time.
- bool **before** (**Date** &when) const
Determines whether or not this date falls before the specified time.
- bool **equals** (**Date** &when) const
Determines whether or not this date is equal to the specified time.
- **Date** & **operator=** (const **Date** &source)
Assignment operator.

Static Public Member Functions

- static long long **getCurrentTimeMilliseconds** ()
Returns the current time in milliseconds.

6.210.1 Detailed Description

Wrapper class around a time value in milliseconds. This class is comparable to Java's java.util.Date class.

Since:

1.0

6.210.2 Constructor & Destructor Documentation

6.210.2.1 `decaf::util::Date::Date ()`

Default constructor - sets time to now.

6.210.2.2 `decaf::util::Date::Date (long long milliseconds)`

Constructs the date with a given time value.

Parameters:

milliseconds The time in milliseconds;

6.210.2.3 `decaf::util::Date::Date (const Date & source)`

Copy constructor.

Parameters:

source The **Date** (p. 1179) instance to copy into this one.

6.210.2.4 `virtual decaf::util::Date::~~Date ()` [virtual]

6.210.3 Member Function Documentation

6.210.3.1 `bool decaf::util::Date::after (Date & when) const` [inline]

Determines wether or not this date falls after the specified time.

Parameters:

when The date to compare

Returns:

true if this date falls after when.

6.210.3.2 `bool decaf::util::Date::before (Date & when) const` [inline]

Determines wether or not this date falls before the specified time.

Parameters:

when The date to compare

Returns:

true if this date falls before when.

6.210.3.3 `bool decaf::util::Date::equals (Date & when) const` [inline]

Determines whether or not this date is equal to the specified time.

Parameters:

when The date to compare

Returns:

true if this date is equal to when.

6.210.3.4 `static long long decaf::util::Date::getCurrentTimeMilliseconds ()`
[static]

Returns the current time in milliseconds. Comparable to Java's System.currentTimeMillis method.

Returns:

The current time in milliseconds.

Referenced by activemq::commands::Message::isExpired().

6.210.3.5 `long long decaf::util::Date::getTime () const` [inline]

Gets the underlying time.

Returns:

The underlying time value in milliseconds.

6.210.3.6 `Date& decaf::util::Date::operator= (const Date & source)` [inline]

Assignment operator.

6.210.3.7 `void decaf::util::Date::setTime (long long milliseconds)` [inline]

Sets the underlying time.

Parameters:

milliseconds The underlying time value in milliseconds.

The documentation for this class was generated from the following file:

6.211 decaf::internal::DecafRuntime Class Reference

Handles APR initialization and termination.

#include <src/main/decaf/internal/DecafRuntime.h> Inheritance diagram for decaf::internal::DecafRuntime:

Public Member Functions

- **DecafRuntime ()**
Initializes the APR Runtime for a library.
- virtual **~DecafRuntime ()**
Terminates the APR Runtime for a library.
- apr_pool_t * **getGlobalPool () const**
Grants access to the Global APR Pool instance that should be used when creating new threads.

6.211.1 Detailed Description

Handles APR initialization and termination.

6.211.2 Constructor & Destructor Documentation

6.211.2.1 decaf::internal::DecafRuntime::DecafRuntime ()

Initializes the APR Runtime for a library.

6.211.2.2 virtual decaf::internal::DecafRuntime::~~DecafRuntime () [virtual]

Terminates the APR Runtime for a library.

6.211.3 Member Function Documentation

6.211.3.1 apr_pool_t* decaf::internal::DecafRuntime::getGlobalPool () const

Grants access to the Global APR Pool instance that should be used when creating new threads.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**DecafRuntime.h**

6.212 activemq::threads::DedicatedTaskRunner Class Reference

#include <src/main/activemq/threads/DedicatedTaskRunner.h> Inheritance diagram for activemq::threads::DedicatedTaskRunner:

Public Member Functions

- **DedicatedTaskRunner** (**Task** *task)
- virtual **~DedicatedTaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

- virtual void **shutdown** ()

Shutdown once the task has finished and the TaskRunner's thread has exited.

- virtual void **wakeup** ()

*Signal the **TaskRunner** (p. 2522) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2520) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()

Run method - called by the Thread class in the context of the thread.

6.212.1 Constructor & Destructor Documentation

6.212.1.1 **activemq::threads::DedicatedTaskRunner::DedicatedTaskRunner** (**Task** *task)

6.212.1.2 **virtual activemq::threads::DedicatedTaskRunner::~~DedicatedTaskRunner** () [virtual]

6.212.2 Member Function Documentation

6.212.2.1 **virtual void activemq::threads::DedicatedTaskRunner::run** () [protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2256).

6.212.2.2 virtual void activemq::threads::DedicatedTaskRunner::shutdown ()
[virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implements **activemq::threads::TaskRunner** (p. 2522).

6.212.2.3 virtual void activemq::threads::DedicatedTaskRunner::shutdown
(unsigned int *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters:

timeout - Time in Milliseconds to wait for the task to stop.

Implements **activemq::threads::TaskRunner** (p. 2522).

6.212.2.4 virtual void activemq::threads::DedicatedTaskRunner::wakeup ()
[virtual]

Signal the **TaskRunner** (p. 2522) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2520) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 2523).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**DedicatedTaskRunner.h**

6.213 activemq::transport::DefaultTransportListener Class Reference

#include <src/main/activemq/transport/DefaultTransportListener.h> Inheritance diagram for activemq::transport::DefaultTransportListener:

Public Member Functions

- virtual **~DefaultTransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command *AMQCPP_*-*UNUSED*)
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex *AMQCPP_*-*UNUSED*)
*Event handler for an exception from a command **transport** (p. 67).*
- virtual void **transportInterrupted** ()
*The **transport** (p. 67) has suffered an interruption from which it hopes to recover.*
- virtual void **transportResumed** ()
*The **transport** (p. 67) has resumed after an interruption.*

6.213.1 Constructor & Destructor Documentation

- 6.213.1.1** virtual **activemq::transport::DefaultTransportListener::~~DefaultTransportListener** () [inline, virtual]

6.213.2 Member Function Documentation

- 6.213.2.1** virtual void **activemq::transport::DefaultTransportListener::onCommand** (const **Pointer**< **Command** > &command *AMQCPP_*-*UNUSED*) [inline, virtual]

Event handler for the receipt of a command. The **transport** (p. 67) passes off all received **commands** (p. 59) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2608) deletes the command upon receipt.

Parameters:

command the received command object.

- 6.213.2.2** virtual void **activemq::transport::DefaultTransportListener::onException** (const **decaf::lang::Exception** &ex *AMQCPP_*-*UNUSED*) [inline, virtual]

Event handler for an exception from a command **transport** (p. 67).

Parameters:

ex The exception.

6.213.2.3 `virtual void activemq::transport::DefaultTransportListener::transportInterrupted ()`
[inline, virtual]

The **transport** (p.67) has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p.2625).

6.213.2.4 `virtual void activemq::transport::DefaultTransportListener::transportResumed ()`
[inline, virtual]

The **transport** (p.67) has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p.2625).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/DefaultTransportListener.h`

6.214 decaf::util::concurrent::Delayed Class Reference

A mix-in style interface for marking objects that should be acted upon after a given delay.

#include <src/main/decaf/util/concurrent/Delayed.h> Inheritance diagram for decaf::util::concurrent::Delayed:

Public Member Functions

- virtual `~Delayed()`
- virtual long long `getDelay` (const `TimeUnit` &unit)=0

Returns the remaining delay associated with this object, in the given time unit.

6.214.1 Detailed Description

A mix-in style interface for marking objects that should be acted upon after a given delay. An implementation of this interface must define a `Comparable` methods that provides an ordering consistent with its `getDelay` method.

6.214.2 Constructor & Destructor Documentation

6.214.2.1 virtual `decaf::util::concurrent::Delayed::~~Delayed()` [inline, virtual]

6.214.3 Member Function Documentation

6.214.3.1 virtual long long `decaf::util::concurrent::Delayed::getDelay` (const `TimeUnit` & *unit*) [pure virtual]

Returns the remaining delay associated with this object, in the given time unit.

Parameters:

unit The time unit

Returns:

the remaining delay; zero or negative values indicate that the delay has already elapsed

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Delayed.h`

6.215 cms::DeliveryMode Class Reference

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

```
#include <src/main/cms/DeliveryMode.h>
```

Public Member Functions

- virtual `~DeliveryMode ()`

Static Public Attributes

- static const int **PERSISTENT** = 0
*Enumeration values for **Message** (p. 1753) Delivery Mode.*
- static const int **NON_PERSISTENT** = 1

6.215.1 Detailed Description

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages. When a client sends a `cms::Message` (p.1753) it can mark the **Message** (p.1753) as either Persistent or Non-Persistent. If the client feels that the **Message** (p.1753) cannot be lost in transit it should mark it as Persistent, otherwise if it is allowable for a **Message** (p.1753) to occasionally be lost it can mark it as Non-Persistent. This allows the Provider to balance make tradeoffs between balance and **Message** (p.1753) throughput.

The **DeliveryMode** (p.1188) covers only the transport of the **Message** (p.1753) for sending client to its destination and doesn't apply to the receiving **Message** (p.1753) consumer. The receiving Consumer can drop Message's based on configuration such as memory limits or **Message** (p.1753) filtering.

A message is guaranteed to be delivered once and only once by a CMS provider if the delivery mode of the message is **PERSISTENT** and the configuration of the **Message** (p.1753) consumer allows for it.

Since:

1.0

6.215.2 Constructor & Destructor Documentation

6.215.2.1 `virtual cms::DeliveryMode::~~DeliveryMode () [inline, virtual]`

6.215.3 Field Documentation

6.215.3.1 `const int cms::DeliveryMode::NON_PERSISTENT = 1 [static]`

6.215.3.2 `const int cms::DeliveryMode::PERSISTENT = 0 [static]`

Enumeration values for **Message** (p. 1753) Delivery Mode.

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setCMSDeliveryMode().

The documentation for this class was generated from the following file:

- src/main/cms/**DeliveryMode.h**

6.216 cms::Destination Class Reference

A **Destination** (p. 1190) object encapsulates a provider-specific address.

#include <src/main/cms/Destination.h> Inheritance diagram for cms::Destination:

Public Types

- enum **DestinationType** { **TOPIC**, **QUEUE**, **TEMPORARY_TOPIC**, **TEMPORARY_QUEUE** }

Public Member Functions

- virtual **~Destination** ()
- virtual **DestinationType** **getDestinationType** () const =0
*Retrieve the **Destination** (p. 1190) Type for this **Destination** (p. 1190).*
- virtual **cms::Destination * clone** () const =0
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const **cms::Destination** &source)=0
*Copies the contents of the given **Destination** (p. 1190) object to this one.*
- virtual const **CMSProperties** & **getCMSProperties** () const =0
Retrieve any properties that might be part of the destination that was specified.

6.216.1 Detailed Description

A **Destination** (p. 1190) object encapsulates a provider-specific address. There is no standard definition of a **Destination** (p. 1190) address, each provider can provide its own definition and there can be configuration data attached to the **Destination** (p. 1190) address.

All CMS **Destination** (p. 1190) objects support concurrent use.

Since:

1.0

6.216.2 Member Enumeration Documentation

6.216.2.1 enum cms::Destination::DestinationType

Enumerator:

TOPIC
QUEUE
TEMPORARY_TOPIC
TEMPORARY_QUEUE

6.216.3 Constructor & Destructor Documentation

6.216.3.1 `virtual cms::Destination::~~Destination () [inline, virtual]`

6.216.4 Member Function Documentation

6.216.4.1 `virtual cms::Destination* cms::Destination::clone () const [pure virtual]`

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implemented in `activemq::commands::ActiveMQQueue` (p. 338),
`activemq::commands::ActiveMQTempQueue` (p. 416), `ac-`
`tivemq::commands::ActiveMQTempTopic` (p. 433), and `ac-`
`tivemq::commands::ActiveMQTopic` (p. 466).

6.216.4.2 `virtual void cms::Destination::copy (const cms::Destination & source) [pure virtual]`

Copies the contents of the given **Destination** (p. 1190) object to this one.

Parameters:

source The source **Destination** (p. 1190) object.

6.216.4.3 `virtual const CMSProperties& cms::Destination::getCMSProperties () const [pure virtual]`

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

A {const} reference to a **CMSProperties** (p. 853) object.

Implemented in `activemq::commands::ActiveMQQueue` (p. 339),
`activemq::commands::ActiveMQTempQueue` (p. 417), `ac-`
`tivemq::commands::ActiveMQTempTopic` (p. 434), and `ac-`
`tivemq::commands::ActiveMQTopic` (p. 467).

6.216.4.4 `virtual DestinationType cms::Destination::getDestinationType () const [pure virtual]`

Retrieve the **Destination** (p. 1190) Type for this **Destination** (p. 1190).

Returns:

The **Destination** (p. 1190) Type

Implemented in `activemq::commands::ActiveMQQueue` (p. 339),
`activemq::commands::ActiveMQTempQueue` (p. 418), `ac-`
`tivemq::commands::ActiveMQTempTopic` (p. 435), and `ac-`
`tivemq::commands::ActiveMQTopic` (p. 467).

The documentation for this class was generated from the following file:

#include <src/main/activemq/commands/DestinationInfo.h> Inheritance diagram for activemq::commands::DestinationInfo:

Public Member Functions

- **DestinationInfo** ()
- virtual **~DestinationInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DestinationInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()

- unsigned char **operationType**
- long long **timeout**
- std::vector< **decaf::lang::Pointer**< **BrokerId** > > **brokerPath**

6.218.1 Constructor & Destructor Documentation

6.218.1.1 **activemq::commands::DestinationInfo::DestinationInfo** (const **DestinationInfo** &) [inline, protected]

6.218.1.2 **activemq::commands::DestinationInfo::DestinationInfo** ()

6.218.1.3 **virtual** **activemq::commands::DestinationInfo::~~DestinationInfo** () [virtual]

6.218.2 Member Function Documentation

6.218.2.1 **virtual** **DestinationInfo*** **activemq::commands::DestinationInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

6.218.2.2 **virtual** **void** **activemq::commands::DestinationInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.218.2.3 `virtual bool activemq::commands::DestinationInfo::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.218.2.4 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath ()` [virtual]

6.218.2.5 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath () const` [virtual]

6.218.2.6 `virtual Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId ()` [virtual]

6.218.2.7 `virtual const Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId () const` [virtual]

6.218.2.8 `virtual unsigned char activemq::commands::DestinationInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.218.2.9 `virtual Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination ()`
[virtual]
- 6.218.2.10 `virtual const Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination () const`
[virtual]
- 6.218.2.11 `virtual unsigned char activemq::commands::DestinationInfo::getOperationType ()`
const [virtual]
- 6.218.2.12 `virtual long long activemq::commands::DestinationInfo::getTimeout ()`
const [virtual]
- 6.218.2.13 `DestinationInfo& activemq::commands::DestinationInfo::operator=`
(const DestinationInfo &) [inline, protected]
- 6.218.2.14 `virtual void activemq::commands::DestinationInfo::setBrokerPath`
(const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*)
[virtual]
- 6.218.2.15 `virtual void activemq::commands::DestinationInfo::setConnectionId`
(const Pointer< ConnectionId > & *connectionId*) [virtual]
- 6.218.2.16 `virtual void activemq::commands::DestinationInfo::setDestination`
(const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.218.2.17 `virtual void activemq::commands::DestinationInfo::setOperationType`
(unsigned char *operationType*) [virtual]
- 6.218.2.18 `virtual void activemq::commands::DestinationInfo::setTimeout (long`
long *timeout*) [virtual]
- 6.218.2.19 `virtual std::string activemq::commands::DestinationInfo::toString ()`
const [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

- 6.218.2.20 `virtual Pointer<Command> activemq::commands::DestinationInfo::visit`
(activemq::state::CommandVisitor * *visitor*) throw (
exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.218.3 Field Documentation

- 6.218.3.1** `std::vector< decaf::lang::Pointer<BrokerId> >`
`activemq::commands::DestinationInfo::brokerPath` [protected]

Write a object instance to data output stream.

6.219.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1199). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.219.2 Constructor & Destructor Documentation

6.219.2.1 `activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::DestinationInfoM`
`() [inline]`

6.219.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::~~DestinationInfoM`
`() [inline, virtual]`

6.219.3 Member Function Documentation

6.219.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.219.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.219.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.219.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.219.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.219.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.219.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**DestinationInfoMarshaller.h**

6.220 activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller Class Reference

6.220.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1203). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.220.2 Constructor & Destructor Documentation

6.220.2.1 `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::DestinationInfoM`
`() [inline]`

6.220.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::~~DestinationInfoM`
`() [inline, virtual]`

6.220.3 Member Function Documentation

6.220.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.220.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.220.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.220.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.220.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.220.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.220.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.221.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1207). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.221.2 Constructor & Destructor Documentation

6.221.2.1 `activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::DestinationInfoMarshaller()` [inline]

6.221.2.2 `virtual activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::~~DestinationInfoMarshaller()` [inline, virtual]

6.221.3 Member Function Documentation

6.221.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.221.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.221.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 529).

6.221.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 530).

6.221.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 531).

6.221.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.221.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**DestinationInfoMarshaller.h**

6.222 activemq::cmsutil::DestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

#include <src/main/activemq/cmsutil/DestinationResolver.h> Inheritance diagram for `activemq::cmsutil::DestinationResolver`:

Public Member Functions

- virtual `~DestinationResolver()`
- virtual void `init(ResourceLifecycleManager *mgr)=0`
Initializes this destination resolver for use.
- virtual void `destroy()`=0
Destroys any allocated resources.
- virtual `cms::Destination * resolveDestinationName(cms::Session *session, const std::string &destName, bool pubSubDomain)=0` throw (`cms::CMSException`)
Resolves the given name to a destination.

6.222.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.222.2 Constructor & Destructor Documentation

- 6.222.2.1** virtual `activemq::cmsutil::DestinationResolver::~~DestinationResolver()` [inline, virtual]

6.222.3 Member Function Documentation

- 6.222.3.1** virtual void `activemq::cmsutil::DestinationResolver::destroy()` [pure virtual]

Destroys any allocated resources.

Implemented in `activemq::cmsutil::DynamicDestinationResolver` (p. 1262).

- 6.222.3.2** virtual void `activemq::cmsutil::DestinationResolver::init(ResourceLifecycleManager *mgr)` [pure virtual]

Initializes this destination resolver for use. Ensures that any previously allocated resources are first destroyed (e.g. calls `destroy()` (p. 1211)).

Parameters:

mgr the resource lifecycle manager.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1263).

6.222.3.3 **virtual cms::Destination*** **activemq::cmsutil::DestinationResolver::resolveDestinationName**
(**cms::Session** * *session*, **const std::string &** *destName*, **bool** *pubSubDomain*) **throw (cms::CMSException)** [pure virtual]

Resolves the given name to a destination. If *pubSubDomain* is true, a topic will be returned, otherwise a queue will be returned.

Parameters:

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns:

the resolved destination

Exceptions:

cms::CMSException (p. 850) if resolution failed.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1263).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/DestinationResolver.h`

6.223.1 Constructor & Destructor Documentation

6.223.1.1 `activemq::commands::DiscoveryEvent::DiscoveryEvent (const DiscoveryEvent &) [inline, protected]`

6.223.1.2 `activemq::commands::DiscoveryEvent::DiscoveryEvent ()`

6.223.1.3 `virtual activemq::commands::DiscoveryEvent::~~DiscoveryEvent () [virtual]`

6.223.2 Member Function Documentation

6.223.2.1 `virtual DiscoveryEvent* activemq::commands::DiscoveryEvent::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.223.2.2 `virtual void activemq::commands::DiscoveryEvent::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.223.2.3 `virtual bool activemq::commands::DiscoveryEvent::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

- 6.223.2.4 virtual std::string& activemq::commands::DiscoveryEvent::getBrokerName ()
[virtual]
- 6.223.2.5 virtual const std::string& activemq::commands::DiscoveryEvent::getBrokerName ()
const [virtual]
- 6.223.2.6 virtual unsigned char activemq::commands::DiscoveryEvent::getDataStructureType () const
[virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

- 6.223.2.7 virtual std::string& activemq::commands::DiscoveryEvent::getServiceName ()
[virtual]
- 6.223.2.8 virtual const std::string& activemq::commands::DiscoveryEvent::getServiceName ()
const [virtual]
- 6.223.2.9 DataSet& activemq::commands::DiscoveryEvent::operator=
(const DataSet &) [inline, protected]
- 6.223.2.10 virtual void activemq::commands::DiscoveryEvent::setBrokerName
(const std::string & *brokerName*) [virtual]
- 6.223.2.11 virtual void activemq::commands::DiscoveryEvent::setServiceName
(const std::string & *serviceName*) [virtual]
- 6.223.2.12 virtual std::string activemq::commands::DiscoveryEvent::toString ()
const [virtual]

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 560).

6.223.3 Field Documentation

Write a object instance to data output stream.

6.224.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1217). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.224.2 Constructor & Destructor Documentation

6.224.2.1 `activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::DiscoveryEventM`
`() [inline]`

6.224.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::~~DiscoveryEvent`
`() [inline, virtual]`

6.224.3 Member Function Documentation

6.224.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.224.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.224.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.224.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.224.3.5 virtual int **activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - **BooleanStream** stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.224.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.224.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.225.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.225.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.225.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.225 activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller Class Reference 1223

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.225.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.225.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.225.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.225.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.226.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.226.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.226.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.226.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.226.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - **BooleanStream** stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.226.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.226.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const

Answers the long value which the receiver represents.

- `bool isInfinite () const`
- `bool isNaN () const`

Static Public Member Functions

- `static int compare (double d1, double d2)`
Compares the two specified double values.
- `static long long doubleToLongBits (double value)`
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.
- `static long long doubleToRawLongBits (double value)`
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.
- `static bool isInfinite (double value)`
- `static bool isNaN (double value)`
- `static double longBitsToDouble (long long bits)`
Returns the double value corresponding to a given bit representation.
- `static double parseDouble (const std::string &value) throw (exceptions::NumberFormatException)`
*Returns a new double initialized to the value represented by the specified string, as performed by the `valueOf` method of class **Double** (p. 1231).*
- `static std::string toHexString (double value)`
Returns a hexadecimal string representation of the double argument.
- `static std::string toString (double value)`
Returns a string representation of the double argument.
- `static Double valueOf (double value)`
*Returns a **Double** (p. 1231) instance representing the specified double value.*
- `static Double valueOf (const std::string &value) throw (exceptions::NumberFormatException)`
*Returns a **Double** (p. 1231) instance that wraps a primitive double which is parsed from the string value passed.*

Static Public Attributes

- `static const int SIZE = 64`
The size in bits of the primitive int type.
- `static const double MAX_VALUE`
The maximum value that the primitive type can hold.

- static const double **MIN_VALUE**
The minimum value that the primitive type can hold.
- static const double **NaN**
*Constant for the Not a **Number** (p. 1954) Value.*
- static const double **POSITIVE_INFINITY**
Constant for Positive Infinity.
- static const double **NEGATIVE_INFINITY**
Constant for Negative Infinity.

6.229.1 Constructor & Destructor Documentation

6.229.1.1 decaf::lang::Double::Double (double *value*)

Parameters:

value - the primitive type to wrap

6.229.1.2 decaf::lang::Double::Double (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value - the string to convert to a primitive type to wrap

6.229.1.3 virtual decaf::lang::Double::~~Double () [inline, virtual]

6.229.2 Member Function Documentation

6.229.2.1 virtual unsigned char decaf::lang::Double::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1954).

6.229.2.2 static int decaf::lang::Double::compare (double *d1*, double *d2*) [static]

Compares the two specified double values. The sign of the integer value returned is the same as that of the integer that would be returned by the call: new Double(d1).compareTo(new Double(d2))

Parameters:

d1 - the first double to compare

d2 - the second double to compare

Returns:

the value 0 if d1 is numerically equal to d2; a value less than 0 if d1 is numerically less than d2; and a value greater than 0 if d1 is numerically greater than d2.

6.229.2.3 `virtual int decaf::lang::Double::compareTo (const double & d) const`
[virtual]

Compares this **Double** (p. 1231) instance with another.

Parameters:

d - the **Double** (p. 1231) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **double** > (p. 899).

6.229.2.4 `virtual int decaf::lang::Double::compareTo (const Double & d) const`
[virtual]

Compares this **Double** (p. 1231) instance with another.

Parameters:

d - the **Double** (p. 1231) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.229.2.5 `static long long decaf::lang::Double::doubleToLongBits (double value)`
[static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout. Bit 63 (the bit that is selected by the mask 0x8000000000000000L) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000L. If the argument is negative infinity, the result is 0xfff0000000000000L. If the argument is NaN, the result is 0x7ff8000000000000L.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToLongBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters:

value - double to be converted

Returns:

the long long bits that make up the double

6.229.2.6 static long long decaf::lang::Double::doubleToRawLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values. Bit 63 (the bit that is selected by the mask 0x8000000000000000LL) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000LL. If the argument is negative infinity, the result is 0xfff0000000000000LL. If the argument is NaN, the result is the long integer representing the actual NaN value. Unlike the doubleToLongBits method, doubleToRawLongBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToRawLongBits.

Parameters:

value - double to be converted

Returns:

the long long bits that make up the double

6.229.2.7 virtual double decaf::lang::Double::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.229.2.8 `bool decaf::lang::Double::equals (const double & d) const` [inline, virtual]

Parameters:

d - the **Double** (p. 1231) object to compare against.

Returns:

true if the two **Double** (p. 1231) Objects have the same value.

Implements **decaf::lang::Comparable< double >** (p. 900).

6.229.2.9 `bool decaf::lang::Double::equals (const Double & d) const` [inline]

Parameters:

d - the **Double** (p. 1231) object to compare against.

Returns:

true if the two **Double** (p. 1231) Objects have the same value.

6.229.2.10 `virtual float decaf::lang::Double::floatValue () const` [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.229.2.11 `virtual int decaf::lang::Double::intValue () const` [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.229.2.12 `static bool decaf::lang::Double::isInfinite (double value)` [static]

Parameters:

value - The double to check.

Returns:

true if the double is equal to infinity.

6.229.2.13 **bool decaf::lang::Double::isInfinite () const****Returns:**

true if the double is equal to positive infinity.

6.229.2.14 **static bool decaf::lang::Double::isNaN (double *value*) [static]****Parameters:**

value - The double to check.

Returns:

true if the double is equal to NaN.

6.229.2.15 **bool decaf::lang::Double::isNaN () const****Returns:**

true if the double is equal to NaN.

6.229.2.16 **static double decaf::lang::Double::longBitsToDouble (long long *bits*) [static]**

Returns the double value corresponding to a given bit representation. The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "double format" bit layout.

If the argument is 0x7ff0000000000000L, the result is positive infinity. If the argument is 0xfff0000000000000L, the result is negative infinity. If the argument is any value in the range 0x7ff0000000000001L through 0x7fffffffffffffffL or in the range 0xfff0000000000001L through 0xfffffffffffffffL, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Double.doubleToRawLongBits** (p. 1235) method.

Parameters:

bits - the long long bits to convert to double

Returns:

the double converted from the bits

6.229.2.17 **virtual long long decaf::lang::Double::longValue () const [inline, virtual]**

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.229.2.18 `virtual bool decaf::lang::Double::operator< (const double & d) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< double >` (p. 900).

6.229.2.19 `virtual bool decaf::lang::Double::operator< (const Double & d) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.229.2.20 `virtual bool decaf::lang::Double::operator== (const double & d) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< double >` (p. 901).

6.229.2.21 `virtual bool decaf::lang::Double::operator== (const Double & d) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

**6.229.2.22 static double decaf::lang::Double::parseDouble (const std::string *value*)
throw (exceptions::NumberFormatException) [static]**

Returns a new double initialized to the value represented by the specified string, as performed by the `valueOf` method of class **Double** (p.1231).

Parameters:

value - The string to parse to an double

Returns:

a double parsed from the passed string

Exceptions:

NumberFormatException

6.229.2.23 virtual short decaf::lang::Double::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p.1956).

**6.229.2.24 static std::string decaf::lang::Double::toHexString (double *value*)
[static]**

Returns a hexadecimal string representation of the double argument. All characters mentioned below are ASCII characters.

* If the argument is NaN, the result is the string "NaN". * Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a double value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p.1440) on the exponent value. o If m is a double value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters:

value - The double to convert to a string

Returns:

the Hex formatted double string.

6.229.2.25 static std::string decaf::lang::Double::toString (double *value*) [static]

Returns a string representation of the double argument. All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10⁻³ but less than 10⁷, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10⁻³ or greater than or equal to 10⁷, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10ⁿ ≤ m < 10ⁿ⁺¹; then let a be the mathematically exact quotient of m and 10ⁿ so that 1 ≤ a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1440).

Parameters:

value - The double to convert to a string

Returns:

the formatted double string.

6.229.2.26 std::string decaf::lang::Double::toString () const**Returns:**

this **Double** (p. 1231) Object as a String Representation

6.229.2.27 static Double decaf::lang::Double::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Double** (p. 1231) instance that wraps a primitive double which is parsed from the string value passed.

Parameters:

value - the string to parse

Returns:

a new **Double** (p. 1231) instance wrapping the double parsed from value

Exceptions:

NumberFormatException on error.

6.229.2.28 static Double decaf::lang::Double::valueOf (double *value*) [static]

Returns a **Double** (p. 1231) instance representing the specified double value.

Parameters:

value - double to wrap

Returns:

new **Double** (p. 1231) instance wrapping the primitive value

6.229.3 Field Documentation**6.229.3.1 const double decaf::lang::Double::MAX_VALUE [static]**

The maximum value that the primitive type can hold.

6.229.3.2 const double decaf::lang::Double::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.229.3.3 const double decaf::lang::Double::NaN [static]

Constant for the Not a **Number** (p. 1954) Value.

6.229.3.4 const double decaf::lang::Double::NEGATIVE_INFINITY [static]

Constant for Negative Infinity.

6.229.3.5 const double decaf::lang::Double::POSITIVE_INFINITY [static]

Constant for Positive Infinity.

6.229.3.6 const int decaf::lang::Double::SIZE = 64 [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Double.h**

6.230 decaf::internal::nio::DoubleArrayBuffer Class Reference

#include <src/main/decaf/internal/nio/DoubleArrayBuffer.h> Inheritance diagram for decaf::internal::nio::DoubleArrayBuffer:

Public Member Functions

- **DoubleArrayBuffer** (std::size_t capacity, bool readOnly=false)
*Creates a **DoubleArrayBuffer** (p. 1242) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **DoubleArrayBuffer** (double *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)
*Creates a **DoubleArrayBuffer** (p. 1242) object that wraps the given array.*
- **DoubleArrayBuffer** (ByteArrayPerspective &array, std::size_t offset, std::size_t length, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset.*
- **DoubleArrayBuffer** (const DoubleArrayBuffer &other)
*Create a **DoubleArrayBuffer** (p. 1242) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.*
- virtual ~**DoubleArrayBuffer** ()
- virtual double * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the double array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual DoubleBuffer * **asReadOnlyBuffer** () const
Creates a new, read-only double buffer that shares this buffer's content.
- virtual DoubleBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)
Compacts this buffer.
- virtual DoubleBuffer * **duplicate** ()
Creates a new double buffer that shares this buffer's content.
- virtual double **get** () throw (decaf::nio::BufferUnderflowException)
Relative get method.

- virtual double **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual bool **hasArray** () const
Tells whether or not this buffer is backed by an accessible double array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual DoubleBuffer & **put** (double value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual DoubleBuffer & **put** (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the given index.
- virtual DoubleBuffer * **slice** () const
Creates a new DoubleBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this *ByteBuffer* (p. 694) as Read-Only.*

6.230.1 Constructor & Destructor Documentation

6.230.1.1 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **DoubleArrayBuffer** (p. 1242) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.230.1.2 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (double * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **DoubleArrayBuffer** (p. 1242) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap
offset - the position that is this buffers start pos.
capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.230.1.3 `decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t length, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset. The capacity and limit of the new **DoubleArrayBuffer** (p. 1242) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 729) to wrap
offset - the offset into array where the buffer starts
length - the length of the array we are wrapping or limit.
readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.230.1.4 `decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (const DoubleArrayBuffer & other)`

Create a **DoubleArrayBuffer** (p. 1242) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.

Parameters:

other - the **DoubleArrayBuffer** (p. 1242) this one is to mirror.

6.230.1.5 `virtual decaf::internal::nio::DoubleArrayBuffer::~~DoubleArrayBuffer () [virtual]`

6.230.2 Member Function Documentation

6.230.2.1 `virtual double* decaf::internal::nio::DoubleArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the double array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::DoubleBuffer` (p. 1253).

6.230.2.2 `virtual std::size_t decaf::internal::nio::DoubleArrayBuffer::arrayOffset
() throw (decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::DoubleBuffer` (p. 1253).

6.230.2.3 `virtual DoubleBuffer* de-
caf::internal::nio::DoubleArrayBuffer::asReadOnlyBuffer ()
const [virtual]`

Creates a new, read-only double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only double buffer which the caller then owns.

Implements `decaf::nio::DoubleBuffer` (p. 1253).

6.230.2.4 **virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::compact** () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 631) - 1 is copied to index $n = \text{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this DoubleBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1254).

6.230.2.5 **virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::duplicate** () [virtual]

Creates a new double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new double Buffer which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1254).

6.230.2.6 **virtual double decaf::internal::nio::DoubleArrayBuffer::get (std::size_t** *index*) const throw (lang::exceptions::IndexOutOfBoundsException)

[virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the double is to be read

Returns:

the double that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::DoubleBuffer** (p. 1256).

6.230.2.7 virtual double decaf::internal::nio::DoubleArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the double at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::DoubleBuffer** (p. 1256).

6.230.2.8 virtual bool decaf::internal::nio::DoubleArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible double array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::DoubleBuffer** (p. 1256).

6.230.2.9 virtual bool decaf::internal::nio::DoubleArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 630).

6.230.2.10 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1257).

6.230.2.11 **virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (double *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)** [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1257).

6.230.2.12 **virtual void decaf::internal::nio::DoubleArrayBuffer::setReadOnly (bool *value*)** [inline, protected, virtual]

Sets this **ByteBuffer** (p. 694) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.230.2.13 **virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::slice () const** [virtual]

Creates a new **DoubleBuffer** whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **DoubleBuffer** which the caller owns.

Implements `decaf::nio::DoubleBuffer` (p. 1259).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/DoubleArrayBuffer.h`

6.231 decaf::nio::DoubleBuffer Class Reference

This class defines four categories of operations upon double buffers:

#include <src/main/decaf/nio/DoubleBuffer.h> Inheritance diagram for decaf::nio::DoubleBuffer:

Public Member Functions

- virtual **~DoubleBuffer** ()
- virtual std::string **toString** () const
- virtual double * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the double array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **DoubleBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only double buffer that shares this buffer's content.
- virtual **DoubleBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **DoubleBuffer** * **duplicate** ()=0
Creates a new double buffer that shares this buffer's content.
- virtual double **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual double **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **DoubleBuffer** & **get** (std::vector< double > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **DoubleBuffer** & **get** (double *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible double array.
- **DoubleBuffer** & **put** (**DoubleBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the doubles remaining in the given source buffer into this buffer.

- **DoubleBuffer** & **put** (const double *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers doubles into this buffer from the given source array.

- **DoubleBuffer** & **put** (std::vector< double > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source doubles array into this buffer.

- virtual **DoubleBuffer** & **put** (double value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual **DoubleBuffer** & **put** (std::size_t index, double value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given doubles into this buffer at the given index.

- virtual **DoubleBuffer** * **slice** () const =0

*Creates a new **DoubleBuffer** (p. 1250) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **DoubleBuffer** &value) const

Compares this object with the specified object for order.

- virtual bool **equals** (const **DoubleBuffer** &value) const

- virtual bool **operator==** (const **DoubleBuffer** &value) const

Compares equality between this object and the one passed.

- virtual bool **operator<** (const **DoubleBuffer** &value) const

Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **DoubleBuffer** * **allocate** (std::size_t capacity)

Allocates a new Double buffer.

- static **DoubleBuffer** * **wrap** (double *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

*Wraps the passed buffer with a new **DoubleBuffer** (p. 1250).*

- static **DoubleBuffer** * **wrap** (std::vector< double > &buffer)

*Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1250).*

Protected Member Functions

- **DoubleBuffer** (std::size_t capacity)

*Creates a **DoubleBuffer** (p. 1250) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.231.1 Detailed Description

This class defines four categories of operations upon double buffers: o Absolute and relative get and put methods that read and write single doubles; o Relative bulk get methods that transfer contiguous sequences of doubles from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of doubles from a double array or some other double buffer into this buffer o Methods for compacting, duplicating, and slicing a double buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing double array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.231.2 Constructor & Destructor Documentation

6.231.2.1 decaf::nio::DoubleBuffer::DoubleBuffer (std::size_t capacity) [protected]

Creates a **DoubleBuffer** (p. 1250) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 627) in doubles

6.231.2.2 virtual decaf::nio::DoubleBuffer::~~DoubleBuffer () [inline, virtual]

6.231.3 Member Function Documentation

6.231.3.1 static DoubleBuffer* decaf::nio::DoubleBuffer::allocate (std::size_t capacity) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in doubles

Returns:

the **DoubleBuffer** (p. 1250) that was allocated, caller owns.

6.231.3.2 virtual double* decaf::nio::DoubleBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the double array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 627)

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1244).

6.231.3.3 virtual std::size_t decaf::nio::DoubleBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1245).

6.231.3.4 virtual DoubleBuffer* decaf::nio::DoubleBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only double buffer which the caller then owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1245).

6.231.3.5 **virtual DoubleBuffer& decaf::nio::DoubleBuffer::compact () throw (ReadOnlyBufferException)** [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 631) - 1 is copied to index $n = \text{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **DoubleBuffer** (p. 1250)

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1246).

6.231.3.6 **virtual int decaf::nio::DoubleBuffer::compareTo (const DoubleBuffer & value) const** [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.231.3.7 **virtual DoubleBuffer* decaf::nio::DoubleBuffer::duplicate ()** [pure virtual]

Creates a new double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new double **Buffer** (p. 627) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1246).

6.231.3.8 virtual bool decaf::nio::DoubleBuffer::equals (const DoubleBuffer & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.231.3.9 DoubleBuffer& decaf::nio::DoubleBuffer::get (double * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers doubles from this buffer into the given destination array. If there are fewer doubles remaining in the buffer than are required to satisfy the request, that is, if *length* > **remaining()** (p. 632), then no bytes are transferred and a **BufferUnderflowException** (p. 661) is thrown.

Otherwise, this method copies *length* doubles from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by *length*.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than *length* doubles remaining in this buffer

NullPointerException if the passed buffer is null.

6.231.3.10 DoubleBuffer& decaf::nio::DoubleBuffer::get (std::vector< double > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form *src.get(a)* behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call *buffer.resize(N)* before calling this get method.

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than *length* doubles remaining in this buffer

6.231.3.11 `virtual double decaf::nio::DoubleBuffer::get (std::size_t index) const
throw (lang::exceptions::IndexOutOfBoundsException) [pure
virtual]`

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 627) where the double is to be read

Returns:

the double that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1246).

6.231.3.12 `virtual double decaf::nio::DoubleBuffer::get () throw (
BufferUnderflowException) [pure virtual]`

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the double at the current position

Exceptions:

BufferUnderflowException (p. 661) if there no more data to return

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1247).

6.231.3.13 `virtual bool decaf::nio::DoubleBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible double array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1247).

6.231.3.14 `virtual bool decaf::nio::DoubleBuffer::operator< (const DoubleBuffer &
value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.231.3.15 `virtual bool decaf::nio::DoubleBuffer::operator==(const DoubleBuffer & value) const` [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.231.3.16 `virtual DoubleBuffer& decaf::nio::DoubleBuffer::put(std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::DoubleArrayBuffer` (p. 1247).

6.231.3.17 `virtual DoubleBuffer& decaf::nio::DoubleBuffer::put(double value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1248).

6.231.3.18 **DoubleBuffer& decaf::nio::DoubleBuffer::put (std::vector< double > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)**

This method transfers the entire content of the given source doubles array into this buffer. This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters:

buffer - The buffer whose contents are copied to this **DoubleBuffer** (p. 1250)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.231.3.19 **DoubleBuffer& decaf::nio::DoubleBuffer::put (const double * buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)**

This method transfers doubles into this buffer from the given source array. If there are more doubles to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 632), then no doubles are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given `offset` in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters:

buffer- The array from which doubles are to be read

offset- The offset within the array of the first double to be read;

length - The number of doubles to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only
NullPointerException if the passed buffer is null.

6.231.3.20 DoubleBuffer& decaf::nio::DoubleBuffer::put (DoubleBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the doubles remaining in the given source buffer into this buffer. If there are more doubles remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 632), then no doubles are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `n = src.remaining()` doubles from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters:

src - the buffer to take doubles from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer for the remaining doubles in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.231.3.21 virtual DoubleBuffer* decaf::nio::DoubleBuffer::slice () const [pure virtual]

Creates a new **DoubleBuffer** (p. 1250) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **DoubleBuffer** (p. 1250) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1248).

6.231.3.22 virtual std::string decaf::nio::DoubleBuffer::toString () const [virtual]

Returns:

a `std::string` describing this object

6.231.3.23 `static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (std::vector< double > & buffer) [static]`

Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1250). The new buffer will be backed by the given double array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new **DoubleBuffer** (p. 1250) that is backed by *buffer*, caller owns.

6.231.3.24 `static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (double * array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new **DoubleBuffer** (p. 1250). The new buffer will be backed by the given double array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **DoubleBuffer** (p. 1250) that is backed by *buffer*, caller owns.

6.233 activemq::cmsutil::DynamicDestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

#include <src/main/activemq/cmsutil/DynamicDestinationResolver.h> Inheritance diagram for `activemq::cmsutil::DynamicDestinationResolver`:

Data Structures

- class `SessionResolver`

Manages maps of names to topics and queues for a single session.

Public Member Functions

- virtual `~DynamicDestinationResolver ()`
- virtual void `init (ResourceLifecycleManager *mgr)`
Initializes this destination resolver for use.
- virtual void `destroy ()`
Destroys any allocated resources.
- virtual `cms::Destination * resolveDestinationName (cms::Session *session, const std::string &destName, bool pubSubDomain) throw (cms::CMSException)`
Resolves the given name to a destination.

6.233.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.233.2 Constructor & Destructor Documentation

- 6.233.2.1** virtual
`activemq::cmsutil::DynamicDestinationResolver::~~DynamicDestinationResolver ()` [virtual]

6.233.3 Member Function Documentation

- 6.233.3.1** virtual void `activemq::cmsutil::DynamicDestinationResolver::destroy ()` [virtual]

Destroys any allocated resources.

Implements `activemq::cmsutil::DestinationResolver` (p. 1211).

6.233.3.2 virtual void activemq::cmsutil::DynamicDestinationResolver::init (ResourceLifecycleManager * *mgr*) [inline, virtual]

Initializes this destination resolver for use. Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p.1262)).

Parameters:

mgr the resource lifecycle manager.

Implements **activemq::cmsutil::DestinationResolver** (p.1211).

6.233.3.3 virtual cms::Destination* activemq::cmsutil::DynamicDestinationResolver::resolveDestinationName (cms::Session * *session*, const std::string & *destName*, bool *pubSubDomain*) throw (cms::CMSException) [virtual]

Resolves the given name to a destination. If *pubSubDomain* is true, a topic will be returned, otherwise a queue will be returned.

Parameters:

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns:

the resolved destination

Exceptions:

cms::CMSException (p. 850) if resolution failed.

Implements **activemq::cmsutil::DestinationResolver** (p.1212).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/DynamicDestinationResolver.h

6.234 decaf::util::Map< K, V, COMPARATOR >::Entry Class Reference

Default Constructor.

6.235.1.2 decaf::io::EOFException::EOFException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy

6.235.1.3 `decaf::io::EOFException::EOFException (const EOFException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.235.1.4 `decaf::io::EOFException::EOFException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.235.1.5 `decaf::io::EOFException::EOFException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.235.1.6 `decaf::io::EOFException::EOFException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.235.1.7 `virtual decaf::io::EOFException::~~EOFException () throw () [inline, virtual]`

6.235.2 Member Function Documentation

6.235.2.1 `virtual EOFException* decaf::io::EOFException::clone () const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/EOFException.h`

6.236 decaf::lang::Exception Class Reference

#include <src/main/decaf/lang/Exception.h> Inheritance diagram for decaf::lang::Exception:

Public Member Functions

- **Exception** () throw ()
Default Constructor.
- **Exception** (const **Exception** &ex) throw ()
Copy Constructor.
- **Exception** (const std::exception ***cause**) throw ()
Constructor.
- **Exception** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **Exception** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual ~**Exception** () throw ()
- virtual std::string **getMessage** () const
Gets the message for this exception.
- virtual const std::exception * **getCause** () const
*Gets the exception that caused this one to be thrown, this allows for chaining of **exceptions** (p. 104) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.*
- virtual void **initCause** (const std::exception ***cause**)
Initializes the contained cause exception with the one given.
- virtual const char * **what** () const throw ()
Implement method from std::exception.
- virtual void **setMessage** (const char *msg,...)
Sets the cause for this exception.
- virtual void **setMark** (const char *file, const int lineNumber)
Adds a file/line number to the stack trace.
- virtual **Exception** * **clone** () const
Clones this exception.

- virtual `std::vector< std::pair< std::string, int > > getStackTrace () const`
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void `printStackTrace () const`
Prints the stack trace to `std::err`.
- virtual void `printStackTrace (std::ostream &stream) const`
Prints the stack trace to the given output stream.
- virtual `std::string getStackTraceString () const`
Gets the stack trace as one contiguous string.
- virtual `Exception & operator= (const Exception &ex)`
Assignment operator.

Protected Member Functions

- virtual void `setStackTrace (const std::vector< std::pair< std::string, int > > &trace)`
- virtual void `buildMessage (const char *format, va_list &args)`

Protected Attributes

- `std::string message`
The cause of this exception.
- `std::exception * cause`
*The **Exception** (p. 1268) that caused this one to be thrown.*
- `std::vector< std::pair< std::string, int > > stackTrace`
The stack trace.

6.236.1 Constructor & Destructor Documentation

6.236.1.1 decaf::lang::Exception::Exception () throw ()

Default Constructor.

Referenced by `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException()`,
`decaf::util::concurrent::CancellationException::CancellationException()`,
`decaf::util::concurrent::ExecutionException::ExecutionException()`,
`decaf::net::HttpRetryException::HttpRetryException()`, `decaf::net::MalformedURLException::MalformedURLException()`,
`decaf::net::ProtocolException::ProtocolException()`, `decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException()`,
`decaf::net::SocketTimeoutException::SocketTimeoutException()`,
`decaf::util::concurrent::TimeoutException::TimeoutException()`,
`decaf::net::UnknownHostException::UnknownHostException()`, and `decaf::net::UnknownServiceException::UnknownServiceException()`.

6.236.1.2 decaf::lang::Exception::Exception (const Exception & *ex*) throw ()

Copy Constructor.

Parameters:

ex The Exception (p. 1268) instance to copy.

6.236.1.3 decaf::lang::Exception::Exception (const std::exception * *cause*) throw ()

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.236.1.4 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.236.1.5 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw ()

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.236.1.6 virtual decaf::lang::Exception::~~Exception () throw () [virtual]

6.236.2 Member Function Documentation

6.236.2.1 virtual void decaf::lang::Exception::buildMessage (const char * *format*, va_list & *vargs*) [protected, virtual]

Referenced by decaf::lang::exceptions::NumberFormatException::NumberFormatException().

6.236.2.2 virtual Exception* decaf::lang::Exception::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this **Exception** (p.1268) object

Implements decaf::lang::Throwable (p.2556).

Reimplemented in **activemq::exceptions::ActiveMQException** (p.253), **activemq::exceptions::BrokerException** (p.590), **decaf::io::EOFException** (p.1267), **decaf::io::InterruptedIOException** (p.1464), **decaf::io::IOException** (p.1479), **decaf::io::UTFDataFormatException** (p.2685), **decaf::lang::exceptions::ClassCastException** (p.837), **decaf::lang::exceptions::IllegalArgumentException** (p.1395), **decaf::lang::exceptions::IllegalMonitorStateException** (p.1398), **decaf::lang::exceptions::IllegalStateException** (p.1402), **decaf::lang::exceptions::IndexOutOfBoundsException** (p.1405), **decaf::lang::exceptions::InterruptedException** (p.1461), **decaf::lang::exceptions::InvalidStateException** (p.1476), **decaf::lang::exceptions::NoSuchElementException** (p.1947), **decaf::lang::exceptions::NullPointerException** (p.1953), **decaf::lang::exceptions::NumberFormatException** (p.1959), **decaf::lang::exceptions::RuntimeException** (p.2261), **decaf::lang::exceptions::UnsupportedOperationException** (p.2637), **decaf::net::BindException** (p.565), **decaf::net::ConnectException** (p.940), **decaf::net::HttpRetryException** (p.1392), **decaf::net::MalformedURLException** (p.1688), **decaf::net::NoRouteToHostException** (p.1941), **decaf::net::PortUnreachableException** (p.2039), **decaf::net::ProtocolException** (p.2152), **decaf::net::SocketException** (p.2380), **decaf::net::SocketTimeoutException** (p.2397), **decaf::net::UnknownHostException** (p.2631), **decaf::net::UnknownServiceException** (p.2634), **decaf::net::URISyntaxException** (p.2667), **decaf::nio::BufferOverflowException** (p.660), **decaf::nio::BufferUnderflowException** (p.663), **decaf::nio::InvalidMarkException** (p.1472), **decaf::nio::ReadOnlyBufferException** (p.2169), **decaf::util::concurrent::BrokenBarrierException** (p.585), **decaf::util::concurrent::CancellationException** (p.786), **decaf::util::concurrent::ExecutionException** (p.1293), **decaf::util::concurrent::RejectedExecutionException** (p.2176), and **decaf::util::concurrent::TimeoutException** (p.2561).

6.236.2.3 `virtual const std::exception* decaf::lang::Exception::getCause () const`
[inline, virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of **exceptions** (p.104) in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implements **decaf::lang::Throwable** (p.2557).

6.236.2.4 `virtual std::string decaf::lang::Exception::getMessage () const` [inline, virtual]

Gets the message for this exception.

Returns:

Text formatted error message

Implements **decaf::lang::Throwable** (p.2557).

6.236.2.5 `virtual std::vector< std::pair< std::string, int> > decaf::lang::Exception::getStackTrace () const` [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown. The first item in the returned vector is the first point where the mark was set (e.g. where the exception was created).

Returns:

the stack trace.

Implements **decaf::lang::Throwable** (p.2557).

6.236.2.6 `virtual std::string decaf::lang::Exception::getStackTraceString () const`
[virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data

Implements **decaf::lang::Throwable** (p.2557).

6.236.2.7 `virtual void decaf::lang::Exception::initCause (const std::exception * cause)` [virtual]

Initializes the contained cause exception with the one given. A copy is made to avoid ownership issues.

Parameters:

cause The exception that was the cause of this one.

Implements **decaf::lang::Throwable** (p. 2558).

6.236.2.8 virtual Exception& decaf::lang::Exception::operator= (const Exception & *ex*) [virtual]

Assignment operator.

Parameters:

ex const reference to another **Exception** (p. 1268)

6.236.2.9 virtual void decaf::lang::Exception::printStackTrace (std::ostream & *stream*) const [virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

Implements **decaf::lang::Throwable** (p. 2558).

6.236.2.10 virtual void decaf::lang::Exception::printStackTrace () const [virtual]

Prints the stack trace to std::err.

Implements **decaf::lang::Throwable** (p. 2558).

6.236.2.11 virtual void decaf::lang::Exception::setMark (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use `__FILE__`).

lineNumber The line number in the calling file (use `__LINE__`).

Implements **decaf::lang::Throwable** (p. 2558).

Referenced by `activemq::exceptions::BrokerException::BrokerException()`, and `decaf::lang::exceptions::NumberFormatException::NumberFormatException()`.

6.236.2.12 virtual void decaf::lang::Exception::setMessage (const char * *msg*, ...) [virtual]

Sets the cause for this exception.

Parameters:

msg the format string for the msg.
... params to format into the string

Referenced by `activemq::exceptions::BrokerException::BrokerException()`.

6.236.2.13 `virtual void decaf::lang::Exception::setStackTrace (const std::vector< std::pair< std::string, int > > & trace) [protected, virtual]`

6.236.2.14 `virtual const char* decaf::lang::Exception::what () const throw () [inline, virtual]`

Implement method from `std::exception`.

Returns:

the const char* of `getMessage()` (p. 1272).

6.236.3 Field Documentation

6.236.3.1 `std::exception* decaf::lang::Exception::cause [protected]`

The **Exception** (p. 1268) that caused this one to be thrown.

6.236.3.2 `std::string decaf::lang::Exception::message [protected]`

The cause of this exception.

6.236.3.3 `std::vector< std::pair< std::string, int> > decaf::lang::Exception::stackTrace [protected]`

The stack trace.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Exception.h`

6.237 cms::ExceptionListener Class Reference

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener` (p.1275) that is registered with the `Connection` (p.941).

```
#include <src/main/cms/ExceptionListener.h>
```

Public Member Functions

- virtual `~ExceptionListener ()`
- virtual void `onException (const cms::CMSException &ex)=0`
Called when an exception occurs.

6.237.1 Detailed Description

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener` (p.1275) that is registered with the `Connection` (p.941). An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages via the asynchronous event mechanism so they would have no other way to learn that their connection has failed.

Since:

1.0

6.237.2 Constructor & Destructor Documentation

6.237.2.1 virtual `cms::ExceptionListener::~ExceptionListener ()` [inline, virtual]

6.237.3 Member Function Documentation

6.237.3.1 virtual void `cms::ExceptionListener::onException (const cms::CMSException & ex)` [pure virtual]

Called when an exception occurs. Once notified of an exception the caller should no longer use the resource that generated the exception.

Parameters:

ex Exception Object that occurred.

The documentation for this class was generated from the following file:

- `src/main/cms/ExceptionListener.h`

6.238 activemq::commands::ExceptionResponse Class Reference

#include <src/main/activemq/commands/ExceptionResponse.h> Inheritance diagram for activemq::commands::ExceptionResponse:

Public Member Functions

- **ExceptionResponse** ()
- virtual **~ExceptionResponse** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ExceptionResponse * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **BrokerError** > & **getException** () const
- virtual **Pointer**< **BrokerError** > & **getException** ()
- virtual void **setException** (const **Pointer**< **BrokerError** > &exception)

Static Public Attributes

- static const unsigned char **ID_EXCEPTIONRESPONSE** = 31

Protected Member Functions

- **ExceptionResponse** (const **ExceptionResponse** &)
- **ExceptionResponse** & **operator=** (const **ExceptionResponse** &)

Protected Attributes

- **Pointer**< **BrokerError** > **exception**

6.238.1 Constructor & Destructor Documentation

6.238.1.1 `activemq::commands::ExceptionResponse::ExceptionResponse (const ExceptionResponse &) [inline, protected]`

6.238.1.2 `activemq::commands::ExceptionResponse::ExceptionResponse ()`

6.238.1.3 `virtual activemq::commands::ExceptionResponse::~~ExceptionResponse () [virtual]`

6.238.2 Member Function Documentation

6.238.2.1 `virtual ExceptionResponse* activemq::commands::ExceptionResponse::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::Response` (p. 2232).

6.238.2.2 `virtual void activemq::commands::ExceptionResponse::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::Response` (p. 2232).

6.238.2.3 `virtual bool activemq::commands::ExceptionResponse::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::Response` (p. 2232).

6.238.2.4 `virtual unsigned char activemq::commands::ExceptionResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from **activemq::commands::Response** (p. 2233).

- 6.238.2.5** `virtual Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException ()` [virtual]
- 6.238.2.6** `virtual const Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException ()` const [virtual]
- 6.238.2.7** `ExceptionResponse& activemq::commands::ExceptionResponse::operator= (const ExceptionResponse &)` [inline, protected]

Reimplemented from **activemq::commands::Response** (p. 2233).

- 6.238.2.8** `virtual void activemq::commands::ExceptionResponse::setException (const Pointer< BrokerError > & exception)` [virtual]
- 6.238.2.9** `virtual std::string activemq::commands::ExceptionResponse::toString ()` const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2233).

6.238.3 Field Documentation

- 6.238.3.1** `Pointer<BrokerError> activemq::commands::ExceptionResponse::exception` [protected]
- 6.238.3.2** `const unsigned char activemq::commands::ExceptionResponse::ID _ - EXCEPTIONRESPONSE = 31` [static]

The documentation for this class was generated from the following file:

6.239 activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 1279).

#include <src/main/activemq/wireformat/openwire/marshal/v3/ExceptionResponseMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller:

Public Member Functions

- **ExceptionResponseMarshaller** ()
- virtual **~ExceptionResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.239.1 Detailed Description

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 1279). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.239.2 Constructor & Destructor Documentation

6.239.2.1 `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::ExceptionResponseMarshaller()` [inline]

6.239.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::~ExceptionResponseMarshaller()` [inline, virtual]

6.239.3 Member Function Documentation

6.239.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.239.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.239.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2247).

6.239.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::looseUnmarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2248).

6.239.3.5 virtual int **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightMarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2248).

6.239.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2249).

6.239.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2250).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/ExceptionResponseMarshaller.h

6.240 activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p.1283).

#include <src/main/activemq/wireformat/openwire/marshal/v1/ExceptionResponseMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller:

Public Member Functions

- **ExceptionResponseMarshaller** ()
- virtual **~ExceptionResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.240.1 Detailed Description

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p.1283). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.240.2 Constructor & Destructor Documentation

6.240.2.1 `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::ExceptionResponseMarshaller()` [inline]

6.240.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::~ExceptionResponseMarshaller()` [inline, virtual]

6.240.3 Member Function Documentation

6.240.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.240.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.240.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.240.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2253).

6.240.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2253).

6.240.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2254).

6.240.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2255).

The documentation for this class was generated from the following file:

activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::~ExceptionR
() [inline, virtual]`

6.241.3 Member Function Documentation

6.241.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.241.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::getDataStructu
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.241.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.241.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.241.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.241.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2244).

6.241.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2245).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/ExceptionResponseMarshaller.h

6.242 decaf::util::concurrent::ExecutionException Class Reference

#include <src/main/decaf/util/concurrent/ExecutionException.h> Inheritance diagram for decaf::util::concurrent::ExecutionException:

Public Member Functions

- **ExecutionException** () throw ()
Default Constructor.
- **ExecutionException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **ExecutionException** (const **ExecutionException** &ex) throw ()
Copy Constructor.
- **ExecutionException** (const std::exception *cause) throw ()
Constructor.
- **ExecutionException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ExecutionException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ExecutionException** * clone () const
Clones this exception.
- virtual ~**ExecutionException** () throw ()

6.242.1 Constructor & Destructor Documentation

6.242.1.1 decaf::util::concurrent::ExecutionException::ExecutionException () throw () [inline]

Default Constructor.

6.242.1.2 decaf::util::concurrent::ExecutionException::ExecutionException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex - An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.242.1.3 `decaf::util::concurrent::ExecutionException::ExecutionException (const ExecutionException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

References `decaf::lang::Exception::Exception()`.

6.242.1.4 `decaf::util::concurrent::ExecutionException::ExecutionException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.242.1.5 `decaf::util::concurrent::ExecutionException::ExecutionException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - The list of primitives that are formatted into the message

6.242.1.6 `decaf::util::concurrent::ExecutionException::ExecutionException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.242.1.7 virtual decaf::util::concurrent::ExecutionException::~ExecutionException
() throw () [inline, virtual]

6.242.2 Member Function Documentation

6.242.2.1 virtual ExecutionException* decaf::util::concurrent::ExecutionException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ExecutionException.h**

6.243 decaf::util::concurrent::Executor Class Reference

An object that executes submitted **decaf.lang Runnable** (p. 2256) tasks.

```
#include <src/main/decaf/util/concurrent/Executor.h>
```

Public Member Functions

- virtual **~Executor** ()
- virtual void **execute** (Runnable *command)=0 throw (decaf::util::concurrent::RejectedExecutionException, decaf::lang::exceptions::NullPointerException)

Executes the given command at some time in the future.

6.243.1 Detailed Description

An object that executes submitted **decaf.lang Runnable** (p. 2256) tasks. This interface provides a way of decoupling task submission from the mechanics of how each task will be run, including details of thread use, scheduling, etc. An **Executor** (p. 1294) is normally used instead of explicitly creating threads. For example, rather than invoking `new Thread(new RunnableTask()).start()` for each of a set of tasks, you might use:

```
Executor (p.1294) executor = anExecutor;
executor->execute( new RunnableTask1() );
executor->execute( new RunnableTask2() );
...
```

However, the **Executor** (p. 1294) interface does not strictly require that execution be asynchronous. In the simplest case, an executor can run the submitted task immediately in the caller's thread:

```
class DirectExecutor : public Executor (p.1294) {
public:

    void execute( Runnable* r ) (p.1295) {
        r->run();
    }

}
```

More typically, tasks are executed in some thread other than the caller's thread. The executor below spawns a new thread for each task.

```
class ThreadPerTaskExecutor : public Executor (p.1294) {
public:
    std::vector<Thread*gt; threads;

    void execute( Runnable* r ) (p.1295) {
        threads.push_back( new Thread( r ) );
        threads.rbegin()->start();
    }
}
```

```
}
```

The `Executor` (p. 1294) implementations provided in this package implement `decaf.util.concurrent.ExecutorService` (p. ??), which is a more extensive interface. The `decaf.util.concurrent.ThreadPoolExecutor` (p. ??) class provides an extensible thread pool implementation. The `decaf.util.concurrentExecutor` (p. ??) class provides convenient factory methods for these Executors.

Since:

1.0

6.243.2 Constructor & Destructor Documentation

6.243.2.1 `virtual decaf::util::concurrent::Executor::~~Executor ()` [inline, virtual]

6.243.3 Member Function Documentation

6.243.3.1 `virtual void decaf::util::concurrent::Executor::execute (Runnable * command) throw (decaf::util::concurrent::RejectedExecutionException, decaf::lang::exceptions::NullPointerException)` [pure virtual]

Executes the given command at some time in the future. The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the `Executor` (p. 1294) implementation.

Parameters:

command the runnable task

Exceptions:

RejectedExecutionException (p. 2174) if this task cannot be accepted for execution.

NullPointerException if command is null

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Executor.h`

6.244 activemq::transport::failover::FailoverTransport Class Reference

#include <src/main/activemq/transport/failover/FailoverTransport.h> Inheritance diagram for activemq::transport::failover::FailoverTransport:

Public Member Functions

- **FailoverTransport** ()
- virtual **~FailoverTransport** ()
- void **reconnect** ()
*Indicates that the **Transport** (p. 2608) needs to reconnect to another URI in its list.*
- void **add** (const std::string &uri)
*Adds a New URI to the List of URIs this **transport** (p. 67) can Connect to.*
- virtual void **addURI** (const List< URI > &uris)
*Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2608) is a composite of.*
- virtual void **removeURI** (const List< URI > &uris)
*Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2608) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2608) should result in that **Transport** (p. 2608) being disposed of.*
- virtual void **start** () throw (cms::CMSException)
*Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59).*
- virtual void **close** () throw (cms::CMSException)
Stops the polling thread and closes the streams.
- virtual void **oneway** (const Pointer< Command > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends a one-way command.
- virtual Pointer< Response > **request** (const Pointer< Command > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given command to the broker and then waits for the response.
- virtual Pointer< Response > **request** (const Pointer< Command > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given command to the broker and then waits for the response.
- virtual void **setWireFormat** (const Pointer< wireformat::WireFormat > &wireFormat AMQCPP_UNUSED)
Sets the WireFormat instance to use.

- virtual void **setTransportListener** (**TransportListener** *listener)
*Sets the observer of asynchronous events from this **transport** (p. 67).*
- virtual **TransportListener** * **getTransportListener** () const

6.244.1 Constructor & Destructor Documentation

6.244.1.1 **activemq::transport::failover::FailoverTransport::FailoverTransport** ()

6.244.1.2 **virtual**
activemq::transport::failover::FailoverTransport::~~FailoverTransport ()
[virtual]

6.244.2 Member Function Documentation

6.244.2.1 **void activemq::transport::failover::FailoverTransport::add** (const std::string & *uri*)

Adds a New URI to the List of URIs this **transport** (p. 67) can Connect to.

Parameters:

uri A String version of a URI to add to the URIs to **failover** (p. 69) to.

6.244.2.2 virtual void activemq::transport::failover::FailoverTransport::addURI (const List< URI > & *uris*) [virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2608) is a composite of.

Parameters:

uris The new URIs to add to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 911).

6.244.2.3 virtual void activemq::transport::failover::FailoverTransport::close () throw (cms::CMSException) [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

CMSException if errors occur.

Implements **cms::Closeable** (p. 838).

- 6.244.2.4 `long long activemq::transport::failover::FailoverTransport::getBackOffMultiplier () const [inline]`
- 6.244.2.5 `int activemq::transport::failover::FailoverTransport::getBackupPoolSize () const [inline]`
- 6.244.2.6 `long long activemq::transport::failover::FailoverTransport::getInitialReconnectDelay () const [inline]`
- 6.244.2.7 `int activemq::transport::failover::FailoverTransport::getMaxCacheSize () const [inline]`
- 6.244.2.8 `int activemq::transport::failover::FailoverTransport::getMaxReconnectAttempts () const [inline]`
- 6.244.2.9 `long long activemq::transport::failover::FailoverTransport::getMaxReconnectDelay () const [inline]`
- 6.244.2.10 `long long activemq::transport::failover::FailoverTransport::getReconnectDelay () const [inline]`
- 6.244.2.11 `virtual std::string activemq::transport::failover::FailoverTransport::getRemoteAddress () const [virtual]`

Returns:

the remote address for this connection

Implements `activemq::transport::Transport` (p. 2609).

- 6.244.2.12 `long long activemq::transport::failover::FailoverTransport::getTimeout () const [inline]`
- 6.244.2.13 `virtual TransportListener* activemq::transport::failover::FailoverTransport::getTransportListener () const [virtual]`

Gets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).

Returns:

The listener of **transport** (p. 67) events.

Implements `activemq::transport::Transport` (p. 2609).

6.244.2.14 void activemq::transport::failover::FailoverTransport::handleTransportFailure (const decaf::lang::Exception & *error*) throw (decaf::lang::Exception) [protected]

Called when this class' **TransportListener** (p. 2624) is notified of a Failure.

Parameters:

error - The CMS Exception that was thrown.

Exceptions:

Exception if an error occurs.

6.244.2.15 bool activemq::transport::failover::FailoverTransport::isBackup () const [inline]

6.244.2.16 virtual bool activemq::transport::failover::FailoverTransport::isClosed () const [inline, virtual]

Has the **Transport** (p. 2608) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 2608)

Implements **activemq::transport::Transport** (p. 2609).

6.244.2.17 virtual bool activemq::transport::failover::FailoverTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 2608) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2610).

6.244.2.18 virtual bool activemq::transport::failover::FailoverTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 2608) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2610).

6.244.2.19 `bool activemq::transport::failover::FailoverTransport::isInitialized () const [inline]`

Returns true if the **Transport** (p. 2608) has been initialized by a BrokerInfo command.

Returns:

true if the **Transport** (p. 2608) has been initialized by a BrokerInfo command.

6.244.2.20 `virtual bool activemq::transport::failover::FailoverTransport::isPending () const [virtual]`

Returns:

true if there is a need for the iterate method to be called by this classes task runner.

Implements **activemq::threads::CompositeTask** (p. 906).

6.244.2.21 `bool activemq::transport::failover::FailoverTransport::isRandomize () const [inline]`

6.244.2.22 `bool activemq::transport::failover::FailoverTransport::isTrackMessages () const [inline]`

6.244.2.23 `bool activemq::transport::failover::FailoverTransport::isUseExponentialBackOff () const [inline]`

6.244.2.24 `virtual bool activemq::transport::failover::FailoverTransport::iterate () [virtual]`

Performs the actual Reconnect operation for the **FailoverTransport** (p. 1296), when a connection is made this method returns false to indicate it doesn't need to run again, otherwise it returns true to indicate its still trying to connect.

Returns:

false to indicate a connection, true to indicate it needs to try again.

Implements **activemq::threads::Task** (p. 2520).

6.244.2.25 `virtual Transport* activemq::transport::failover::FailoverTransport::narrow (const std::type_info & typeId) [inline, virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 2608) to allow a higher level **transport** (p. 67) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2610).

References **activemq::transport::Transport::narrow()**.

6.244.2.26 `virtual void activemq::transport::failover::FailoverTransport::oneway
(const Pointer< Command > & command)
throw (decaf::io::IOException, de-
caf::lang::exceptions::UnsupportedOperationException)
[virtual]`

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2610).

6.244.2.27 `virtual void activemq::transport::failover::FailoverTransport::reconnect
(const decaf::net::URI & uri) throw (decaf::io::IOException)
[virtual]`

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

Implements **activemq::transport::Transport** (p. 2611).

6.244.2.28 `void activemq::transport::failover::FailoverTransport::reconnect ()`

Indicates that the **Transport** (p. 2608) needs to reconnect to another URI in its list.

6.244.2.29 `virtual void activemq::transport::failover::FailoverTransport::removeURI
(const List< URI > & uris) [virtual]`

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2608) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2608) should result in that **Transport** (p. 2608) being disposed of.

Parameters:

uris The new URIs to remove to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 912).

6.244.2.30 `virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters:

command - The command to be sent.

timeout - The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2611).

6.244.2.31 `virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2612).

6.244.2.32 `void activemq::transport::failover::FailoverTransport::restoreTransport (const Pointer< Transport > & transport) throw (decaf::io::IOException) [protected]`

Given a **Transport** (p. 2608) restore the **state** (p. 65) of the Client's connection to the Broker using the data accumulated in the State Tracker.

Parameters:

transport (p. 67) The new **Transport** (p. 2608) connected to the Broker.

Exceptions:

IOException if an errors occurs while restoring the old **state** (p. 65).

6.244.2.33 void activemq::transport::failover::FailoverTransport::setBackOffMultiplier (long long *value*) [inline]

6.244.2.34 void activemq::transport::failover::FailoverTransport::setBackup (bool *value*) [inline]

6.244.2.35 void activemq::transport::failover::FailoverTransport::setBackupPoolSize (int *value*) [inline]

6.244.2.36 void activemq::transport::failover::FailoverTransport::setInitialized (bool *value*) [inline]

Sets the initialized **state** (p. 65) of this **Transport** (p. 2608) to true.

Parameters:

value - true if this **Transport** (p. 2608) has been initialized.

- 6.244.2.37 `void activemq::transport::failover::FailoverTransport::setInitialReconnectDelay (long long value) [inline]`
- 6.244.2.38 `void activemq::transport::failover::FailoverTransport::setMaxCacheSize (int value) [inline]`
- 6.244.2.39 `void activemq::transport::failover::FailoverTransport::setMaxReconnectAttempts (int value) [inline]`
- 6.244.2.40 `void activemq::transport::failover::FailoverTransport::setMaxReconnectDelay (long long value) [inline]`
- 6.244.2.41 `void activemq::transport::failover::FailoverTransport::setRandomize (bool value) [inline]`
- 6.244.2.42 `void activemq::transport::failover::FailoverTransport::setReconnectDelay (long long value) [inline]`
- 6.244.2.43 `void activemq::transport::failover::FailoverTransport::setTimeout (long long value) [inline]`
- 6.244.2.44 `void activemq::transport::failover::FailoverTransport::setTrackMessages (bool value) [inline]`
- 6.244.2.45 `virtual void activemq::transport::failover::FailoverTransport::setTransportListener (TransportListener * listener) [virtual]`

Sets the observer of asynchronous events from this **transport** (p. 67).

Parameters:

listener the listener of **transport** (p. 67) events.

Implements **activemq::transport::Transport** (p. 2612).

- 6.244.2.46 `void activemq::transport::failover::FailoverTransport::setUseExponentialBackOff (bool value) [inline]`
- 6.244.2.47 `virtual void activemq::transport::failover::FailoverTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat AMQCPP_UNUSED) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 59).

6.244.2.48 virtual void activemq::transport::failover::FailoverTransport::start () throw (cms::CMSException) [virtual]

Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59). If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

CMSException if an error occurs or if this **transport** (p. 67) has already been closed.

Implements **cms::Startable** (p. 2413).

6.244.3 Friends And Related Function Documentation

6.244.3.1 friend class FailoverTransportListener [friend]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransport.h**

6.245 activemq::transport::failover::FailoverTransportFactory Class Reference

Creates an instance of a **FailoverTransport** (p.1296).

#include <src/main/activemq/transport/failover/FailoverTransportFactory.h> Inheritance diagram for activemq::transport::failover::FailoverTransportFactory:

Public Member Functions

- virtual **~FailoverTransportFactory** ()
- virtual **Pointer< Transport > create** (const **decaf::net::URI** &location) throw (exceptions::ActiveMQException)

*Creates a fully configured **Transport** (p.2608) instance which could be a chain of filters and transports.*

6.245.3.1 virtual Pointer<Transport> ac-
 tivemq::transport::failover::FailoverTransportFactory::create (const
 decaf::net::URI & *location*) throw (exceptions::ActiveMQException)
 [virtual]

Creates a fully configured **Transport** (p.2608) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.2614).

6.245.3.2 virtual Pointer<Transport> ac-
 tivemq::transport::failover::FailoverTransportFactory::createComposite
 (const decaf::net::URI & *location*) throw (excep-
 tions::ActiveMQException) [virtual]

Creates a slimed down **Transport** (p.2608) instance which can be used in composite **transport** (p.67) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.2615).

6.245.3.3 virtual Pointer<Transport> ac-
 tivemq::transport::failover::FailoverTransportFactory::doCreateComposite
 (const decaf::net::URI & *location*, const decaf::util::Properties &
properties) throw (exceptions::ActiveMQException) [protected,
 virtual]

Creates a slimed down **Transport** (p.2608) instance which can be used in composite **transport** (p.67) instances.

Parameters:

location - URI location to connect to.

properties - Properties to apply to the **transport** (p. 67).

Returns:

Pointer to a new **FailoverTransport** (p. 1296) instance.

Exceptions:

ActiveMQException if an error occurs

6.246.2.2 `virtual
activemq::transport::failover::FailoverTransportListener::~~FailoverTransportListener
() [virtual]`

6.246.3 Member Function Documentation

6.246.3.1 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::onCommand
(const Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command. The **transport** (p. 67) passes off all received **commands** (p. 59) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2608) deletes the command upon receipt.

Parameters:

command the received command object.

Implements `activemq::transport::TransportListener` (p. 2624).

6.246.3.2 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::onException
(const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command **transport** (p. 67).

Parameters:

ex The exception.

Implements `activemq::transport::TransportListener` (p. 2625).

6.246.3.3 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::transportInterrupted
() [virtual]`

The **transport** (p. 67) has suffered an interruption from which it hopes to recover.

Implements `activemq::transport::TransportListener` (p. 2625).

6.246.3.4 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::transportResumed
() [virtual]`

The **transport** (p. 67) has resumed after an interruption.

Implements `activemq::transport::TransportListener` (p. 2625).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/failover/FailoverTransportListener.h`

6.247 decaf::util::logging::Filter Class Reference

A **Filter** (p. 1314) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.

```
#include <src/main/decaf/util/logging/Filter.h>
```

Public Member Functions

- virtual **~Filter** ()
- virtual bool **isLoggable** (const **LogRecord** &record) const =0

Check if a given log record should be published.

6.247.1 Detailed Description

A **Filter** (p.1314) can be used to provide fine grain control over what is logged, beyond the control provided by log levels. Each **Logger** (p.1623) and each **Handler** (p.1382) can have a filter associated with it. The **Logger** (p.1623) or **Handler** (p.1382) will call the **isLoggable** method to check if a given **LogRecord** (p.1645) should be published. If **isLoggable** returns false, the **LogRecord** (p.1645) will be discarded.

6.247.2 Constructor & Destructor Documentation

6.247.2.1 virtual decaf::util::logging::Filter::~Filter () [inline, virtual]

6.247.3 Member Function Documentation

6.247.3.1 virtual bool decaf::util::logging::Filter::isLoggable (const **LogRecord** &*record*) const [pure virtual]

Check if a given log record should be published.

Parameters:

record the **LogRecord** (p.1645) to check.

Returns:

true if the record is loggable.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Filter.h**

6.248 decaf::io::FilterInputStream Class Reference

A **FilterInputStream** (p.1315) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

#include <src/main/decaf/io/FilterInputStream.h> Inheritance diagram for decaf::io::FilterInputStream:

Public Member Functions

- **FilterInputStream** (**InputStream** *inputStream, bool own=false)
*Constructor to create a wrapped **InputStream** (p. 1406).*
- virtual ~**FilterInputStream** ()
- virtual std::size_t **available** () const throw (**IOException**)
Returns the number of bytes that can be read from this input stream without blocking.
- virtual unsigned char **read** () throw (**IOException**)
Reads the next byte of data from this input stream.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (**IOException**, lang::exceptions::NullPointerException)
Reads up to len bytes of data from this input stream into an array of bytes.
- virtual void **close** () throw (lang::Exception)
*Close the Stream, the **FilterOutputStream** (p. 1322) simply calls the close method of the underlying stream.*
- virtual std::size_t **skip** (std::size_t num) throw (**io::IOException**, lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual void **mark** (int readLimit)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (**IOException**)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const
Determines if this input stream supports the mark and reset methods.
- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.

- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual bool **isClosed** () const

Protected Attributes

- **InputStream * inputStream**
- **util::concurrent::Mutex mutex**
- bool **own**
- volatile bool **closed**

6.248.1 Detailed Description

A **FilterInputStream** (p.1315) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality. The class **FilterInputStream** (p.1315) itself simply overrides all methods of **InputStream** (p.1406) with versions that pass all requests to the contained input stream. Subclasses of **FilterInputStream** (p.1315) may further override some of these methods and may also provide additional methods and fields.

6.248.2 Constructor & Destructor Documentation

6.248.2.1 decaf::io::FilterInputStream::FilterInputStream (InputStream * *inputStream*, bool *own* = false) [inline]

Constructor to create a wrapped **InputStream** (p.1406).

Parameters:

- inputStream* the stream to wrap and filter
- own* indicates if we own the stream object, defaults to false

6.248.2.2 virtual decaf::io::FilterInputStream::~FilterInputStream () [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.248.3 Member Function Documentation

6.248.3.1 `virtual std::size_t decaf::io::FilterInputStream::available () const throw (IOException) [inline, virtual]`

Returns the number of bytes that can be read from this input stream without blocking. This method simply performs `in.available()` and returns the result.

Returns:

the number of bytes available without blocking.

Implements **decaf::io::InputStream** (p. 1407).

Reimplemented in **decaf::io::BufferedInputStream** (p. 634).

References `DECAF_CATCH_RETHROW`, and `DECAF_CATCHALL_THROW`.

6.248.3.2 `virtual void decaf::io::FilterInputStream::close () throw (lang::Exception) [inline, virtual]`

Close the Stream, the **FilterOutputStream** (p. 1322) simply calls the close method of the underlying stream.

Exceptions:

Exception

Implements **decaf::io::Closeable** (p. 840).

Reimplemented in **decaf::io::BufferedInputStream** (p. 635).

References `DECAF_CATCH_RETHROW`, and `DECAF_CATCHALL_THROW`.

6.248.3.3 `virtual bool decaf::io::FilterInputStream::isClosed () const [inline, protected, virtual]`

Returns:

true if this stream has been closed.

6.248.3.4 `virtual void decaf::io::FilterInputStream::lock () throw (lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.248.3.5 **virtual void decaf::io::FilterInputStream::mark (int readLimit) [inline, virtual]**

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit The max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1407).

Reimplemented in **decaf::io::BufferedInputStream** (p. 635).

References DECAF_CATCHALL_NOTHROW.

6.248.3.6 **virtual bool decaf::io::FilterInputStream::markSupported () const [inline, virtual]**

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1407).

Reimplemented in **decaf::io::BufferedInputStream** (p. 635).

References DECAF_CATCHALL_NOTHROW.

6.248.3.7 **virtual void decaf::io::FilterInputStream::notify () throw (lang::Exception) [inline, virtual]**

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.248.3.8 **virtual void decaf::io::FilterInputStream::notifyAll () throw (lang::Exception) [inline, virtual]**

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.248.3.9 `virtual int decaf::io::FilterInputStream::read (unsigned char * buffer,
std::size_t offset, std::size_t bufferSize) throw (IOException,
lang::exceptions::NullPointerException) [inline, virtual]`

Reads up to len bytes of data from this input stream into an array of bytes. This method blocks until some input is available. This method simply performs `in.read(b, len)` and returns the result.

Parameters:

buffer (out) the target buffer.

offset the position to start reading in the passed buffer.

bufferSize the size of the output buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException

Implements **decaf::io::InputStream** (p. 1408).

Reimplemented in **activemq::io::LoggingInputStream** (p. 1633), **decaf::io::BufferedInputStream** (p. 635), and **decaf::io::DataInputStream** (p. 1118).

References `DECAF_CATCH_RETHROW`, and `DECAF_CATCHALL_THROW`.

6.248.3.10 `virtual unsigned char decaf::io::FilterInputStream::read () throw (IOException) [inline, virtual]`

Reads the next byte of data from this input stream. The value byte is returned as an unsigned char in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown. This method simply performs `in.read()` and returns the result.

Returns:

The next byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1408).

Reimplemented in **activemq::io::LoggingInputStream** (p. 1634), and **decaf::io::BufferedInputStream** (p. 636).

References `DECAF_CATCH_RETHROW`, and `DECAF_CATCHALL_THROW`.

6.248.3.11 `virtual void decaf::io::FilterInputStream::reset () throw (IOException)` [inline, virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1477) might be thrown. * If such an **IOException** (p. 1477) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1477). * If an **IOException** (p. 1477) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException (p. 1477)

Implements **decaf::io::InputStream** (p. 1408).

Reimplemented in **decaf::io::BufferedInputStream** (p. 636).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.248.3.12 `virtual std::size_t decaf::io::FilterInputStream::skip` (`std::size_t num`) `throw (io::IOException,` `lang::exceptions::UnsupportedOperationException)` [inline, virtual]

Skips over and discards n bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If n is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1406) creates a byte array and then repeatedly reads into it until n bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num - the number of bytes to skip

Returns:

total bytes skipped

Exceptions:

IOException (p. 1477) if an error occurs

Implements **decaf::io::InputStream** (p. 1409).

Reimplemented in **decaf::io::BufferedInputStream** (p. 636), and **decaf::io::DataInputStream** (p. 1124).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.248.3.13 `virtual void decaf::io::FilterInputStream::unlock () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2512).

6.248.3.14 `virtual void decaf::io::FilterInputStream::wait (unsigned long milliseconds) throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or `WAIT_INFINITE`

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2513).

6.248.3.15 `virtual void decaf::io::FilterInputStream::wait () throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2514).

6.249 decaf::io::FilterOutputStream Class Reference

This class is the superclass of all classes that filter output streams.

#include <src/main/decaf/io/FilterOutputStream.h> Inheritance diagram for decaf::io::FilterOutputStream:

Public Member Functions

- **FilterOutputStream** (**OutputStream** *outputStream, bool own=false)
Constructor, creates a wrapped output stream.
- virtual ~**FilterOutputStream** ()
- virtual void **write** (unsigned char c) throw (**IOException**)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (**IOException**)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset **DECAF_UNUSED**, std::size_t len) throw (**IOException**, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** () throw (**IOException**)
Flushes any pending writes in this output stream.
- virtual void **close** () throw (lang::Exception)
Close the Stream.
- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual bool **isClosed** () const

Protected Attributes

- **OutputStream * outputStream**
- **util::concurrent::Mutex mutex**
- bool **own**
- volatile bool **closed**

6.249.1 Detailed Description

This class is the superclass of all classes that filter output streams. These streams sit on top of an already existing output stream (the underlying output stream) which it uses as its basic sink of data, but possibly transforming the data along the way or providing additional functionality.

The class **FilterOutputStream** (p. 1322) itself simply overrides all methods of **OutputStream** (p. 1992) with versions that pass all requests to the underlying output stream. Subclasses of **FilterOutputStream** (p. 1322) may further override some of these methods as well as provide additional methods and fields.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped **InputStream** (p. 1406) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

```
DataOutputStream (p. 1125) os = new DataOutputStream (p. 1125)( new OutputStream(),
true )
```

6.249.2 Constructor & Destructor Documentation

6.249.2.1 decaf::io::FilterOutputStream::FilterOutputStream (OutputStream * *outputStream*, bool *own* = false) [inline]

Constructor, creates a wrapped output stream.

Parameters:

outputStream the **OutputStream** (p. 1992) to wrap

own If true, this object will control the lifetime of the output stream that it encapsulates.

6.249.2.2 virtual decaf::io::FilterOutputStream::~~FilterOutputStream () [inline, virtual]

References **DECAF_CATCH_NOTHROW**, and **DECAF_CATCHALL_NOTHROW**.

6.249.3 Member Function Documentation

6.249.3.1 `virtual void decaf::io::FilterOutputStream::close () throw (lang::Exception) [inline, virtual]`

Closes the Stream. The close method of **FilterOutputStream** (p.1322) calls its flush method, and then calls the close method of its underlying output stream, it then destroys the output stream if it is the owner.

Exceptions:

Exception

Implements **decaf::io::Closeable** (p. 840).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 639).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.249.3.2 `virtual void decaf::io::FilterOutputStream::flush () throw (IOException) [inline, virtual]`

Flushes any pending writes in this output stream. The flush method of **FilterOutputStream** (p.1322) calls the flush method of its underlying output stream

Exceptions:

IOException (p. 1477)

Implements **decaf::io::OutputStream** (p.1992).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 639).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.249.3.3 `virtual bool decaf::io::FilterOutputStream::isClosed () const [inline, protected, virtual]`

Returns:

true if this stream has been closed.

6.249.3.4 `virtual void decaf::io::FilterOutputStream::lock () throw (lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.249.3.5 virtual void decaf::io::FilterOutputStream::notify () throw (lang::Exception) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.249.3.6 virtual void decaf::io::FilterOutputStream::notifyAll () throw (lang::Exception) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.249.3.7 virtual void decaf::io::FilterOutputStream::unlock () throw (lang::Exception) [inline, virtual]

Unlocks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

6.249.3.8 virtual void decaf::io::FilterOutputStream::wait (unsigned long *milliseconds*) throw (lang::Exception) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.249.3.9 virtual void decaf::io::FilterOutputStream::wait () throw (lang::Exception) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

6.249.3.10 virtual void decaf::io::FilterOutputStream::write (const unsigned char * *buffer*, std::size_t *offset* *DECAF_UNUSED*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [inline, virtual]

Writes an array of bytes to the output stream. The write method of **FilterOutputStream** (p. 1322) calls the write method of one argument on each byte to output.

Parameters:

buffer The array of bytes to write.

offset, the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implements **decaf::io::OutputStream** (p. 1993).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 1635), **decaf::io::BufferedOutputStream** (p. 639), and **decaf::io::DataOutputStream** (p. 1127).

References *DECAF_CATCH_RETHROW*, and *DECAF_CATCHALL_THROW*.

6.249.3.11 virtual void decaf::io::FilterOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [inline, virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 640), and **decaf::io::DataOutputStream** (p. 1127).

References *DECAF_CATCH_RETHROW*, and *DECAF_CATCHALL_THROW*.

6.249.3.12 virtual void decaf::io::FilterOutputStream::write (unsigned char *c*) throw (IOException) [inline, virtual]

Writes a single byte to the output stream. The write method of **FilterOutputStream** (p. 1322) calls the write method of its underlying output stream, that is, it performs out.write(b).

Parameters:

c the byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 1993).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 1636), **decaf::io::BufferedOutputStream** (p. 640), and **decaf::io::DataOutputStream** (p. 1127).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.249.4 Field Documentation

6.250 decaf::lang::Float Class Reference

#include <src/main/decaf/lang/Float.h> Inheritance diagram for decaf::lang::Float:

Public Member Functions

- **Float** (float value)
- **Float** (double value)
- **Float** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Float** ()
- virtual int **compareTo** (const **Float** &f) const
*Compares this **Float** (p. 1328) instance with another.*
- bool **equals** (const **Float** &f) const
- virtual bool **operator==** (const **Float** &f) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Float** &f) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const float &f) const
*Compares this **Float** (p. 1328) instance with another.*
- bool **equals** (const float &f) const
- virtual bool **operator==** (const float &f) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const float &f) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.

- virtual long long **longValue** () const
Answers the long value which the receiver represents.
- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (float f1, float f2)
Compares the two specified double values.
- static int **floatToIntBits** (float value)
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout.
- static int **floatToRawIntBits** (float value)
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values.
- static float **intBitsToFloat** (int bits)
Returns the float value corresponding to a given bit representation.
- static bool **isInfinite** (float value)
- static bool **isNaN** (float value)
- static float **parseFloat** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1328).*
- static std::string **toHexString** (float value)
Returns a hexadecimal string representation of the float argument.
- static std::string **toString** (float value)
Returns a string representation of the float argument.
- static **Float** **valueOf** (float value)
*Returns a **Float** (p. 1328) instance representing the specified float value.*
- static **Float** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Float** (p. 1328) instance that wraps a primitive float which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE** = 32
The size in bits of the primitive int type.
- static const float **MAX_VALUE**

The maximum value that the primitive type can hold.

- static const float **MIN_VALUE**

The minimum value that the primitive type can hold.

- static const float **NaN**

*Constant for the Not a **Number** (p. 1954) Value.*

- static const float **POSITIVE_INFINITY**

Constant for Positive Infinity.

- static const float **NEGATIVE_INFINITY**

Constant for Negative Infinity.

6.250.1 Constructor & Destructor Documentation

6.250.1.1 `decaf::lang::Float::Float (float value)`

Parameters:

value - the primitive type to wrap

6.250.1.2 `decaf::lang::Float::Float (double value)`

Parameters:

value - the primitive type to wrap

6.250.1.3 `decaf::lang::Float::Float (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters:

value - the string to convert to a primitive type to wrap

6.250.1.4 `virtual decaf::lang::Float::~~Float () [inline, virtual]`

6.250.2 Member Function Documentation

6.250.2.1 `virtual unsigned char decaf::lang::Float::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from `decaf::lang::Number` (p. 1954).

6.250.2.2 static int decaf::lang::Float::compare (float *f1*, float *f2*) [static]

Compares the two specified double values. The sign of the integer value returned is the same as that of the integer that would be returned by the call: `Float(f1).compareTo(Float(f2))`

Parameters:

f1 - the first double to compare

f2 - the second double to compare

Returns:

the value 0 if *d1* is numerically equal to *f2*; a value less than 0 if *f1* is numerically less than *f2*; and a value greater than 0 if *f1* is numerically greater than *f2*.

6.250.2.3 virtual int decaf::lang::Float::compareTo (const float & *f*) const [virtual]

Compares this **Float** (p. 1328) instance with another.

Parameters:

f - the **Float** (p. 1328) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< float > (p. 899).

6.250.2.4 virtual int decaf::lang::Float::compareTo (const Float & *f*) const [virtual]

Compares this **Float** (p. 1328) instance with another.

Parameters:

f - the **Float** (p. 1328) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.250.2.5 virtual double decaf::lang::Float::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.250.2.6 `bool decaf::lang::Float::equals (const float & f) const` [inline, virtual]**Parameters:**

f - the **Float** (p. 1328) object to compare against.

Returns:

true if the two **Float** (p. 1328) Objects have the same value.

Implements **decaf::lang::Comparable**< **float** > (p. 900).

6.250.2.7 `bool decaf::lang::Float::equals (const Float & f) const` [inline]**Parameters:**

f - the **Float** (p. 1328) object to compare against.

Returns:

true if the two **Float** (p. 1328) Objects have the same value.

6.250.2.8 `static int decaf::lang::Float::floatToIntBits (float value)` [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout. Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is 0x7c000000.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1333) method, will produce a floating-point value the same as the argument to **floatToIntBits** (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters:

value - the float to convert to int bits

Returns:

the int that holds the float's value

6.250.2.9 `static int decaf::lang::Float::floatToRawIntBits (float value)` [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values. Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is the integer representing the actual NaN value. Unlike the `floatToIntBits` method, `intToRawIntBits` does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is an integer that, when given to the `intBitsToFloat(int)` (p. 1333) method, will produce a floating-point value the same as the argument to `floatToRawIntBits`.

Parameters:

value The float to convert to a raw int.

Returns:

the raw int value of the float

6.250.2.10 virtual float decaf::lang::Float::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.250.2.11 static float decaf::lang::Float::intBitsToFloat (int bits) [static]

Returns the float value corresponding to a given bit representation. The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "single format" bit layout.

If the argument is 0x7f800000, the result is positive infinity. If the argument is 0xff800000, the result is negative infinity. If the argument is any value in the range 0x7f800001 through 0x7fffffff or in the range 0xff800001 through 0xffffffff, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Float::floatToRawIntBits** (p. 1332) method.

Parameters:

bits - the bits of the float encoded as a float

Returns:

a new float created from the int bits.

6.250.2.12 virtual int decaf::lang::Float::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.250.2.13 `static bool decaf::lang::Float::isInfinite (float value) [static]`**Parameters:**

value - The float to check.

Returns:

true if the float is equal to infinity.

6.250.2.14 `bool decaf::lang::Float::isInfinite () const`**Returns:**

true if the float is equal to positive infinity.

6.250.2.15 `static bool decaf::lang::Float::isNaN (float value) [static]`**Parameters:**

value - The float to check.

Returns:

true if the float is equal to NaN.

6.250.2.16 `bool decaf::lang::Float::isNaN () const`**Returns:**

true if the float is equal to NaN.

6.250.2.17 `virtual long long decaf::lang::Float::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.250.2.18 `virtual bool decaf::lang::Float::operator< (const float & f) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< float > (p. 900).

6.250.2.19 **virtual bool decaf::lang::Float::operator< (const Float & *f*) const**
 [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.250.2.20 **virtual bool decaf::lang::Float::operator== (const float & *f*) const**
 [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< float > (p. 901).

6.250.2.21 **virtual bool decaf::lang::Float::operator== (const Float & *f*) const**
 [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.250.2.22 **static float decaf::lang::Float::parseFloat (const std::string & *value*)**
 throw (exceptions::NumberFormatException) [static]

Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1328).

Parameters:

value - the string to parse

Returns:

a float parsed from the string

Exceptions:

NumberFormatException

6.250.2.23 `virtual short decaf::lang::Float::shortValue () const [inline, virtual]`

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from `decaf::lang::Number` (p. 1956).

6.250.2.24 `static std::string decaf::lang::Float::toHexString (float value) [static]`

Returns a hexadecimal string representation of the float argument. All characters mentioned below are ASCII characters.

* If the argument is NaN, the result is the string "NaN". * Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a float value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to `Integer.toString` (p. 1440) on the exponent value. o If m is a float value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters:

value - The float to convert to a string

Returns:

the Hex formatted float string.

6.250.2.25 static std::string decaf::lang::Float::toString (float *value*) [static]

Returns a string representation of the float argument. All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude *m*:

- o If *m* is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity".
- o If *m* is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0".
- o If *m* is greater than or equal to 10⁻³ but less than 10⁷, then it is represented as the integer part of *m*, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of *m*.
- o If *m* is less than 10⁻³ or greater than or equal to 10⁷, then it is represented in so-called "computerized scientific notation." Let *n* be the unique integer such that 10^{*n*} ≤ *m* < 10^{*n*+1}; then let *a* be the mathematically exact quotient of *m* and 10^{*n*} so that 1 ≤ *a* < 10. The magnitude is then represented as the integer part of *a*, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of *a*, followed by the letter 'E', followed by a representation of *n* as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1440).

Parameters:

value - The float to convert to a string

Returns:

the formatted float string.

6.250.2.26 std::string decaf::lang::Float::toString () const**Returns:**

this **Float** (p. 1328) Object as a String Representation

6.250.2.27 static Float decaf::lang::Float::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Float** (p. 1328) instance that wraps a primitive float which is parsed from the string value passed.

Parameters:

value - the string to parse

Returns:

a new **Float** (p. 1328) instance wrapping the float parsed from value

Exceptions:

NumberFormatException on error.

6.250.2.28 `static Float decaf::lang::Float::valueOf (float value)` [static]

Returns a **Float** (p. 1328) instance representing the specified float value.

Parameters:

value - float to wrap

Returns:

new **Float** (p. 1328) instance wrapping the primitive value

6.250.3 **Field Documentation****6.250.3.1** `const float decaf::lang::Float::MAX_VALUE` [static]

The maximum value that the primitive type can hold.

6.250.3.2 `const float decaf::lang::Float::MIN_VALUE` [static]

The minimum value that the primitive type can hold.

6.250.3.3 `const float decaf::lang::Float::NaN` [static]

Constant for the Not a **Number** (p. 1954) Value.

6.250.3.4 `const float decaf::lang::Float::NEGATIVE_INFINITY` [static]

Constant for Negative Infinity.

6.250.3.5 `const float decaf::lang::Float::POSITIVE_INFINITY` [static]

Constant for Positive Infinity.

6.250.3.6 `const int decaf::lang::Float::SIZE = 32` [static]

The size in bits of the primitive int type.

Tells whether or not this buffer is backed by an accessible float array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual FloatBuffer & **put** (float value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual FloatBuffer & **put** (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the given index.
- virtual FloatBuffer * **slice** () const
Creates a new FloatBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **ByteBuffer** (p. 694) as Read-Only.*

6.251.1 Constructor & Destructor Documentation

6.251.1.1 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **FloatArrayBuffer** (p. 1339) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

6.251.1.2 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (float * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **FloatArrayBuffer** (p. 1339) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.251.1.3 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset. The capacity and limit of the new **FloatArrayBuffer** (p.1339) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 729) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.251.1.4 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (const FloatArrayBuffer & other)

Create a **FloatArrayBuffer** (p. 1339) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.

Parameters:

other - the **FloatArrayBuffer** (p. 1339) this one is to mirror.

6.251.1.5 virtual decaf::internal::nio::FloatArrayBuffer::~FloatArrayBuffer () [virtual]

6.251.2 Member Function Documentation

6.251.2.1 virtual float* decaf::internal::nio::FloatArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the float array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1348).

6.251.2.2 `virtual std::size_t decaf::internal::nio::FloatArrayBuffer::arrayOffset
() throw (decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1349).

6.251.2.3 `virtual FloatBuffer* de-
caf::internal::nio::FloatArrayBuffer::asReadOnlyBuffer ()
const [virtual]`

Creates a new, read-only float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only float buffer which the caller then owns.

Implements **decaf::nio::FloatBuffer** (p. 1349).

6.251.2.4 `virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::compact ()
throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p` = `position()` (p. 631) is copied

to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index `limit()` (p. 631) - 1 is copied to index $n = \text{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this FloatBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1349).

6.251.2.5 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::duplicate ()
[virtual]

Creates a new float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new float Buffer which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1350).

6.251.2.6 virtual float decaf::internal::nio::FloatArrayBuffer::get (std::size_t index)
const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the float is to be read

Returns:

the float that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::FloatBuffer** (p. 1351).

6.251.2.7 virtual float decaf::internal::nio::FloatArrayBuffer::get () throw (
decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the float at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::FloatBuffer** (p.1352).

6.251.2.8 **virtual bool decaf::internal::nio::FloatArrayBuffer::hasArray () const** [inline, virtual]

Tells whether or not this buffer is backed by an accessible float array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::FloatBuffer** (p.1352).

6.251.2.9 **virtual bool decaf::internal::nio::FloatArrayBuffer::isReadOnly () const** [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 630).

6.251.2.10 **virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put** (std::size_t *index*, float *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p.1353).

6.251.2.11 `virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (float value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)` [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements `decaf::nio::FloatBuffer` (p.1353).

6.251.2.12 `virtual void decaf::internal::nio::FloatArrayBuffer::setReadOnly (bool value)` [inline, protected, virtual]

Sets this `ByteBuffer` (p.694) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.251.2.13 `virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::slice () const` [virtual]

Creates a new `FloatBuffer` whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create `FloatBuffer` which the caller owns.

Implements `decaf::nio::FloatBuffer` (p.1355).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/FloatArrayBuffer.h`

6.252 decaf::nio::FloatBuffer Class Reference

This class defines four categories of operations upon float buffers:.

#include <src/main/decaf/nio/FloatBuffer.h> Inheritance diagram for decaf::nio::FloatBuffer:

Public Member Functions

- virtual **~FloatBuffer** ()
- virtual std::string **toString** () const
- virtual float * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the float array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **FloatBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only float buffer that shares this buffer's content.
- virtual **FloatBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **FloatBuffer** * **duplicate** ()=0
Creates a new float buffer that shares this buffer's content.
- virtual float **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual float **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **FloatBuffer** & **get** (std::vector< float > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **FloatBuffer** & **get** (float *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible float array.
- **FloatBuffer** & **put** (**FloatBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the floats remaining in the given source buffer into this buffer.

- **FloatBuffer** & **put** (const float *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers floats into this buffer from the given source array.
- **FloatBuffer** & **put** (std::vector< float > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source floats array into this buffer.
- virtual **FloatBuffer** & **put** (float value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given floats into this buffer at the current position, and then increments the position.
- virtual **FloatBuffer** & **put** (std::size_t index, float value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given floats into this buffer at the given index.
- virtual **FloatBuffer** * **slice** () const =0
*Creates a new **FloatBuffer** (p. 1346) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **FloatBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **FloatBuffer** &value) const
- virtual bool **operator==** (const **FloatBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **FloatBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **FloatBuffer** * **allocate** (std::size_t capacity)
Allocates a new Double buffer.
- static **FloatBuffer** * **wrap** (float *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **FloatBuffer** (p. 1346).*
- static **FloatBuffer** * **wrap** (std::vector< float > &buffer)
*Wraps the passed STL float Vector in a **FloatBuffer** (p. 1346).*

Protected Member Functions

- **FloatBuffer** (std::size_t capacity)
*Creates a **FloatBuffer** (p. 1346) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.252.1 Detailed Description

This class defines four categories of operations upon float buffers:.

- o Absolute and relative get and put methods that read and write single floats;
- o Relative bulk get methods that transfer contiguous sequences of floats from this buffer into an array; and
- o Relative bulk put methods that transfer contiguous sequences of floats from a float array or some other float buffer into this buffer
- o Methods for compacting, duplicating, and slicing a float buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing float array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.252.2 Constructor & Destructor Documentation

6.252.2.1 `decaf::nio::FloatBuffer::FloatBuffer (std::size_t capacity)` [protected]

Creates a **FloatBuffer** (p. 1346) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 627) in doubles

6.252.2.2 `virtual decaf::nio::FloatBuffer::~~FloatBuffer ()` [inline, virtual]

6.252.3 Member Function Documentation

6.252.3.1 `static FloatBuffer* decaf::nio::FloatBuffer::allocate (std::size_t capacity)` [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in floats

Returns:

the **FloatBuffer** (p. 1346) that was allocated, caller owns.

6.252.3.2 `virtual float* decaf::nio::FloatBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)` [pure virtual]

Returns the float array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 627)

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1341).

6.252.3.3 virtual std::size_t decaf::nio::FloatBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1342).

6.252.3.4 virtual FloatBuffer* decaf::nio::FloatBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only float buffer which the caller then owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1342).

6.252.3.5 virtual FloatBuffer& decaf::nio::FloatBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 631) is copied

to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index `limit()` (p. 631) - 1 is copied to index $n = \text{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **FloatBuffer** (p. 1346)

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1342).

6.252.3.6 `virtual int decaf::nio::FloatBuffer::compareTo (const FloatBuffer & value)
const [virtual]`

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.252.3.7 `virtual FloatBuffer* decaf::nio::FloatBuffer::duplicate () [pure virtual]`

Creates a new float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new float **Buffer** (p. 627) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1343).

6.252.3.8 `virtual bool decaf::nio::FloatBuffer::equals (const FloatBuffer & value)
const [virtual]`

Returns:

true if this value is considered equal to the passed value.

6.252.3.9 FloatBuffer& decaf::nio::FloatBuffer::get (float * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers floats from this buffer into the given destination array. If there are fewer floats remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 632), then no bytes are transferred and a **BufferUnderflowException** (p. 661) is thrown.

Otherwise, this method copies `length` floats from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters:

buffer - pointer to an allocated buffer to fill
offset - position in the buffer to start filling
length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than `length` floats remaining in this buffer
NullPointerException if the passed buffer is null.

6.252.3.10 FloatBuffer& decaf::nio::FloatBuffer::get (std::vector< float > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than `length` floats remaining in this buffer

6.252.3.11 virtual float decaf::nio::FloatBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 627) where the float is to be read

Returns:

the float that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in `decaf::internal::nio::FloatArrayBuffer` (p. 1343).

6.252.3.12 `virtual float decaf::nio::FloatBuffer::get () throw (BufferUnderflowException)` [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the float at the current position

Exceptions:

BufferUnderflowException (p. 661) if there no more data to return

Implemented in `decaf::internal::nio::FloatArrayBuffer` (p. 1343).

6.252.3.13 `virtual bool decaf::nio::FloatBuffer::hasArray () const` [pure virtual]

Tells whether or not this buffer is backed by an accessible float array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in `decaf::internal::nio::FloatArrayBuffer` (p. 1344).

6.252.3.14 `virtual bool decaf::nio::FloatBuffer::operator< (const FloatBuffer &value) const` [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.252.3.15 `virtual bool decaf::nio::FloatBuffer::operator==(const FloatBuffer & value) const` [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.252.3.16 `virtual FloatBuffer& decaf::nio::FloatBuffer::put (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given floats into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the floats to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1344).

6.252.3.17 `virtual FloatBuffer& decaf::nio::FloatBuffer::put (float value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given floats into this buffer at the current position, and then increments the position.

Parameters:

value - the floats value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1345).

6.252.3.18 FloatBuffer& decaf::nio::FloatBuffer::put (std::vector< float > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source floats array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size())

Parameters:

buffer - The buffer whose contents are copied to this **FloatBuffer** (p. 1346)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.252.3.19 FloatBuffer& decaf::nio::FloatBuffer::put (const float * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers floats into this buffer from the given source array. If there are more floats to be copied from the array than remain in this buffer, that is, if *length* > **remaining()** (p. 632), then no floats are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies *length* bytes from the given array into this buffer, starting at the given *offset* in the array and at the current position of this buffer. The position of this buffer is then incremented by *length*.

Parameters:

buffer- The array from which floats are to be read

offset- The offset within the array of the first float to be read;

length - The number of floats to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.252.3.20 FloatBuffer& decaf::nio::FloatBuffer::put (FloatBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the floats remaining in the given source buffer into this buffer. If there are more floats remaining in the source buffer than in this buffer, that is, if *src.remaining()* >

remaining() (p. 632), then no floats are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies $n = \text{src.remaining}()$ floats from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n .

Parameters:

src - the buffer to take floats from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer for the remaining floats in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.252.3.21 virtual FloatBuffer* decaf::nio::FloatBuffer::slice () const [pure virtual]

Creates a new **FloatBuffer** (p. 1346) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **FloatBuffer** (p. 1346) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1345).

6.252.3.22 virtual std::string decaf::nio::FloatBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.252.3.23 static FloatBuffer* decaf::nio::FloatBuffer::wrap (std::vector< float > & buffer) [static]

Wraps the passed STL float Vector in a **FloatBuffer** (p. 1346). The new buffer will be backed by the given float array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new **FloatBuffer** (p. 1346) that is backed by *buffer*, caller owns.

6.252.3.24 `static FloatBuffer* decaf::nio::FloatBuffer::wrap (float *
array, std::size_t offset, std::size_t length) throw (
lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new **FloatBuffer** (p. 1346). The new buffer will be backed by the given float array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **FloatBuffer** (p. 1346) that is backed by *buffer*, caller owns.

The documentation for this class was generated from the following file:

6.253 activemq::commands::FlushCommand Class Reference

#include <src/main/activemq/commands/FlushCommand.h> Inheritance diagram for activemq::commands::FlushCommand:

Public Member Functions

- **FlushCommand** ()
- virtual **~FlushCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **FlushCommand * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID _FLUSHCOMMAND** = 15

Protected Member Functions

- **FlushCommand** (const **FlushCommand** &)
- **FlushCommand** & **operator=** (const **FlushCommand** &)

6.253.1 Constructor & Destructor Documentation

6.253.1.1 `activemq::commands::FlushCommand::FlushCommand (const FlushCommand &) [inline, protected]`

6.253.1.2 `activemq::commands::FlushCommand::FlushCommand ()`

6.253.1.3 `virtual activemq::commands::FlushCommand::~~FlushCommand () [virtual]`

6.253.2 Member Function Documentation

6.253.2.1 `virtual FlushCommand* activemq::commands::FlushCommand::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.253.2.2 `virtual void activemq::commands::FlushCommand::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.253.2.3 `virtual bool activemq::commands::FlushCommand::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.253.2.4 `virtual unsigned char activemq::commands::FlushCommand::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

6.253.2.5 **FlushCommand& activemq::commands::FlushCommand::operator=**
(const **FlushCommand** &) [inline, protected]

6.253.2.6 **virtual std::string activemq::commands::FlushCommand::toString ()**
const [virtual]

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.253.2.7 **virtual Pointer<Command> activemq::commands::FlushCommand::visit**
(activemq::state::CommandVisitor * *visitor*) throw (
exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.253.3 Field Documentation

6.253.3.1 **const unsigned char activemq::commands::FlushCommand::ID_ -**
FLUSHCOMMAND = 15 [static]

Write a object instance to data output stream.

6.254.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p.1360). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.254.2 Constructor & Destructor Documentation

6.254.2.1 `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::FlushCommandMarshaller()` [inline]

6.254.2.2 `virtual activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::~~FlushCommandMarshaller()` [inline, virtual]

6.254.3 Member Function Documentation

6.254.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.254.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.254.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.254.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.254.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.254.3.6 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.254.3.7 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**FlushCommandMarshaller.h**

6.255 activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p.1364).

#include <src/main/activemq/wireformat/openwire/marshal/v3/FlushCommandMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller:

6.255.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p.1364). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.255.2 Constructor & Destructor Documentation

6.255.2.1 `activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::FlushCommandMarshaller()` [inline]

6.255.2.2 `virtual activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::~~FlushCommandMarshaller()` [inline, virtual]

6.255.3 Member Function Documentation

6.255.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.255.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.255.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.255.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.255.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.255.3.6 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.255.3.7 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

6.256.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p.1368). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.256.2 Constructor & Destructor Documentation

6.256.2.1 `activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::FlushCommandMarshaller()` [inline]

6.256.2.2 `virtual activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::~~FlushCommandMarshaller()` [inline, virtual]

6.256.3 Member Function Documentation

6.256.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.256.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.256.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.256.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.256.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.256.3.6 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.256.3.7 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/FlushCommandMarshaller.h

6.257 decaf::util::logging::Formatter Class Reference

A **Formatter** (p. 1372) provides support for formatting LogRecords.

#include <src/main/decaf/util/logging/Formatter.h> Inheritance diagram for decaf::util::logging::Formatter:

Public Member Functions

- virtual **~Formatter** ()
- virtual std::string **format** (const **LogRecord** &record) const =0
Format the given log record and return the formatted string.
- virtual std::string **formatMessage** (const **LogRecord** &record) const =0
Format the message string from a log record.
- virtual std::string **getHead** (const **Handler** *handler)=0
Return the header string for a set of formatted records.
- virtual std::string **getTail** (const **Handler** *handler)=0
Return the tail string for a set of formatted records.

6.257.1 Detailed Description

A **Formatter** (p. 1372) provides support for formatting LogRecords. Typically each **logging** (p. 120) **Handler** (p. 1382) will have a **Formatter** (p. 1372) associated with it. The **Formatter** (p. 1372) takes a **LogRecord** (p. 1645) and converts it to a string.

Some formatters (such as the XMLFormatter) need to wrap head and tail strings around a set of formatted records. The getHeader and getTail methods can be used to obtain these strings.

6.257.2 Constructor & Destructor Documentation

6.257.2.1 virtual decaf::util::logging::Formatter::~~Formatter () [inline, virtual]

6.257.3 Member Function Documentation

6.257.3.1 virtual std::string decaf::util::logging::Formatter::format (const **LogRecord** & *record*) const [pure virtual]

Format the given log record and return the formatted string.

Parameters:

record The Log Record to Format

Returns:

the formatted record.

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2367).

6.257.3.2 virtual std::string decaf::util::logging::Formatter::formatMessage (const LogRecord & *record*) const [pure virtual]

Format the message string from a log record.

Parameters:

record The Log Record to Format

Returns:

the formatted message

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2368).

6.257.3.3 virtual std::string decaf::util::logging::Formatter::getHead (const Handler * *handler*) [pure virtual]

Return the header string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

the head string

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2368).

6.257.3.4 virtual std::string decaf::util::logging::Formatter::getTail (const Handler * *handler*) [pure virtual]

Return the tail string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

the tail string

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2368).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Formatter.h**

6.258 decaf::util::concurrent::Future< V > Class Template Reference

A **Future** (p. 1374) represents the result of an asynchronous computation.

```
#include <src/main/decaf/util/concurrent/Future.h>
```

Public Member Functions

- virtual **~Future** ()
- bool **cancel** (bool mayInterruptIfRunning)=0
Attempts to cancel execution of this task.
- bool **isCancelled** () const =0
Returns true if this task was canceled before it completed normally.
- bool **isDone** () const =0
Returns true if this task completed.
- V **get** ()=0 throw (CancellationException, InterruptedException, ExecutionException)
Waits if necessary for the computation to complete, and then retrieves its result.
- V **get** (long long timeout, **TimeUnit** unit)=0 throw (InterruptedException, ExecutionException, TimeoutException)
Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

6.258.1 Detailed Description

```
template<typename V> class decaf::util::concurrent::Future< V >
```

A **Future** (p. 1374) represents the result of an asynchronous computation. Methods are provided to check if the computation is complete, to wait for its completion, and to retrieve the result of the computation. The result can only be retrieved using method **get** when the computation has completed, blocking if necessary until it is ready. Cancellation is performed by the **cancel** method. Additional methods are provided to determine if the task completed normally or was canceled. Once a computation has completed, the computation cannot be canceled. If you would like to use a **Future** (p. 1374) for the sake of cancellability but not provide a usable result, you can declare types of the form **Future<void*>** and return null as a result of the underlying task.

6.258.2 Constructor & Destructor Documentation

6.258.2.1 `template<typename V > virtual decaf::util::concurrent::Future< V >::~~Future () [inline, virtual]`

6.258.3 Member Function Documentation

6.258.3.1 `template<typename V > bool decaf::util::concurrent::Future< V >::cancel (bool mayInterruptIfRunning) [pure virtual]`

Attempts to cancel execution of this task. This attempt will fail if the task has already completed, has already been canceled, or could not be canceled for some other reason. If successful, and this task has not started when cancel is called, this task should never run. If the task has already started, then the *mayInterruptIfRunning* parameter determines whether the thread executing this task should be interrupted in an attempt to stop the task.

After this method returns, subsequent calls to **isDone()** (p. 1376) will always return true. Subsequent calls to **isCancelled()** (p. 1376) will always return true if this method returned true.

Parameters:

mayInterruptIfRunning - true if the thread executing this task should be interrupted; otherwise, in-progress tasks are allowed to complete.

Returns:

false if the task could not be canceled, typically because it has already completed normally;
true otherwise

6.258.3.2 `template<typename V > V decaf::util::concurrent::Future< V >::get (long long timeout, TimeUnit unit) throw (InterruptedException, ExecutionException, TimeoutException) [pure virtual]`

Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

Parameters:

timeout - the maximum time to wait

unit - the time unit of the timeout argument

Returns:

the computed result

Exceptions:

CancellationException (p. 784) - if the computation was canceled

ExecutionException (p. 1291) - if the computation threw an exception

InterruptedException - if the current thread was interrupted while waiting

TimeoutException (p. 2559) - if the wait timed out

6.258.3.3 `template<typename V > V decaf::util::concurrent::Future< V
>::get () throw (CancellationException, InterruptedException,
ExecutionException) [pure virtual]`

Waits if necessary for the computation to complete, and then retrieves its result.

Returns:

the computed result.

Exceptions:

CancellationException (p. 784) - if the computation was canceled
ExecutionException (p. 1291) - if the computation threw an exception
InterruptedException - if the current thread was interrupted while waiting

6.258.3.4 `template<typename V > bool decaf::util::concurrent::Future< V
>::isCancelled () const [pure virtual]`

Returns true if this task was canceled before it completed normally.

Returns:

true if this task was canceled before it completed

6.258.3.5 `template<typename V > bool decaf::util::concurrent::Future< V
>::isDone () const [pure virtual]`

Returns true if this task completed. Completion may be due to normal termination, an exception, or cancellation -- in all of these cases, this method will return true.

Returns:

true if this task completed

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Future.h`

6.259 activemq::transport::correlator::FutureResponse Class Reference

A container that holds a response object.

```
#include <src/main/activemq/transport/correlator/FutureResponse.h>
```

Public Member Functions

- **FutureResponse** ()
- virtual **~FutureResponse** ()
- virtual const **Pointer**< **Response** > & **getResponse** () const
Getters for the response property.
- virtual **Pointer**< **Response** > & **getResponse** ()
- virtual const **Pointer**< **Response** > & **getResponse** (unsigned int timeout) const
Getters for the response property.
- virtual **Pointer**< **Response** > & **getResponse** (unsigned int timeout)
- virtual void **setResponse** (const **Pointer**< **Response** > &response)
Setter for the response property.

6.259.1 Detailed Description

A container that holds a response object. Callers of the `getResponse` method will block until a response has been receive unless they call the `getRepsonse` that takes a timeout.

6.259.2 Constructor & Destructor Documentation

6.259.2.1 `activemq::transport::correlator::FutureResponse::FutureResponse ()`
[inline]

6.259.2.2 `virtual`
`activemq::transport::correlator::FutureResponse::~~FutureResponse ()`
[inline, virtual]

6.259.3 Member Function Documentation

6.259.3.1 `virtual` `Pointer`<`Response`>& `activemq::transport::correlator::FutureResponse::getResponse (unsigned int timeout)` [inline, virtual]

6.259.3.2 `virtual` const `Pointer`<`Response`>& `activemq::transport::correlator::FutureResponse::getResponse (unsigned int timeout)` const [inline, virtual]

Getters for the response property. Timed Wait.

Parameters:

timeout - time to wait in milliseconds

Returns:

the response object for the request

6.259.3.3 `virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse () [inline, virtual]`

6.259.3.4 `virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse () const [inline, virtual]`

Getters for the response property. Infinite Wait.

Returns:

the response object for the request

6.259.3.5 `virtual void activemq::transport::correlator::FutureResponse::setResponse (const Pointer< Response > & response) [inline, virtual]`

Setter for the response property.

Parameters:

response the response object for the request.

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/correlator/FutureResponse.h`

6.260 decaf::security::GeneralSecurityException Class Reference

#include <src/main/decaf/security/GeneralSecurityException.h> Inheritance diagram for decaf::security::GeneralSecurityException:

Public Member Functions

- **GeneralSecurityException** () throw ()
Default Constructor.
- **GeneralSecurityException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **GeneralSecurityException** (const **GeneralSecurityException** &ex) throw ()
Copy Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **GeneralSecurityException** (const std::exception *cause) throw ()
Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **GeneralSecurityException** * clone () const
Clones this exception.
- virtual ~**GeneralSecurityException** () throw ()

6.260.1 Constructor & Destructor Documentation

6.260.1.1 decaf::security::GeneralSecurityException::GeneralSecurityException () throw () [inline]

Default Constructor.

6.260.1.2 decaf::security::GeneralSecurityException::GeneralSecurityException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.260.1.3 decaf::security::GeneralSecurityException::GeneralSecurityException (const GeneralSecurityException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.260.1.4 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.260.1.5 decaf::security::GeneralSecurityException::GeneralSecurityException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.260.1.6 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.260.1.7 `virtual`
`decaf::security::GeneralSecurityException::~~GeneralSecurityException ()`
`throw ()` [`inline`, `virtual`]

6.260.2 Member Function Documentation

6.260.2.1 `virtual GeneralSecurityException* de-`
`caf::security::GeneralSecurityException::clone () const`
`[inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented in `decaf::security::cert::CertificateEncodingException`
 (p. 792), `decaf::security::cert::CertificateException` (p. 794), `de-`
`caf::security::cert::CertificateExpiredException` (p. 796), `de-`
`caf::security::cert::CertificateNotYetValidException` (p. 798), `de-`
`caf::security::cert::CertificateParsingException` (p. 800), `de-`
`caf::security::InvalidKeyException` (p. 1469), `decaf::security::KeyException`
 (p. 1574), `decaf::security::NoSuchAlgorithmException` (p. 1944),
`decaf::security::NoSuchProviderException` (p. 1950), and `de-`
`caf::security::SignatureException` (p. 2366).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/GeneralSecurityException.h`

6.261 decaf::util::logging::Handler Class Reference

A **Handler** (p.1382) object takes log messages from a **Logger** (p.1623) and exports them.

#include <src/main/decaf/util/logging/Handler.h> Inheritance diagram for decaf::util::logging::Handler:

Public Member Functions

- virtual **~Handler** ()
- virtual void **flush** ()=0
Flush the Handler's output, clears any buffers.
- virtual void **publish** (const **LogRecord** &record)=0
*Publish the Log Record to this **Handler** (p.1382).*
- virtual void **isLoggable** (const **LogRecord** &record)=0
*Check if this **Handler** (p.1382) would actually log a given **LogRecord** (p.1645).*
- virtual void **setFilter** (const **Filter** *filter)=0
*Sets the **Filter** (p.1314) that this **Handler** (p.1382) uses to filter Log Records.*
- virtual const **Filter** * **getFilter** ()=0
*Gets the **Filter** (p.1314) that this **Handler** (p.1382) uses to filter Log Records.*
- virtual void **setLevel** (**Level** value)=0
***Set** (p.2320) the log level specifying which message levels will be logged by this **Handler** (p.1382).*
- virtual **Level** **getLevel** ()=0
*Get the log level specifying which message levels will be logged by this **Handler** (p.1382).*
- virtual void **setFormatter** (const **Formatter** *formatter)=0
*Sets the **Formatter** (p.1372) used by this **Handler** (p.1382).*
- virtual const **Formatter** * **getFormatter** ()=0
*Gets the **Formatter** (p.1372) used by this **Handler** (p.1382).*

6.261.1 Detailed Description

A **Handler** (p.1382) object takes log messages from a **Logger** (p.1623) and exports them. It might for example, write them to a console or write them to a file, or send them to a network **logging** (p.120) service, or forward them to an OS log, or whatever.

A **Handler** (p.1382) can be disabled by doing a **setLevel**(**Level**.OFF) and can be re-enabled by doing a **setLevel** with an appropriate level.

Handler (p.1382) classes typically use **LogManager** (p.1640) properties to set default values for the Handler's **Filter** (p.1314), **Formatter** (p.1372), and **Level**. See the specific documentation for each concrete **Handler** (p.1382) class.

6.261.2 Constructor & Destructor Documentation

6.261.2.1 virtual decaf::util::logging::Handler::~~Handler () [inline, virtual]

6.261.3 Member Function Documentation

6.261.3.1 virtual void decaf::util::logging::Handler::flush () [pure virtual]

Flush the Handler's output, clears any buffers.

Implemented in **decaf::util::logging::StreamHandler** (p. 2473).

6.261.3.2 virtual const Filter* decaf::util::logging::Handler::getFilter () [pure virtual]

Gets the **Filter** (p. 1314) that this **Handler** (p. 1382) uses to filter Log Records.

Returns:

Filter (p. 1314) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 2473).

6.261.3.3 virtual const Formatter* decaf::util::logging::Handler::getFormatter () [pure virtual]

Gets the **Formatter** (p. 1372) used by this **Handler** (p. 1382).

Returns:

Filter (p. 1314) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 2474).

6.261.3.4 virtual Level decaf::util::logging::Handler::getLevel () [pure virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1382).

Returns:

Level enumeration value

Implemented in **decaf::util::logging::StreamHandler** (p. 2474).

6.261.3.5 virtual void decaf::util::logging::Handler::isLoggable (const LogRecord & record) [pure virtual]

Check if this **Handler** (p. 1382) would actually log a given **LogRecord** (p. 1645). This method checks if the **LogRecord** (p. 1645) has an appropriate **Level** and whether it satisfies any **Filter** (p. 1314). It also may make other **Handler** (p. 1382) specific checks that might prevent a handler from **logging** (p. 120) the **LogRecord** (p. 1645).

Parameters:

record LogRecord (p. 1645) to check

Implemented in **decaf::util::logging::StreamHandler** (p. 2474).

6.261.3.6 virtual void decaf::util::logging::Handler::publish (const LogRecord & *record*) [pure virtual]

Publish the Log Record to this **Handler** (p. 1382).

Parameters:

record The Log Record to Publish

Implemented in **decaf::util::logging::StreamHandler** (p. 2474).

6.261.3.7 virtual void decaf::util::logging::Handler::setFilter (const Filter * *filter*) [pure virtual]

Sets the **Filter** (p. 1314) that this **Handler** (p. 1382) uses to filter Log Records. For each call of publish the **Handler** (p. 1382) will call this **Filter** (p. 1314) (if it is non-null) to check if the **LogRecord** (p. 1645) should be published or discarded.

Parameters:

filter Filter (p. 1314) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 2475).

6.261.3.8 virtual void decaf::util::logging::Handler::setFormatter (const Formatter * *formatter*) [pure virtual]

Sets the **Formatter** (p. 1372) used by this **Handler** (p. 1382). Some Handlers may not use Formatters, in which case the **Formatter** (p. 1372) will be remembered, but not used.

Parameters:

formatter Filter (p. 1314) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 2475).

6.261.3.9 virtual void decaf::util::logging::Handler::setLevel (Level *value*) [pure virtual]

Set (p. 2320) the log level specifying which message levels will be logged by this **Handler** (p. 1382). The intention is to allow developers to turn on voluminous **logging** (p. 120), but to limit the messages that are sent to certain Handlers.

Parameters:

value Level enumeration value

Implemented in **decaf::util::logging::StreamHandler** (p. 2475).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/Handler.h`

6.262 decaf::internal::util::HexStringParser Class Reference

```
#include <src/main/decaf/internal/util/HexStringParser.h>
```

Public Member Functions

- **HexStringParser** (int exponentWidth, int mantissaWidth)
Create a new HexParser.
- virtual **~HexStringParser** ()
- long long **parse** (const std::string &hexString)
Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or double as needed.

Static Public Member Functions

- static double **parseDouble** (const std::string &hexString)
- static float **parseFloat** (const std::string &hexString)

6.262.1 Constructor & Destructor Documentation

6.262.1.1 decaf::internal::util::HexStringParser::HexStringParser (int exponentWidth, int mantissaWidth)

Create a new HexParser.

Parameters:

exponentWidth - Width of the exponent for the type to parse
mantissaWidth - Width of the mantissa for the type to parse

6.262.1.2 virtual decaf::internal::util::HexStringParser::~~HexStringParser () [inline, virtual]

6.262.2 Member Function Documentation

6.262.2.1 long long decaf::internal::util::HexStringParser::parse (const std::string &hexString)

Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or double as needed.

Parameters:

hexString - string to parse

Returns:

the bits parsed from the string

6.262.2.2 static double decaf::internal::util::HexStringParser::parseDouble (const std::string & *hexString*) [static]

6.262.2.3 static float decaf::internal::util::HexStringParser::parseFloat (const std::string & *hexString*) [static]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**HexStringParser.h**

6.263 activemq::wireformat::openwire::utils::HexTable Class Reference

The **HexTable** (p. 1388) class maps hexadecimal strings to the value of an index into the table, i.e.

```
#include <src/main/activemq/wireformat/openwire/utils/HexTable.h>
```

Public Member Functions

- **HexTable** ()
- virtual **~HexTable** ()
- virtual const std::string & **operator[]** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

- virtual const std::string & **operator[]** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual std::size_t **size** () const

Returns the max size of this Table.

6.263.1 Detailed Description

The **HexTable** (p. 1388) class maps hexadecimal strings to the value of an index into the table, i.e. the class will return "FF" for the index 255 in the table.

6.263.2 Constructor & Destructor Documentation

6.263.2.1 activemq::wireformat::openwire::utils::HexTable::HexTable ()

6.263.2.2 virtual activemq::wireformat::openwire::utils::HexTable::~~HexTable ()
[inline, virtual]

6.263.3 Member Function Documentation

6.263.3.1 virtual const std::string&
activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t
index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException
) [virtual]

6.263.3.2 virtual const std::string&
activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t
index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

Parameters:

index The index of the value in the table to fetch.

Returns:

string containing the hex value if the index

Exceptions:

IndexOutOfBoundsException

6.263.3.3 virtual std::size_t activemq::wireformat::openwire::utils::HexTable::size
() const [inline, virtual]

Returns the max size of this Table.

Returns:

an integer size value

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/utils/**HexTable.h**

6.264 decaf::net::HttpRetryException Class Reference

#include <src/main/decaf/net/HttpRetryException.h> Inheritance diagram for decaf::net::HttpRetryException:

Public Member Functions

6.264.1 Constructor & Destructor Documentation

6.264.1.1 decaf::net::HttpRetryException::HttpRetryException () throw () [inline]

Default Constructor.

6.264.1.2 decaf::net::HttpRetryException::HttpRetryException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.264.1.3 decaf::net::HttpRetryException::HttpRetryException (const HttpRetryException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.264.1.4 decaf::net::HttpRetryException::HttpRetryException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.264.1.5 decaf::net::HttpRetryException::HttpRetryException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.264.1.6 decaf::net::HttpRetryException::HttpRetryException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.264.1.7 `virtual decaf::net::HttpRetryException::~~HttpRetryException () throw
() [inline, virtual]`

6.264.2 Member Function Documentation

6.264.2.1 `virtual HttpRetryException* decaf::net::HttpRetryException::clone ()
const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/HttpRetryException.h`

6.265.1 Constructor & Destructor Documentation

6.265.1.1 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException () throw () [inline]

Default Constructor.

6.265.1.2 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.265.1.3 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const IllegalArgumentException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.265.1.4 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.265.1.5 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.265.1.6 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.268.1 Constructor & Destructor Documentation

6.268.1.1 decaf::lang::exceptions::IllegalStateException::IllegalStateException () throw () [inline]

Default Constructor.

6.268.1.2 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.268.1.3 decaf::lang::exceptions::IllegalStateException::IllegalStateException
(const IllegalStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.268.1.4 decaf::lang::exceptions::IllegalStateException::IllegalStateException
(const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.268.1.5 decaf::lang::exceptions::IllegalStateException::IllegalStateException
(const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.268.1.6 decaf::lang::exceptions::IllegalStateException::IllegalStateException
(const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.268.1.7 **virtual**
decaf::lang::exceptions::IllegalStateException::~~IllegalStateException ()

6.269.1 Constructor & Destructor Documentation

6.269.1.1 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException () throw () [inline]

Default Constructor.

6.269.1.2 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.269.1.3 `decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const IndexOutOfBoundsException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.269.1.4 `decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.269.1.5 `decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.269.1.6 `decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.269.1.7 virtual
decaf::lang::exceptions::IndexOutOfBoundsException::~IndexOutOfBoundsException
() throw () [inline, virtual]

6.269.2 Member Function Documentation

6.269.2.1 virtual IndexOutOfBoundsException* decaf::lang::exceptions::IndexOutOfBoundsException::clone
() const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1268) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**IndexOutOfBoundsException.h**

6.270 decaf::io::InputStream Class Reference

Base interface for an input stream.

```
#include <src/main/decaf/io/InputStream.h>
Inheritance diagram for decaf::io::InputStream:
```

Public Member Functions

- virtual **~InputStream** ()
- virtual void **mark** (int readLimit)=0

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** ()=0 throw (IOException)

Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const =0

Determines if this input stream supports the mark and reset methods.
- virtual std::size_t **available** () const =0 throw (IOException)

Indicates the number of bytes available.
- virtual unsigned char **read** ()=0 throw (IOException)

Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize)=0 throw (IOException, lang::exceptions::NullPointerException)

Reads an array of bytes from the buffer.
- virtual std::size_t **skip** (std::size_t num)=0 throw (io::IOException, lang::exceptions::UnsupportedOperationException)

Skips over and discards n bytes of data from this input stream.

6.270.1 Detailed Description

Base interface for an input stream.

6.270.2 Constructor & Destructor Documentation

6.270.2.1 virtual decaf::io::InputStream::~~InputStream () [inline, virtual]

6.270.3 Member Function Documentation

6.270.3.1 virtual std::size_t decaf::io::InputStream::available () const throw (IOException) [pure virtual]

Indicates the number of bytes available.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException (p. 1477) if an error occurs.

Implemented in `decaf::internal::io::StandardInputStream` (p. 2404), `decaf::io::BlockingByteArrayInputStream` (p. 568), `decaf::io::BufferedInputStream` (p. 634), `decaf::io::ByteArrayInputStream` (p. 718), `decaf::io::FilterInputStream` (p. 1317), and `decaf::net::SocketInputStream` (p. 2385).

6.270.3.2 virtual void decaf::io::InputStream::mark (int *readLimit*) [pure virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implemented in `decaf::internal::io::StandardInputStream` (p. 2405), `decaf::io::BlockingByteArrayInputStream` (p. 568), `decaf::io::BufferedInputStream` (p. 635), `decaf::io::ByteArrayInputStream` (p. 718), `decaf::io::FilterInputStream` (p. 1318), and `decaf::net::SocketInputStream` (p. 2386).

6.270.3.3 virtual bool decaf::io::InputStream::markSupported () const [pure virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implemented in `decaf::internal::io::StandardInputStream` (p. 2405), `decaf::io::BlockingByteArrayInputStream` (p. 569), `decaf::io::BufferedInputStream` (p. 635), `decaf::io::ByteArrayInputStream` (p. 719), `decaf::io::FilterInputStream` (p. 1318), and `decaf::net::SocketInputStream` (p. 2386).

6.270.3.4 `virtual int decaf::io::InputStream::read (unsigned char * buffer,
std::size_t offset, std::size_t bufferSize) throw (IOException,
lang::exceptions::NullPointerException) [pure virtual]`

Reads an array of bytes from the buffer. Blocks until the requested number of bytes are available.

Parameters:

buffer (out) the target buffer.

offset the position in the buffer to start reading from.

bufferSize the size of the output buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException if buffer is null

Implemented in `activemq::io::LoggingInputStream` (p. 1633), `decaf::internal::io::StandardInputStream` (p. 2406), `decaf::io::BlockingByteArrayInputStream` (p. 569), `decaf::io::BufferedInputStream` (p. 635), `decaf::io::ByteArrayInputStream` (p. 719), `decaf::io::DataInputStream` (p. 1118), `decaf::io::FilterInputStream` (p. 1319), and `decaf::net::SocketInputStream` (p. 2387).

6.270.3.5 `virtual unsigned char decaf::io::InputStream::read () throw (IOException
) [pure virtual]`

Reads a single byte from the buffer. Blocks until data is available.

Returns:

The next byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implemented in `activemq::io::LoggingInputStream` (p. 1634), `decaf::internal::io::StandardInputStream` (p. 2406), `decaf::io::BlockingByteArrayInputStream` (p. 570), `decaf::io::BufferedInputStream` (p. 636), `decaf::io::ByteArrayInputStream` (p. 720), `decaf::io::FilterInputStream` (p. 1319), and `decaf::net::SocketInputStream` (p. 2387).

6.270.3.6 `virtual void decaf::io::InputStream::reset () throw (IOException) [pure
virtual]`

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an *IOException* (p. 1477)

might be thrown. * If such an **IOException** (p. 1477) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1477). * If an **IOException** (p. 1477) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException (p. 1477)

Implemented in **decaf::internal::io::StandardInputStream** (p. 2406), **decaf::io::BlockingByteArrayInputStream** (p. 570), **decaf::io::BufferedInputStream** (p. 636), **decaf::io::ByteArrayInputStream** (p. 720), **decaf::io::FilterInputStream** (p. 1320), and **decaf::net::SocketInputStream** (p. 2388).

6.270.3.7 virtual std::size_t decaf::io::InputStream::skip (std::size_t *num*) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
[pure virtual]

Skips over and discards *n* bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If *n* is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1406) creates a byte array and then repeatedly reads into it until *n* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num - the number of bytes to skip

Returns:

total bytes skipped

Exceptions:

IOException (p. 1477) if an error occurs

Implemented in **decaf::internal::io::StandardInputStream** (p. 2407), **decaf::io::BlockingByteArrayInputStream** (p. 571), **decaf::io::BufferedInputStream** (p. 636), **decaf::io::ByteArrayInputStream** (p. 721), **decaf::io::DataInputStream** (p. 1124), **decaf::io::FilterInputStream** (p. 1320), and **decaf::net::SocketInputStream** (p. 2388).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InputStream.h**

6.271 decaf::internal::nio::IntArrayBuffer Class Reference

#include <src/main/decaf/internal/nio/IntArrayBuffer.h> Inheritance diagram for decaf::internal::nio::IntArrayBuffer:

Public Member Functions

- **IntArrayBuffer** (std::size_t capacity, bool readOnly=false)
*Creates a **IntArrayBuffer** (p. 1410) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **IntArrayBuffer** (int *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)
*Creates a **IntArrayBuffer** (p. 1410) object that wraps the given array.*
- **IntArrayBuffer** (ByteArrayPerspective &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset.*
- **IntArrayBuffer** (const IntArrayBuffer &other)
*Create a **IntArrayBuffer** (p. 1410) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.*
- virtual ~**IntArrayBuffer** ()
- virtual int * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the int array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual IntBuffer * **asReadOnlyBuffer** () const
Creates a new, read-only int buffer that shares this buffer's content.
- virtual IntBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)
Compacts this buffer.
- virtual IntBuffer * **duplicate** ()
Creates a new int buffer that shares this buffer's content.
- virtual int **get** () throw (decaf::nio::BufferUnderflowException)
Relative get method.
- virtual int **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual bool **hasArray** () const
Tells whether or not this buffer is backed by an accessible int array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual IntBuffer & **put** (int value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual IntBuffer & **put** (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the given index.
- virtual IntBuffer * **slice** () const
Creates a new IntBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this *ByteArrayBuffer* (p. 694) as Read-Only.*

6.271.1 Constructor & Destructor Documentation

6.271.1.1 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **IntArrayBuffer** (p. 1410) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

6.271.1.2 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **IntArrayBuffer** (p. 1410) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.271.1.3 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset. The capacity and limit of the new **IntArrayBuffer** (p. 1410) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 729) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.271.1.4 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const IntArrayBuffer & other)`

Create a **IntArrayBuffer** (p. 1410) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.

Parameters:

other - the **IntArrayBuffer** (p. 1410) this one is to mirror.

6.271.1.5 `virtual decaf::internal::nio::IntArrayBuffer::~~IntArrayBuffer () [virtual]`

6.271.2 Member Function Documentation

6.271.2.1 `virtual int* decaf::internal::nio::IntArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the int array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1419).

6.271.2.2 `virtual std::size_t decaf::internal::nio::IntArrayBuffer::arrayOffset ()
throw (decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1420).

6.271.2.3 `virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::asReadOnlyBuffer
() const [virtual]`

Creates a new, read-only int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only int buffer which the caller then owns.

Implements **decaf::nio::IntBuffer** (p. 1420).

6.271.2.4 `virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::compact () throw
(decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 631) is copied

to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index **limit()** (p. 631) - 1 is copied to index $n = \text{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this `IntBuffer`

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1420).

6.271.2.5 `virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::duplicate ()`
[virtual]

Creates a new int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new int Buffer which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1421).

6.271.2.6 `virtual int decaf::internal::nio::IntArrayBuffer::get (std::size_t index)`
`const throw (lang::exceptions::IndexOutOfBoundsException)` [virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the int is to be read

Returns:

the int that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::IntBuffer** (p. 1422).

6.271.2.7 `virtual int decaf::internal::nio::IntArrayBuffer::get () throw (`
`decaf::nio::BufferUnderflowException)` [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the int at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::IntBuffer** (p. 1423).

6.271.2.8 virtual bool decaf::internal::nio::IntArrayBuffer::hasArray () const
[inline, virtual]

Tells whether or not this buffer is backed by an accessible int array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::IntBuffer** (p. 1423).

6.271.2.9 virtual bool decaf::internal::nio::IntArrayBuffer::isReadOnly () const
[inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 630).

6.271.2.10 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1424).

6.271.2.11 `virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (int value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements `decaf::nio::IntBuffer` (p. 1424).

6.271.2.12 `virtual void decaf::internal::nio::IntArrayBuffer::setReadOnly (bool value) [inline, protected, virtual]`

Sets this `ByteBuffer` (p. 694) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.271.2.13 `virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::slice () const [virtual]`

Creates a new `IntBuffer` whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create `IntBuffer` which the caller owns.

Implements `decaf::nio::IntBuffer` (p. 1426).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/IntArrayBuffer.h`

6.272 decaf::nio::IntBuffer Class Reference

This class defines four categories of operations upon int buffers:.

#include <src/main/decaf/nio/IntBuffer.h>Inheritance diagram for decaf::nio::IntBuffer:

Public Member Functions

- virtual **~IntBuffer** ()
- virtual std::string **toString** () const
- virtual int * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the int array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **IntBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only int buffer that shares this buffer's content.
- virtual **IntBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **IntBuffer** * **duplicate** ()=0
Creates a new int buffer that shares this buffer's content.
- virtual int **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual int **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **IntBuffer** & **get** (std::vector< int > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **IntBuffer** & **get** (int *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible int array.
- **IntBuffer** & **put** (**IntBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the ints remaining in the given source buffer into this buffer.

- **IntBuffer** & **put** (const int *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers ints into this buffer from the given source array.
- **IntBuffer** & **put** (std::vector< int > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source ints array into this buffer.
- virtual **IntBuffer** & **put** (int value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given ints into this buffer at the current position, and then increments the position.
- virtual **IntBuffer** & **put** (std::size_t index, int value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given ints into this buffer at the given index.
- virtual **IntBuffer** * **slice** () const =0
*Creates a new **IntBuffer** (p. 1417) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **IntBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **IntBuffer** &value) const
- virtual bool **operator==** (const **IntBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **IntBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **IntBuffer** * **allocate** (std::size_t capacity)
Allocates a new Double buffer.
- static **IntBuffer** * **wrap** (int *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **IntBuffer** (p. 1417).*
- static **IntBuffer** * **wrap** (std::vector< int > &buffer)
*Wraps the passed STL int Vector in a **IntBuffer** (p. 1417).*

Protected Member Functions

- **IntBuffer** (std::size_t capacity)
*Creates a **IntBuffer** (p. 1417) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.272.1 Detailed Description

This class defines four categories of operations upon int buffers: o Absolute and relative get and put methods that read and write single ints; o Relative bulk get methods that transfer contiguous sequences of ints from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of ints from a int array or some other int buffer into this buffer o Methods for compacting, duplicating, and slicing a int buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing int array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.272.2 Constructor & Destructor Documentation

6.272.2.1 decaf::nio::IntBuffer::IntBuffer (std::size_t *capacity*) [protected]

Creates a **IntBuffer** (p.1417) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p.627) in doubles

6.272.2.2 virtual decaf::nio::IntBuffer::~~IntBuffer () [inline, virtual]

6.272.3 Member Function Documentation

6.272.3.1 static IntBuffer* decaf::nio::IntBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in ints

Returns:

the **IntBuffer** (p.1417) that was allocated, caller owns.

6.272.3.2 virtual int* decaf::nio::IntBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the int array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 627)

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1412).

6.272.3.3 `virtual std::size_t decaf::nio::IntBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1413).

6.272.3.4 `virtual IntBuffer* decaf::nio::IntBuffer::asReadOnlyBuffer () const [pure virtual]`

Creates a new, read-only int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only int buffer which the caller then owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1413).

6.272.3.5 `virtual IntBuffer& decaf::nio::IntBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]`

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 631) is copied

to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index `limit()` (p. 631) - 1 is copied to index $n = \text{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **IntBuffer** (p. 1417)

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1413).

6.272.3.6 virtual int decaf::nio::IntBuffer::compareTo (const IntBuffer & value) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.272.3.7 virtual IntBuffer* decaf::nio::IntBuffer::duplicate () [pure virtual]

Creates a new int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new int **Buffer** (p. 627) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1414).

6.272.3.8 virtual bool decaf::nio::IntBuffer::equals (const IntBuffer & value) const [virtual]**Returns:**

true if this value is considered equal to the passed value.

6.272.3.9 `IntBuffer& decaf::nio::IntBuffer::get (int * buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)`

Relative bulk get method. This method transfers ints from this buffer into the given destination array. If there are fewer ints remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 632), then no bytes are transferred and a **BufferUnderflowException** (p. 661) is thrown.

Otherwise, this method copies `length` ints from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters:

buffer - pointer to an allocated buffer to fill
offset - position in the buffer to start filling
length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than `length` ints remaining in this buffer
NullPointerException if the passed buffer is null.

6.272.3.10 `IntBuffer& decaf::nio::IntBuffer::get (std::vector< int > buffer) throw (BufferUnderflowException)`

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than `length` ints remaining in this buffer

6.272.3.11 `virtual int decaf::nio::IntBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 627) where the int is to be read

Returns:

the int that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1414).

6.272.3.12 virtual int decaf::nio::IntBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the int at the current position

Exceptions:

BufferUnderflowException (p. 661) if there no more data to return

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1414).

6.272.3.13 virtual bool decaf::nio::IntBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible int array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1415).

6.272.3.14 virtual bool decaf::nio::IntBuffer::operator< (const IntBuffer & value) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.272.3.15 `virtual bool decaf::nio::IntBuffer::operator==(const IntBuffer & value) const` [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.272.3.16 `virtual IntBuffer& decaf::nio::IntBuffer::put (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given ints into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the ints to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1415).

6.272.3.17 `virtual IntBuffer& decaf::nio::IntBuffer::put (int value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given ints into this buffer at the current position, and then increments the position.

Parameters:

value - the ints value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1416).

6.272.3.18 IntBuffer& decaf::nio::IntBuffer::put (std::vector< int > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source ints array into this buffer. This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters:

buffer - The buffer whose contents are copied to this **IntBuffer** (p. 1417)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.272.3.19 IntBuffer& decaf::nio::IntBuffer::put (const int * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers ints into this buffer from the given source array. If there are more ints to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 632), then no ints are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given `offset` in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters:

buffer- The array from which ints are to be read

offset- The offset within the array of the first int to be read;

length - The number of ints to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.272.3.20 IntBuffer& decaf::nio::IntBuffer::put (IntBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the ints remaining in the given source buffer into this buffer. If there are more ints remaining in the source buffer than in this buffer, that is, if `src.remaining() >`

remaining() (p. 632), then no ints are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `n = src.remaining()` ints from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters:

src - the buffer to take ints from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer for the remaining ints in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.272.3.21 `virtual IntBuffer* decaf::nio::IntBuffer::slice () const` [pure virtual]

Creates a new **IntBuffer** (p. 1417) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **IntBuffer** (p. 1417) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1416).

6.272.3.22 `virtual std::string decaf::nio::IntBuffer::toString () const` [virtual]

Returns:

a `std::string` describing this object

6.272.3.23 `static IntBuffer* decaf::nio::IntBuffer::wrap (std::vector< int > & buffer)` [static]

Wraps the passed STL int Vector in a **IntBuffer** (p. 1417). The new buffer will be backed by the given int array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new **IntBuffer** (p.1417) that is backed by *buffer*, caller owns.

6.272.3.24 `static IntBuffer* decaf::nio::IntBuffer::wrap (int *
array, std::size_t offset, std::size_t length) throw (
lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new **IntBuffer** (p.1417). The new buffer will be backed by the given int array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **IntBuffer** (p.1417) that is backed by *buffer*, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/IntBuffer.h`

6.273 decaf::lang::Integer Class Reference

#include <src/main/decaf/lang/Integer.h> Inheritance diagram for decaf::lang::Integer:

Public Member Functions

- **Integer** (int value)
- **Integer** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Integer** ()
- virtual int **compareTo** (const **Integer** &i) const
*Compares this **Integer** (p. 1428) instance with another.*
- bool **equals** (const **Integer** &i) const
- virtual bool **operator==** (const **Integer** &i) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Integer** &i) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const int &i) const
*Compares this **Integer** (p. 1428) instance with another.*
- bool **equals** (const int &i) const
- virtual bool **operator==** (const int &i) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const int &i) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static **Integer** **decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a String into a **Integer** (p. 1428).*
- static int **reverseBytes** (int value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.
- static int **reverse** (int value)
Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.
- static int **parseInt** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed int in the radix specified by the second argument.
- static int **parseInt** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal int.
- static **Integer** **valueOf** (int value)
*Returns a **Integer** (p. 1428) instance representing the specified int value.*
- static **Integer** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Integer** (p. 1428) object holding the value given by the specified std::string.*
- static **Integer** **valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Integer** (p. 1428) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*
- static int **bitCount** (int value)
Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static std::string **toString** (int value)
Converts the int to a String representation.
- static std::string **toString** (int value, int radix)
Returns a string representation of the first argument in the radix specified by the second argument.
- static std::string **toHexString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 16.
- static std::string **toOctalString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 8.
- static std::string **toBinaryString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 2.

- static int **highestOneBit** (int value)
Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.
- static int **lowestOneBit** (int value)
Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (int value)
Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.
- static int **numberOfTrailingZeros** (int value)
Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.
- static int **rotateLeft** (int value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.
- static int **rotateRight** (int value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.
- static int **signum** (int value)
Returns the signum function of the specified int value.

Static Public Attributes

- static const int **SIZE** = 32
The size in bits of the primitive int type.
- static const int **MAX_VALUE** = (int)0x7FFFFFFF
The maximum value that the primitive type can hold.
- static const int **MIN_VALUE** = (int)0x80000000
The minimum value that the primitive type can hold.

6.273.1 Constructor & Destructor Documentation

6.273.1.1 decaf::lang::Integer::Integer (int value)

Parameters:

value The primitive value to wrap in an Integer (p. 1428) instance.

6.273.1.2 decaf::lang::Integer::Integer (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value The base 10 encoded string to decode to an `Integer` (p. 1428) and wrap.

Exceptions:

NumberFormatException

6.273.1.3 virtual decaf::lang::Integer::~~Integer () [inline, virtual]

6.273.2 Member Function Documentation

6.273.2.1 static int decaf::lang::Integer::bitCount (int *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value. This function is sometimes referred to as the population count.

Parameters:

value - the int to count

Returns:

the number of one-bits in the two's complement binary representation of the specified int value.

6.273.2.2 virtual unsigned char decaf::lang::Integer::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from `decaf::lang::Number` (p. 1954).

6.273.2.3 virtual int decaf::lang::Integer::compareTo (const int & *i*) const [virtual]

Compares this `Integer` (p. 1428) instance with another.

Parameters:

i - the `Integer` (p. 1428) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements `decaf::lang::Comparable< int >` (p. 899).

6.273.2.4 `virtual int decaf::lang::Integer::compareTo (const Integer & i) const`
[virtual]

Compares this **Integer** (p.1428) instance with another.

Parameters:

i - the **Integer** (p.1428) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.273.2.5 `static Integer decaf::lang::Integer::decode (const std::string & value)`
`throw (exceptions::NumberFormatException)` [static]

Decodes a String into a **Integer** (p.1428). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInt method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Integer** (p.1428) object containing the decoded value

Exceptions:

NumberFormatException if the string is not formatted correctly.

6.273.2.6 `virtual double decaf::lang::Integer::doubleValue () const` [inline,
virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.273.2.7 `bool decaf::lang::Integer::equals (const int & i) const` [inline, virtual]**Parameters:**

i - the **Integer** (p.1428) object to compare against.

Returns:

true if the two **Integer** (p.1428) Objects have the same value.

Implements **decaf::lang::Comparable**< **int** > (p.900).

6.273.2.8 bool decaf::lang::Integer::equals (const Integer & i) const [inline]**Parameters:**

i - the **Integer** (p.1428) object to compare against.

Returns:

true if the two **Integer** (p.1428) Objects have the same value.

6.273.2.9 virtual float decaf::lang::Integer::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.273.2.10 static int decaf::lang::Integer::highestOneBit (int value) [static]

Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

an int value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.273.2.11 virtual int decaf::lang::Integer::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.273.2.12 `virtual long long decaf::lang::Integer::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.273.2.13 `static int decaf::lang::Integer::lowestOneBit (int value) [static]`

Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

an int value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.273.2.14 `static int decaf::lang::Integer::numberOfLeadingZeros (int value) [static]`

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value. Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

$\ast \text{floor}(\log_2(x)) = 31 - \text{numberOfLeadingZeros}(x) \ast \text{ceil}(\log_2(x)) = 32 - \text{numberOfLeadingZeros}(x - 1)$

Parameters:

value - the int to be inspected

Returns:

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.273.2.15 `static int decaf::lang::Integer::numberOfTrailingZeros (int value) [static]`

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value. Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.273.2.16 `virtual bool decaf::lang::Integer::operator< (const int & i) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< int >` (p. 900).

6.273.2.17 `virtual bool decaf::lang::Integer::operator< (const Integer & i) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.273.2.18 `virtual bool decaf::lang::Integer::operator== (const int & i) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< int >` (p. 901).

6.273.2.19 `virtual bool decaf::lang::Integer::operator==(const Integer & i) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.273.2.20 `static int decaf::lang::Integer::parseInt (const std::string & s) throw (`
`exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal int. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting int value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseInt(const std::string, int)` method.

Parameters:

s - String to convert to a int

Returns:

the converted int value

Exceptions:

NumberFormatException if the string is not a int.

6.273.2.21 `static int decaf::lang::Integer::parseInt (const std::string & s, int radix)`
`throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed int in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 804) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type *NumberFormatException* is thrown if any of the following situations occurs:
* The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 808) or larger than **Character.MAX_RADIX** (p. 807). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type int.

Parameters:

s - the String containing the int representation to be parsed

radix - the radix to be used while parsing s

Returns:

the int represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If String does not contain a parsable int.

6.273.2.22 static int decaf::lang::Integer::reverse (int *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

Parameters:

value - the value whose bits are to be reversed

Returns:

the reversed bits int.

6.273.2.23 static int decaf::lang::Integer::reverseBytes (int *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

Parameters:

value - the int whose bytes we are to reverse

Returns:

the reversed int.

6.273.2.24 static int decaf::lang::Integer::rotateLeft (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits. (Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters:

value - the int to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

6.273.2.25 `static int decaf::lang::Integer::rotateRight (int value, int distance)`
[static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits. (Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: `rotateRight(val, -distance) == rotateLeft(val, distance)`. Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: `rotateRight(val, distance) == rotateRight(val, distance & 0x1F)`.

Parameters:

value - the int to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

6.273.2.26 `virtual short decaf::lang::Integer::shortValue () const` [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from `decaf::lang::Number` (p.1956).

6.273.2.27 `static int decaf::lang::Integer::signum (int value)` [static]

Returns the signum function of the specified int value. (The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters:

value - the int to be inspected

Returns:

the signum function of the specified int value.

6.273.2.28 `static std::string decaf::lang::Integer::toBinaryString (int value)`
[static]

Returns a string representation of the integer argument as an unsigned integer in base 2. The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character.

The characters '0' and '1' are used as binary digits.

Parameters:

value - the int to be translated to a binary string

Returns:

the unsigned int value as a binary string

6.273.2.29 static std::string decaf::lang::Integer::toHexString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16. The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters:

value - the int to be translated to an Octal string

Returns:

the unsigned int value as a Octal string

6.273.2.30 static std::string decaf::lang::Integer::toOctalString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 8. The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters:

value - the int to be translated to an Octal string

Returns:

the unsigned int value as a Octal string

6.273.2.31 static std::string decaf::lang::Integer::toString (int *value*, int *radix*) [static]

Returns a string representation of the first argument in the radix specified by the second argument. If the radix is smaller than **Character.MIN_RADIX** (p.808) or larger than **Character.MAX_RADIX** (p.807), then the radix 10 is used instead.

If the first argument is negative, the first element of the result is the ASCII minus character '-'. If the first argument is not negative, no sign character appears in the result.

The remaining characters of the result represent the magnitude of the first argument. If the magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the magnitude will not be the zero character. The following ASCII characters are used as digits:

0123456789abcdefghijklmnopqrstuvwxyz

Parameters:

value - the int to convert to a string

radix - the radix to format the string in

Returns:

an int formatted to the string value of the radix given.

6.273.2.32 `static std::string decaf::lang::Integer::toString (int value) [static]`

Converts the int to a String representation.

Parameters:

value The int to convert to a `std::string` instance.

Returns:

string representation

6.273.2.33 `std::string decaf::lang::Integer::toString () const`

Returns:

this `Integer` (p. 1428) Object as a String Representation

6.273.2.34 `static Integer decaf::lang::Integer::valueOf (const std::string & value, int radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Integer** (p. 1428) object holding the value extracted from the specified `std::string` when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed int in the radix specified by the second argument, exactly as if the argument were given to the `parseInt(std::string, int)` method. The result is a **Integer** (p. 1428) object that represents the int value specified by the string.

Parameters:

value - `std::string` to parse as base (*radix*)

radix - base of the string to parse.

Returns:

new **Integer** (p. 1428) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid int.

6.273.2.35 static Integer decaf::lang::Integer::valueOf (const std::string & value)
throw (exceptions::NumberFormatException) [static]

Returns a **Integer** (p. 1428) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal int, exactly as if the argument were given to the parseInt(std::string) method. The result is a **Integer** (p. 1428) object that represents the int value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Integer** (p. 1428) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal int.

6.273.2.36 static Integer decaf::lang::Integer::valueOf (int value) [inline, static]

Returns a **Integer** (p. 1428) instance representing the specified int value.

Parameters:

value - the int to wrap

Returns:

the new **Integer** (p. 1428) object wrapping value.

6.273.3 Field Documentation

6.273.3.1 const int decaf::lang::Integer::MAX_VALUE = (int)0x7FFFFFFF [static]

The maximum value that the primitive type can hold.

6.273.3.2 const int decaf::lang::Integer::MIN_VALUE = (int)0x80000000 [static]

The minimum value that the primitive type can hold.

6.273.3.3 const int decaf::lang::Integer::SIZE = 32 [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

6.274.1 Constructor & Destructor Documentation

6.274.1.1 `activemq::commands::IntegerResponse::IntegerResponse (const IntegerResponse &) [inline, protected]`

6.274.1.2 `activemq::commands::IntegerResponse::IntegerResponse ()`

6.274.1.3 `virtual activemq::commands::IntegerResponse::~~IntegerResponse () [virtual]`

6.274.2 Member Function Documentation

6.274.2.1 `virtual IntegerResponse* activemq::commands::IntegerResponse::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::Response` (p. 2232).

6.274.2.2 `virtual void activemq::commands::IntegerResponse::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::Response` (p. 2232).

6.274.2.3 `virtual bool activemq::commands::IntegerResponse::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p. 2232).

6.274.2.4 `virtual unsigned char activemq::commands::IntegerResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from **activemq::commands::Response** (p. 2233).

6.274.2.5 `virtual int activemq::commands::IntegerResponse::getResult () const`
[virtual]

6.274.2.6 `IntegerResponse& activemq::commands::IntegerResponse::operator=`
`(const IntegerResponse &) [inline, protected]`

Reimplemented from **activemq::commands::Response** (p. 2233).

6.274.2.7 `virtual void activemq::commands::IntegerResponse::setResult (int result)`
[virtual]

6.274.2.8 `virtual std::string activemq::commands::IntegerResponse::toString ()`
`const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2233).

6.274.3 Field Documentation

6.274.3.1 `const unsigned char activemq::commands::IntegerResponse::ID_-`
`INTEGERRESPONSE = 34 [static]`

6.274.3.2 `int activemq::commands::IntegerResponse::result [protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/IntegerResponse.h`

6.275 activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1445).

#include <src/main/activemq/wireformat/openwire/marshal/v2/IntegerResponseMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller:

Public Member Functions

- **IntegerResponseMarshaller** ()
- virtual **~IntegerResponseMarshaller** ()

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.275.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1445). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.275.2 Constructor & Destructor Documentation

6.275.2.1 `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::IntegerResponseMarshaller()` [inline]

6.275.2.2 `virtual activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::~~IntegerResponseMarshaller()` [inline, virtual]

6.275.3 Member Function Documentation

6.275.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.275.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.275.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242).

6.275.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.275.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2243).

6.275.3.6 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2244).

6.275.3.7 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2245).

The documentation for this class was generated from the following file:

6.276.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1449). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.276.2 Constructor & Destructor Documentation

6.276.2.1 `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::IntegerResponseMarshaller()` [inline]

6.276.2.2 `virtual activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::~~IntegerResponseMarshaller()` [inline, virtual]

6.276.3 Member Function Documentation

6.276.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.276.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2252).

6.276.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2252).

6.276.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2253).

6.276.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2253).

6.276.3.6 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2254).

6.276.3.7 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2255).

The documentation for this class was generated from the following file:

6.277.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1453). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.277.2 Constructor & Destructor Documentation

6.277.2.1 `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::IntegerResponseMarshaller()` [inline]

6.277.2.2 `virtual activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::~~IntegerResponseMarshaller()` [inline, virtual]

6.277.3 Member Function Documentation

6.277.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.277.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.277.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247).

6.277.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2248).

6.277.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2248).

6.277.3.6 virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2249).

6.277.3.7 virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2250).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**IntegerResponseMarshaller.h**

6.278 activemq::transport::mock::InternalCommandListener Class Reference

Listens for Commands sent from the **MockTransport** (p. 1910).

#include <src/main/activemq/transport/mock/InternalCommandListener.h>Inheritance diagram for activemq::transport::mock::InternalCommandListener:

Public Member Functions

- **InternalCommandListener** ()
- virtual **~InternalCommandListener** ()
- void **setTransport** (**MockTransport** *transport)
- void **setResponseBuilder** (const **Pointer**< **ResponseBuilder** > &responseBuilder)
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
Event handler for the receipt of a command.
- void **run** ()
Default implementation of the run method - does nothing.

6.278.1 Detailed Description

Listens for Commands sent from the **MockTransport** (p. 1910). This class processes all outbound **commands** (p. 59) and sends responses that are constructed by calling the Protocol provided **ResponseBuilder** (p. 2235) and getting a set of Commands to send back into the **MockTransport** (p. 1910) as incoming Commands and Responses.

6.278.2 Constructor & Destructor Documentation

6.278.2.1 **activemq::transport::mock::InternalCommandListener::InternalCommandListener** ()

6.278.2.2 **virtual**
activemq::transport::mock::InternalCommandListener::~~InternalCommandListener
 () [virtual]

6.278.3 Member Function Documentation

6.278.3.1 **virtual void** **activemq::transport::mock::InternalCommandListener::onCommand** (const **Pointer**< **Command** > & *command*) [virtual]

Event handler for the receipt of a command. The **transport** (p. 67) passes off all received **commands** (p. 59) to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2608) deletes the command upon receipt.

Parameters:

command the received command object.

Implements **activemq::transport::TransportListener** (p. 2624).

6.278.3.2 `void activemq::transport::mock::InternalCommandListener::run ()`
[virtual]

Default implementation of the run method - does nothing.

Reimplemented from **decaf::lang::Thread** (p. 2545).

6.278.3.3 `void activemq::transport::mock::InternalCommandListener::setResponseBuilder`
`(const Pointer< ResponseBuilder > & responseBuilder)` [inline]

6.278.3.4 `void activemq::transport::mock::InternalCommandListener::setTransport`
`(MockTransport * transport)` [inline]

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/mock/InternalCommandListener.h`

6.279 decaf::lang::exceptions::InterruptedException Class Reference

#include <src/main/decaf/lang/exceptions/InterruptedException.h> Inheritance diagram for decaf::lang::exceptions::InterruptedException:

Public Member Functions

- **InterruptedException** () throw ()
Default Constructor.
- **InterruptedException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1268).*
- **InterruptedException** (const **InterruptedException** &ex) throw ()
Copy Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedException** (const std::exception *cause) throw ()
Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **InterruptedException** * **clone** () const
Clones this exception.
- virtual ~**InterruptedException** () throw ()

6.279.1 Constructor & Destructor Documentation

6.279.1.1 decaf::lang::exceptions::InterruptedException::InterruptedException () throw () [inline]

Default Constructor.

6.279.1.2 decaf::lang::exceptions::InterruptedException::InterruptedException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.279.1.3 `decaf::lang::exceptions::InterruptedException::InterruptedException`
`(const InterruptedException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.279.1.4 `decaf::lang::exceptions::InterruptedException::InterruptedException`
`(const char * file, const int lineNumber, const std::exception * cause,
const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.279.1.5 `decaf::lang::exceptions::InterruptedException::InterruptedException`
`(const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.279.1.6 `decaf::lang::exceptions::InterruptedException::InterruptedException`
`(const char * file, const int lineNumber, const char * msg, ...) throw ()
[inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.279.1.7 virtual
decaf::lang::exceptions::InterruptedException::~~InterruptedException ()
throw () [inline, virtual]

6.279.2 Member Function Documentation

6.279.2.1 virtual InterruptedException* decaf::lang::exceptions::InterruptedException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1268) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**InterruptedException.h**

6.280 decaf::io::InterruptedIOException Class Reference

#include <src/main/decaf/io/InterruptedIOException.h> Inheritance diagram for decaf::io::InterruptedIOException:

Public Member Functions

- **InterruptedIOException** () throw ()
Default Constructor.
- **InterruptedIOException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **InterruptedIOException** (const InterruptedIOException &ex) throw ()
Copy Constructor.
- **InterruptedIOException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedIOException** (const std::exception *cause) throw ()
Constructor.
- **InterruptedIOException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **InterruptedIOException * clone** () const
Clones this exception.
- virtual **~InterruptedIOException** () throw ()

6.280.1 Constructor & Destructor Documentation

6.280.1.1 decaf::io::InterruptedIOException::InterruptedIOException () throw () [inline]

Default Constructor.

6.280.1.2 decaf::io::InterruptedIOException::InterruptedIOException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy

6.280.1.3 decaf::io::InterruptedIOException::InterruptedIOException (const InterruptedIOException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.280.1.4 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.280.1.5 decaf::io::InterruptedIOException::InterruptedIOException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.280.1.6 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.280.1.7 `virtual decaf::io::InterruptedIOException::~~InterruptedIOException ()
throw () [inline, virtual]`

6.280.2 Member Function Documentation

6.280.2.1 `virtual InterruptedIOException* decaf::io::InterruptedIOException::clone
() const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1479).

Reimplemented in **decaf::net::SocketTimeoutException** (p. 2397).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/InterruptedIOException.h`

6.281 cms::InvalidClientIdException Class Reference

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

#include <src/main/cms/InvalidClientIdException.h> Inheritance diagram for cms::InvalidClientIdException:

Public Member Functions

- **InvalidClientIdException** () throw ()

6.283.1 Constructor & Destructor Documentation

6.283.1.1 decaf::security::InvalidKeyException::InvalidKeyException () throw () [inline]

Default Constructor.

6.283.1.2 decaf::security::InvalidKeyException::InvalidKeyException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.283.1.3 decaf::security::InvalidKeyException::InvalidKeyException (const InvalidKeyException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.283.1.4 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.283.1.5 decaf::security::InvalidKeyException::InvalidKeyException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.283.1.6 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.283.1.7 virtual decaf::security::InvalidKeyException::~~InvalidKeyException ()
throw () [inline, virtual]

6.283.2 Member Function Documentation

6.283.2.1 virtual InvalidKeyException* decaf::security::InvalidKeyException::clone
() const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 1574).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**InvalidKeyException.h**

6.284 decaf::nio::InvalidMarkException Class Reference

Clones this exception.
- virtual ~**InvalidMarkException** () throw ()

6.284.1 Constructor & Destructor Documentation

6.284.1.1 decaf::nio::InvalidMarkException::InvalidMarkException () throw () [inline]

Default Constructor.

6.284.1.2 decaf::nio::InvalidMarkException::InvalidMarkException (const lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex The Exception whose state data is to be copied into this Exception.

6.284.1.3 decaf::nio::InvalidMarkException::InvalidMarkException (const InvalidMarkException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The Exception whose state data is to be copied into this Exception.

6.284.1.4 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.284.1.5 decaf::nio::InvalidMarkException::InvalidMarkException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.284.1.6 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.284.1.7 `virtual decaf::nio::InvalidMarkException::~~InvalidMarkException ()
throw () [inline, virtual]`

6.284.2 Member Function Documentation

6.284.2.1 `virtual InvalidMarkException* decaf::nio::InvalidMarkException::clone ()
const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new Exception instance that is a copy of this Exception.

Reimplemented from `decaf::lang::exceptions::IllegalStateException` (p. 1402).

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/InvalidMarkException.h`

6.285 cms::InvalidSelectorException Class Reference

6.286.1 Constructor & Destructor Documentation

6.286.1.1 decaf::lang::exceptions::InvalidStateException::InvalidStateException () throw () [inline]

Default Constructor.

6.286.1.2 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.286.1.3 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const InvalidStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.286.1.4 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.286.1.5 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.286.1.6 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.286.1.7 **virtual**
 `decaf::lang::exceptions::InvalidStateException::~~InvalidStateException ()`

Copy Constructor.

Parameters:

ex the exception to copy

6.287.1.3 `decaf::io::IOException::IOException (const IOException & ex) throw ()` [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.287.1.4 `decaf::io::IOException::IOException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.287.1.5 `decaf::io::IOException::IOException (const std::exception * cause) throw ()` [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.287.1.6 `decaf::io::IOException::IOException (const char * file, const int lineNumber, const char * msg, ...) throw ()` [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.287.1.7 `virtual decaf::io::IOException::~~IOException () throw () [inline, virtual]`

6.287.2 Member Function Documentation

6.287.2.1 `virtual IOException* decaf::io::IOException::clone () const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this instance.

Reimplemented from `decaf::lang::Exception` (p. 1271).

Reimplemented in `decaf::io::EOFException` (p. 1267), `decaf::io::InterruptedIOException` (p. 1464), `decaf::io::UTFDataFormatException` (p. 2685), `decaf::net::BindException` (p. 565), `decaf::net::ConnectException` (p. 940), `decaf::net::HttpRetryException` (p. 1392), `decaf::net::MalformedURLException` (p. 1688), `decaf::net::NoRouteToHostException` (p. 1941), `decaf::net::PortUnreachableException` (p. 2039), `decaf::net::ProtocolException` (p. 2152), `decaf::net::SocketException` (p. 2380), `decaf::net::SocketTimeoutException` (p. 2397), `decaf::net::UnknownHostException` (p. 2631), and `decaf::net::UnknownServiceException` (p. 2634).

*Has the **Transport** (p. 2608) been shutdown and no longer usable.*
- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const decaf::net::URI &uri AMQCPP_UNUSED) throw (decaf::io::IOException)
reconnect to another location

6.288.1 Detailed Description

Implementation of the **Transport** (p. 2608) interface that performs marshaling of **commands** (p. 59) to IO streams. This class does not implement the request method, it only handles oneway messages. A thread polls on the input stream for in-coming **commands** (p. 59). When a command is received, the command listener is notified. The polling thread is not started until the start method is called. The close method will close the associated streams. Close can be called explicitly by the user, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

6.288.2 Constructor & Destructor Documentation

6.288.2.1 activemq::transport::IOTransport::IOTransport ()

Default Constructor.

6.288.2.2 activemq::transport::IOTransport::IOTransport (const Pointer< wireformat::WireFormat > & wireFormat)

Create an instance of this **Transport** (p. 2608) and assign its WireFormat instance at creation time.

Parameters:

wireFormat Data encoder / decoder to use when reading and writing.

6.288.2.3 `virtual activemq::transport::IOTransport::~~IOTransport ()` [virtual]

6.288.3 Member Function Documentation

6.288.3.1 `virtual void activemq::transport::IOTransport::close () throw (cms::CMSException)` [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

CMSException if errors occur.

Implements `cms::Closeable` (p. 838).

6.288.3.2 `virtual std::string activemq::transport::IOTransport::getRemoteAddress () const` [inline, virtual]

Returns:

the remote address for this connection

Implements `activemq::transport::Transport` (p. 2609).

6.288.3.3 `virtual TransportListener* activemq::transport::IOTransport::getTransportListener () const` [inline, virtual]

Gets the observer of asynchronous `exceptions` (p. 62) from this `transport` (p. 67).

Returns:

The listener of `transport` (p. 67) events.

Implements `activemq::transport::Transport` (p. 2609).

6.288.3.4 `virtual bool activemq::transport::IOTransport::isClosed () const` [inline, virtual]

Has the `Transport` (p. 2608) been shutdown and no longer usable.

Returns:

true if the `Transport` (p. 2608)

Implements `activemq::transport::Transport` (p. 2609).

6.288.3.5 virtual bool activemq::transport::IOTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 2608) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2610).

6.288.3.6 virtual bool activemq::transport::IOTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 2608) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2610).

6.288.3.7 virtual Transport* activemq::transport::IOTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2608) to allow a higher level **transport** (p. 67) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2610).

6.288.3.8 virtual void activemq::transport::IOTransport::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2610).

6.288.3.9 virtual void activemq::transport::IOTransport::reconnect
 (const decaf::net::URI &uri *AMQCPP_UNUSED*) throw (
 decaf::io::IOException) [inline, virtual]

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

6.288.3.10 virtual Pointer<Response> activemq::transport::IOTransport::request
 (const Pointer< Command > & *command*, unsigned
 int *timeout*) throw (decaf::io::IOException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Not supported by this class - throws an exception.

Parameters:

command the command to be sent.

timeout the time to wait for a response.

Returns:

the response to the command sent.

Exceptions:

UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 2611).

6.288.3.11 virtual Pointer<Response> activemq::transport::IOTransport::request
 (const Pointer< Command > & *command*)
 throw (decaf::io::IOException, de-
 caf::lang::exceptions::UnsupportedOperationException)
 [virtual]

Not supported by this class - throws an exception.

Parameters:

command the command to be sent.

Returns:

the response to the command sent.

Exceptions:

UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 2612).

6.288.3.12 virtual void activemq::transport::IOTransport::run () [virtual]

Runs the polling thread.

Implements **decaf::lang::Runnable** (p. 2256).

6.288.3.13 virtual void activemq::transport::IOTransport::setInputStream (decaf::io::DataInputStream * *is*) [inline, virtual]

Sets the input stream for in-coming **commands** (p. 59).

Parameters:

is The input stream.

6.288.3.14 virtual void activemq::transport::IOTransport::setOutputStream (decaf::io::DataOutputStream * *os*) [inline, virtual]

Sets the output stream for out-going **commands** (p. 59).

Parameters:

os The output stream.

6.288.3.15 virtual void activemq::transport::IOTransport::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).

Parameters:

listener the listener of **transport** (p. 67) events.

Implements **activemq::transport::Transport** (p. 2612).

6.288.3.16 virtual void activemq::transport::IOTransport::setWireFormat (const Pointer< wireformat::WireFormat > & *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode **commands** (p. 59).

Implements **activemq::transport::Transport** (p. 2612).

6.288.3.17 virtual void activemq::transport::IOTransport::start () throw (cms::CMSException) [virtual]

Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59). If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

CMSException if an error occurs or if this **transport** (p. 67) has already been closed.

Implements **cms::Startable** (p. 2413).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/IOTransport.h`

6.289 decaf::lang::Iterable< E > Class Template Reference

Implementing this interface allows an object to be cast to an **Iterable** (p.1487) type for generic collections API calls.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Iterable.h`

6.290 decaf::util::Iterator< T > Class Template Reference

Defines an object that can be used to iterate over the elements of a collection.

`#include <src/main/decaf/util/Iterator.h>` Inheritance diagram for `decaf::util::Iterator< T >`:

Public Member Functions

- virtual `~Iterator ()`
- virtual `T next ()=0 throw (lang::exceptions::NoSuchElementException)`
Returns the next element in the iteration.
- virtual `bool hasNext () const =0`
Returns true if the iteration has more elements.
- virtual `void remove ()=0 throw (lang::exceptions::IllegalStateException, lang::exceptions::UnsupportedOperationException)`
Removes from the underlying collection the last element returned by the iterator (optional operation).

6.290.1 Detailed Description

`template<typename T> class decaf::util::Iterator< T >`

Defines an object that can be used to iterate over the elements of a collection. The iterator provides a way to access and remove elements with well defined semantics.

6.290.2 Constructor & Destructor Documentation

6.290.2.1 `template<typename T> virtual decaf::util::Iterator< T >::~~Iterator ()`
`[inline, virtual]`

6.290.3 Member Function Documentation

6.290.3.1 `template<typename T> virtual bool decaf::util::Iterator< T >::hasNext () const` `[pure virtual]`

Returns true if the iteration has more elements. Returns false if the next call to `next` would result in an `NoSuchElementException` to be thrown.

6.290.3.2 `template<typename T> virtual T decaf::util::Iterator< T >::next ()`
`throw (lang::exceptions::NoSuchElementException)` `[pure virtual]`

Returns the next element in the iteration. Calling this method repeatedly until the `hasNext()` (p. 1489) method returns false will return each element in the underlying collection exactly once.

Returns:

next element in the iteration of elements

Exceptions:

NoSuchElementException - iteration has no more elements.

6.290.3.3 `template<typename T> virtual void decaf::util::Iterator< T
>::remove () throw (lang::exceptions::IllegalStateException,
lang::exceptions::UnsupportedOperationException) [pure virtual]`

Removes from the underlying collection the last element returned by the iterator (optional operation). This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions:

UnsupportedOperationException - if the remove operation is not supported by this **Iterator** (p. 1489).

IllegalStateException - if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Iterator.h`

6.291 activemq::commands::JournalQueueAck Class Reference

#include <src/main/activemq/commands/JournalQueueAck.h> Inheritance diagram for activemq::commands::JournalQueueAck:

Public Member Functions

- **JournalQueueAck** ()
- virtual **~JournalQueueAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **JournalQueueAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ActiveMQDestination** > &**getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > &**getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual const **Pointer**< **MessageAck** > &**getMessageAck** () const
- virtual **Pointer**< **MessageAck** > &**getMessageAck** ()
- virtual void **setMessageAck** (const **Pointer**< **MessageAck** > &messageAck)

Static Public Attributes

- static const unsigned char **ID_JOURNALQUEUEACK** = 52

Protected Member Functions

- **JournalQueueAck** (const **JournalQueueAck** &)
- **JournalQueueAck** & **operator=** (const **JournalQueueAck** &)

Protected Attributes

- **Pointer**< **ActiveMQDestination** > **destination**
- **Pointer**< **MessageAck** > **messageAck**

6.291.1 Constructor & Destructor Documentation

- 6.291.1.1 `activemq::commands::JournalQueueAck::JournalQueueAck (const JournalQueueAck &) [inline, protected]`
- 6.291.1.2 `activemq::commands::JournalQueueAck::JournalQueueAck ()`
- 6.291.1.3 `virtual activemq::commands::JournalQueueAck::~~JournalQueueAck () [virtual]`

6.291.2 Member Function Documentation

- 6.291.2.1 `virtual JournalQueueAck* activemq::commands::JournalQueueAck::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

- 6.291.2.2 `virtual void activemq::commands::JournalQueueAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

- 6.291.2.3 `virtual bool activemq::commands::JournalQueueAck::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

- 6.291.2.4 `virtual unsigned char activemq::commands::JournalQueueAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new `DataStructure` (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p.1176).

- 6.291.2.5 **virtual** **Pointer**<**ActiveMQDestination**>& **activemq::commands::JournalQueueAck::getDestination** ()
[virtual]
- 6.291.2.6 **virtual const** **Pointer**<**ActiveMQDestination**>& **activemq::commands::JournalQueueAck::getDestination** () **const**
[virtual]
- 6.291.2.7 **virtual** **Pointer**<**MessageAck**>& **activemq::commands::JournalQueueAck::getMessageAck** ()
[virtual]
- 6.291.2.8 **virtual const** **Pointer**<**MessageAck**>& **activemq::commands::JournalQueueAck::getMessageAck** () **const**
[virtual]
- 6.291.2.9 **JournalQueueAck**& **activemq::commands::JournalQueueAck::operator=**
(**const JournalQueueAck** &) [inline, protected]
- 6.291.2.10 **virtual void** **activemq::commands::JournalQueueAck::setDestination**
(**const Pointer**< **ActiveMQDestination** > & *destination*) [virtual]
- 6.291.2.11 **virtual void** **activemq::commands::JournalQueueAck::setMessageAck**
(**const Pointer**< **MessageAck** > & *messageAck*) [virtual]
- 6.291.2.12 **virtual std::string** **activemq::commands::JournalQueueAck::toString** ()
const [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p.560).

6.291.3 Field Documentation

- 6.291.3.1 **Pointer**<**ActiveMQDestination**> **activemq::commands::JournalQueueAck::destination**
[protected]
- 6.291.3.2 **const unsigned char** **activemq::commands::JournalQueueAck::ID _-JOURNALQUEUEACK** = 52 [static]
- 6.291.3.3 **Pointer**<**MessageAck**> **activemq::commands::JournalQueueAck::messageAck**
[protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/`**JournalQueueAck.h**

6.292 activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller Class Reference

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p.1495).

#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalQueueAckMarshaller.h>Inheritance diagram for activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller:

Public Member Functions

- **JournalQueueAckMarshaller** ()
- virtual **~JournalQueueAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.292.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p.1495). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.292.2 Constructor & Destructor Documentation

6.292.2.1 `activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::JournalQueueAckMarshaller()` [inline]

6.292.2.2 `virtual activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller()` [inline, virtual]

6.292.3 Member Function Documentation

6.292.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.292.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.292.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.292.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.292.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - **BooleanStream** stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.292.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.292.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.293.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p.1499). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.293.2 Constructor & Destructor Documentation

6.293.2.1 `activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::JournalQueueAckMarshaller()` [inline]

6.293.2.2 `virtual activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller()` [inline, virtual]

6.293.3 Member Function Documentation

6.293.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.293.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.293.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.293.3.4 virtual void **activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.293.3.5 virtual int **activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.293.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.293.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.294.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p.1503). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.294.2 Constructor & Destructor Documentation

6.294.2.1 `activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::JournalQueueAckMarshaller()` [inline]

6.294.2.2 `virtual activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller()` [inline, virtual]

6.294.3 Member Function Documentation

6.294.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.294.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.294.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.294.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.294.3.5 virtual int **activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.294.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.294.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

- virtual const **Pointer**< **TransactionId** > & **getTransactionId** () const
- virtual **Pointer**< **TransactionId** > & **getTransactionId** ()
- virtual void **setTransactionId** (const **Pointer**< **TransactionId** > &transactionId)

Static Public Attributes

- static const unsigned char **ID_JOURNALTOPICACK** = 50

Protected Member Functions

- **JournalTopicAck** (const **JournalTopicAck** &)
- **JournalTopicAck** & **operator=** (const **JournalTopicAck** &)

Protected Attributes

- **Pointer**< **ActiveMQDestination** > **destination**
- **Pointer**< **MessageId** > **messageId**
- long long **messageSequenceId**
- std::string **subscriptionName**
- std::string **clientId**
- **Pointer**< **TransactionId** > **transactionId**

6.295.1 Constructor & Destructor Documentation

- 6.295.1.1** **activemq::commands::JournalTopicAck::JournalTopicAck** (const **JournalTopicAck** &) [inline, protected]
- 6.295.1.2** **activemq::commands::JournalTopicAck::JournalTopicAck** ()
- 6.295.1.3** **virtual activemq::commands::JournalTopicAck::~~JournalTopicAck** () [virtual]

6.295.2 Member Function Documentation

- 6.295.2.1** **virtual JournalTopicAck* activemq::commands::JournalTopicAck::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

- 6.295.2.2** **virtual void activemq::commands::JournalTopicAck::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.295.2.3 virtual bool activemq::commands::JournalTopicAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.295.2.4 virtual std::string& activemq::commands::JournalTopicAck::getClientId () [virtual]

6.295.2.5 virtual const std::string& activemq::commands::JournalTopicAck::getClientId () const [virtual]

6.295.2.6 virtual unsigned char activemq::commands::JournalTopicAck::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

-
- 6.295.2.7 `virtual Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination ()`
[virtual]
 - 6.295.2.8 `virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination () const`
[virtual]

6.296.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p.1512). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.296.2 Constructor & Destructor Documentation

6.296.2.1 `activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::JournalTopicAckMarshaller()` [inline]

6.296.2.2 `virtual activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller()` [inline, virtual]

6.296.3 Member Function Documentation

6.296.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.296.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.296.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.296.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.296.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.296.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.296.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.297.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p.1516). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.297.2 Constructor & Destructor Documentation

6.297.2.1 `activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::JournalTopicAckMarshaller()` [inline]

6.297.2.2 `virtual activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller()` [inline, virtual]

6.297.3 Member Function Documentation

6.297.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.297.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.297.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.297.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::looseUnmarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.297.3.5 virtual int **activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightMarshal1** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.297.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.297.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.298.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p.1520). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.298.2 Constructor & Destructor Documentation

6.298.2.1 `activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::JournalTopicAckMarshaller()` [inline]

6.298.2.2 `virtual activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller()` [inline, virtual]

6.298.3 Member Function Documentation

6.298.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.298.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.298.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.298.3.4 virtual void **activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.298.3.5 virtual int **activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - **BooleanStream** stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.298.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.298.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**JournalTopicAckMarshaller.h**

6.299 activemq::commands::JournalTrace Class Reference

#include <src/main/activemq/commands/JournalTrace.h> Inheritance diagram for activemq::commands::JournalTrace:

Public Member Functions

- **JournalTrace** ()
- virtual **~JournalTrace** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **JournalTrace * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const std::string & **getMessage** () const
- virtual std::string & **getMessage** ()
- virtual void **setMessage** (const std::string &message)

Static Public Attributes

- static const unsigned char **ID_JOURNALTRACE** = 53

Protected Member Functions

- **JournalTrace** (const **JournalTrace** &)
- **JournalTrace** & **operator=** (const **JournalTrace** &)

Protected Attributes

- std::string **message**

6.299.1 Constructor & Destructor Documentation

- 6.299.1.1 `activemq::commands::JournalTrace::JournalTrace (const JournalTrace &) [inline, protected]`
- 6.299.1.2 `activemq::commands::JournalTrace::JournalTrace ()`
- 6.299.1.3 `virtual activemq::commands::JournalTrace::~~JournalTrace () [virtual]`

6.299.2 Member Function Documentation

- 6.299.2.1 `virtual JournalTrace* activemq::commands::JournalTrace::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

- 6.299.2.2 `virtual void activemq::commands::JournalTrace::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

- 6.299.2.3 `virtual bool activemq::commands::JournalTrace::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

- 6.299.2.4 `virtual unsigned char activemq::commands::JournalTrace::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new `DataStructure` (p. 1174) type copy.

Implements `activemq::commands::DataStructure` (p. 1176).

- 6.299.2.5 `virtual std::string& activemq::commands::JournalTrace::getMessage ()`
[virtual]
- 6.299.2.6 `virtual const std::string& activemq::commands::JournalTrace::getMessage
() const` [virtual]
- 6.299.2.7 `JournalTrace& activemq::commands::JournalTrace::operator= (const
JournalTrace &)` [inline, protected]
- 6.299.2.8 `virtual void activemq::commands::JournalTrace::setMessage (const
std::string & message)` [virtual]
- 6.299.2.9 `virtual std::string activemq::commands::JournalTrace::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.560).

6.299.3 Field Documentation

- 6.299.3.1 `const unsigned char activemq::commands::JournalTrace::ID_ -
JOURNALTRACE = 53` [static]
- 6.299.3.2 `std::string activemq::commands::JournalTrace::message` [protected]

The documentation for this class was generated from the following file:

6.300 activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller Class Reference

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p. 1527).

#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalTraceMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller:

Public Member Functions

- **JournalTraceMarshaller** ()
- virtual **~JournalTraceMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.300.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p. 1527). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.300.2 Constructor & Destructor Documentation

6.300.2.1 `activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::JournalTraceMarshaller()` [inline]

6.300.2.2 `virtual activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::~~JournalTraceMarshaller()` [inline, virtual]

6.300.3 Member Function Documentation

6.300.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.300.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.300.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.300.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.300.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.300.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.300.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.301.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p. 1531). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.301.2 Constructor & Destructor Documentation

6.301.2.1 `activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::JournalTraceMarshaller()` [inline]

6.301.2.2 `virtual activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::~~JournalTraceMarshaller()` [inline, virtual]

6.301.3 Member Function Documentation

6.301.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.301.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.301.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.301.3.4 virtual void `activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.301.3.5 virtual int `activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.301.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.301.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.302.3 Member Function Documentation

6.302.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.302.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaller.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.302.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.302.3.4 virtual void `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.302.3.5 virtual int `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.302.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.302.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**JournalTraceMarshaller.h**

6.303 activemq::commands::JournalTransaction Class Reference

#include <src/main/activemq/commands/JournalTransaction.h> Inheritance diagram for activemq::commands::JournalTransaction:

Public Member Functions

- **JournalTransaction** ()
- virtual **~JournalTransaction** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **JournalTransaction * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **TransactionId** > & **getTransactionId** () const
- virtual **Pointer**< **TransactionId** > & **getTransactionId** ()
- virtual void **setTransactionId** (const **Pointer**< **TransactionId** > &transactionId)
- virtual unsigned char **getType** () const
- virtual void **setType** (unsigned char type)
- virtual bool **getWasPrepared** () const
- virtual void **setWasPrepared** (bool wasPrepared)

Static Public Attributes

- static const unsigned char **ID_JOURNALTRANSACTION** = 54

Protected Member Functions

- **JournalTransaction** (const **JournalTransaction** &)
- **JournalTransaction** & **operator=** (const **JournalTransaction** &)

Protected Attributes

- **Pointer< TransactionId > transactionId**
- unsigned char **type**
- bool **wasPrepared**

6.303.1 Constructor & Destructor Documentation

6.303.1.1 `activemq::commands::JournalTransaction::JournalTransaction (const JournalTransaction &) [inline, protected]`

6.303.1.2 `activemq::commands::JournalTransaction::JournalTransaction ()`

6.303.1.3 `virtual activemq::commands::JournalTransaction::~~JournalTransaction () [virtual]`

6.303.2 Member Function Documentation

6.303.2.1 `virtual JournalTransaction* activemq::commands::JournalTransaction::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.303.2.2 `virtual void activemq::commands::JournalTransaction::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.303.2.3 `virtual bool activemq::commands::JournalTransaction::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.303.2.4 virtual unsigned char activemq::commands::JournalTransaction::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

6.303.2.5 virtual Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () [virtual]

6.303.2.6 virtual const Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () const [virtual]

6.303.2.7 virtual unsigned char activemq::commands::JournalTransaction::getType () const [virtual]

6.303.2.8 virtual bool activemq::commands::JournalTransaction::getWasPrepared () const [virtual]

6.303.2.9 JournalTransaction& activemq::commands::JournalTransaction::operator= (const JournalTransaction &) [inline, protected]

6.303.2.10 virtual void activemq::commands::JournalTransaction::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.303.2.11 virtual void activemq::commands::JournalTransaction::setType (unsigned char *type*) [virtual]

6.303.2.12 virtual void activemq::commands::JournalTransaction::setWasPrepared (bool *wasPrepared*) [virtual]

6.303.2.13 virtual std::string activemq::commands::JournalTransaction::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 560).

6.303.3 Field Documentation

- 6.303.3.1 `const unsigned char activemq::commands::JournalTransaction::ID - JOURNALTRANSACTION = 54` [static]

Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.304.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p.1543). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.304.2 Constructor & Destructor Documentation

6.304.2.1 `activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::JournalTrans`
`() [inline]`

6.304.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::~~JournalTran`
`() [inline, virtual]`

6.304.3 Member Function Documentation

6.304.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.304.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.304.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.304.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseUnmarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.304.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.304.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.304.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.305.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p.1547). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.305.2 Constructor & Destructor Documentation

6.305.2.1 `activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::JournalTrans`
`() [inline]`

6.305.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::~~JournalTran`
`() [inline, virtual]`

6.305.3 Member Function Documentation

6.305.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.305.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.305.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.305.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::looseUnmarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.305.3.5 virtual int **activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightMarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.305.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.305.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::~~JournalTra
() [inline, virtual]`

6.306.3 Member Function Documentation

6.306.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.306.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::getDataStructu
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.306.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.306.3.4 virtual void **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::looseUnmarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.306.3.5 virtual int **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightMarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.306.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.306.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual bool **isKeepAliveInfo** () const
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID _KEEPALIVEINFO** = 10

Protected Member Functions

- **KeepAliveInfo** (const **KeepAliveInfo** &)
- **KeepAliveInfo & operator=** (const **KeepAliveInfo** &)

6.307.1 Constructor & Destructor Documentation

6.307.1.1 `activemq::commands::KeepAliveInfo::KeepAliveInfo (const KeepAliveInfo &) [inline, protected]`

6.307.1.2 `activemq::commands::KeepAliveInfo::KeepAliveInfo ()`

6.307.1.3 `virtual activemq::commands::KeepAliveInfo::~~KeepAliveInfo () [virtual]`

6.307.2 Member Function Documentation

6.307.2.1 `virtual KeepAliveInfo* activemq::commands::KeepAliveInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.307.2.2 `virtual void activemq::commands::KeepAliveInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.307.2.3 `virtual bool activemq::commands::KeepAliveInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.307.2.4 `virtual unsigned char activemq::commands::KeepAliveInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

6.307.2.5 `virtual bool activemq::commands::KeepAliveInfo::isKeepAliveInfo () const [inline, virtual]`

Returns:

an answer of true to the **isKeepAliveInfo()** (p. 1557) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 510).

6.307.2.6 `KeepAliveInfo& activemq::commands::KeepAliveInfo::operator= (const KeepAliveInfo &) [inline, protected]`

6.307.2.7 `virtual std::string activemq::commands::KeepAliveInfo::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.307.2.8 `virtual Pointer<Command> activemq::commands::KeepAliveInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.307.3 Field Documentation

6.307.3.1 `const unsigned char activemq::commands::KeepAliveInfo::ID_ - KEEPALIVEINFO = 10 [static]`

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.308.1 Detailed Description

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 1558). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.308.2 Constructor & Destructor Documentation

6.308.2.1 `activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::KeepAliveInfoMarshaller()` [inline]

6.308.2.2 `virtual activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::~KeepAliveInfoMarshaller()` [inline, virtual]

6.308.3 Member Function Documentation

6.308.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.308.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.308.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.308.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.308.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.308.3.6 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.308.3.7 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

6.309.1 Detailed Description

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 1562). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.309.2 Constructor & Destructor Documentation

6.309.2.1 `activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::KeepAliveInfoMarshaller()` [inline]

6.309.2.2 `virtual activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::~KeepAliveInfoMarshaller()` [inline, virtual]

6.309.3 Member Function Documentation

6.309.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.309.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.309.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.309.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.309.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.309.3.6 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.309.3.7 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

6.310.3 Member Function Documentation

6.310.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.310.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.310.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.310.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.310.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.310.3.6 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.310.3.7 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/KeepAliveInfoMarshaller.h

6.311 decaf::security::Key Class Reference

The **Key** (p. 1570) interface is the top-level interface for all keys.

#include <src/main/decaf/security/Key.h> Inheritance diagram for decaf::security::Key:

Public Member Functions

- virtual **~Key** ()
- virtual std::string **getAlgorithm** () const =0
Returns the standard algorithm name for this key.
- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0
Provides the key in its primary encoding format, or nothing if this key does not support encoding.
- virtual std::string **getFormat** () const =0
Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

6.311.1 Detailed Description

The **Key** (p. 1570) interface is the top-level interface for all keys. It defines the functionality shared by all key objects. All keys have three characteristics:

An Algorithm

This is the key algorithm for that key. The key algorithm is usually an encryption or asymmetric operation algorithm (such as DSA or RSA), which will work with those algorithms and with related algorithms (such as MD5 with RSA, SHA-1 with RSA, Raw DSA, etc.) The name of the algorithm of a key is obtained using the getAlgorithm method.

An Encoded Form

This is an external encoded form for the key used when a standard representation of the key is needed outside the application, as when transmitting the key to some other party. The key is encoded according to a standard format (such as X.509 SubjectPublicKeyInfo or PKCS#8), and is returned using the getEncoded method. Note: The syntax of the ASN.1 type SubjectPublicKeyInfo is defined as follows:

```
SubjectPublicKeyInfo ::= SEQUENCE {
algorithm AlgorithmIdentifier,
subjectPublicKey BIT STRING }
AlgorithmIdentifier ::= SEQUENCE {
algorithm OBJECT IDENTIFIER,
parameters ANY DEFINED BY algorithm OPTIONAL }
```

For more information, see RFC 2459: Internet X.509 Public **Key** (p. 1570) Infrastructure Certificate and CRL Profile.

A Format

This is the name of the format of the encoded key. It is returned by the `getFormat` method.

6.311.2 Constructor & Destructor Documentation

6.311.2.1 `virtual decaf::security::Key::~~Key () [inline, virtual]`

6.311.3 Member Function Documentation

6.311.3.1 `virtual std::string decaf::security::Key::getAlgorithm () const [pure virtual]`

Returns the standard algorithm name for this key. For example, "DSA" would indicate that this key is a DSA key.

Returns:

the name of the algorithm associated with this key.

6.311.3.2 `virtual void decaf::security::Key::getEncoded (std::vector< unsigned char > & output) const [pure virtual]`

Provides the key in its primary encoding format, or nothing if this key does not support encoding.

Parameters:

output Receives the encoded key, or nothing if the key does not support encoding.

6.311.3.3 `virtual std::string decaf::security::Key::getFormat () const [pure virtual]`

Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding. The primary encoding format is named in terms of the appropriate ASN.1 data format, if an ASN.1 specification for this key exists. For example, the name of the ASN.1 data format for public keys is `SubjectPublicKeyInfo`, as defined by the X.509 standard; in this case, the returned format is "X.509". Similarly, the name of the ASN.1 data format for private keys is `PrivateKeyInfo`, as defined by the PKCS #8 standard; in this case, the returned format is "PKCS#8".

Returns:

the primary encoding format of the key.

The documentation for this class was generated from the following file:

- `src/main/decaf/security/Key.h`

6.312 decaf::security::KeyException Class Reference

`#include <src/main/decaf/security/KeyException.h>` Inheritance diagram for decaf::security::KeyException:

Public Member Functions

- **KeyException** () throw ()
Default Constructor.
- **KeyException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **KeyException** (const **KeyException** &ex) throw ()
Copy Constructor.
- **KeyException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **KeyException** (const std::exception *cause) throw ()
Constructor.
- **KeyException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **KeyException** * clone () const
Clones this exception.
- virtual ~**KeyException** () throw ()

6.312.1 Constructor & Destructor Documentation

6.312.1.1 decaf::security::KeyException::KeyException () throw () [inline]

Default Constructor.

6.312.1.2 decaf::security::KeyException::KeyException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.312.1.3 decaf::security::KeyException::KeyException (const KeyException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.312.1.4 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.312.1.5 decaf::security::KeyException::KeyException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.312.1.6 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.312.1.7 `virtual decaf::security::KeyException::~~KeyException () throw ()`
[inline, virtual]

6.312.2 Member Function Documentation

6.312.2.1 `virtual KeyException* decaf::security::KeyException::clone () const`
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from `decaf::security::GeneralSecurityException` (p. 1381).

Reimplemented in `decaf::security::InvalidKeyException` (p. 1469).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/KeyException.h`

6.313 activemq::commands::LastPartialCommand Class Reference

#include <src/main/activemq/commands/LastPartialCommand.h> Inheritance diagram for activemq::commands::LastPartialCommand:

Public Member Functions

- **LastPartialCommand** ()
- virtual **~LastPartialCommand** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **LastPartialCommand * cloneDataStructure** () const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*

Static Public Attributes

- static const unsigned char **ID_LASTPARTIALCOMMAND** = 61

Protected Member Functions

- **LastPartialCommand** (const **LastPartialCommand** &)
- **LastPartialCommand** & **operator=** (const **LastPartialCommand** &)

6.313.1 Constructor & Destructor Documentation

6.313.1.1 `activemq::commands::LastPartialCommand::LastPartialCommand (const LastPartialCommand &) [inline, protected]`

6.313.1.2 `activemq::commands::LastPartialCommand::LastPartialCommand ()`

6.313.1.3 `virtual
activemq::commands::LastPartialCommand::~~LastPartialCommand ()
[virtual]`

6.313.2 Member Function Documentation

6.313.2.1 `virtual LastPartialCommand* activemq::commands::LastPartialCommand::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::PartialCommand` (p. 1996).

6.313.2.2 `virtual void activemq::commands::LastPartialCommand::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::PartialCommand` (p. 1996).

6.313.2.3 `virtual bool activemq::commands::LastPartialCommand::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::PartialCommand` (p. 1996).

6.313.2.4 `virtual unsigned char activemq::commands::LastPartialCommand::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from **activemq::commands::PartialCommand** (p. 1997).

6.313.2.5 `LastPartialCommand& activemq::commands::LastPartialCommand::operator= (const LastPartialCommand &) [inline, protected]`

Reimplemented from **activemq::commands::PartialCommand** (p. 1997).

6.313.2.6 `virtual std::string activemq::commands::LastPartialCommand::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::PartialCommand** (p. 1997).

6.313.3 Field Documentation

6.313.3.1 `const unsigned char activemq::commands::LastPartialCommand::ID_LASTPARTIALCOMMAND = 61 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/LastPartialCommand.h`

6.314 activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 1578).

Public Member Functions

- **LastPartialCommandMarshaller** ()
- virtual **~LastPartialCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.314.1 Detailed Description

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 1578).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.314.2 Constructor & Destructor Documentation

6.314.2.1 `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::LastPartialCommandMarshaller()` `[inline]`

6.314.2.2 `virtual activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::~LastPartialCommandMarshaller()` `[inline, virtual]`

6.314.3 Member Function Documentation

6.314.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2004).

6.314.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2004).

6.314.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2004).

6.314.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2005).

6.314.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2005).

6.314.3.6 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2006).

6.314.3.7 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2006).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**LastPartialCommandMarshaller.h**

6.315 activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p.1582).

Write a object instance to data output stream.

6.315.1 Detailed Description

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p.1582).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.315.2 Constructor & Destructor Documentation

6.315.2.1 `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::LastPartialCommandMarshaller()` `[inline]`

6.315.2.2 `virtual activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::~LastPartialCommandMarshaller()` `[inline, virtual]`

6.315.3 Member Function Documentation

6.315.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2008).

6.315.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2008).

6.315.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2008).

6.315.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2009).

6.315.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2009).

6.315.3.6 virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2010).

6.315.3.7 virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2010).

The documentation for this class was generated from the following file:

6.316.2.1 `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::LastPartialCommandMarshaller()` [inline]

6.316.2.2 `virtual activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::~LastPartialCommandMarshaller()` [inline, virtual]

6.316.3 Member Function Documentation

6.316.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2000).

6.316.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2000).

6.316.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2000).

6.316.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2001).

6.316.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2001).

6.316.3.6 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2002).

6.316.3.7 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2002).

The documentation for this class was generated from the following file:

6.317 std::less< decaf::lang::Pointer< T > > Struct Template Reference

An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.

`#include <src/main/decaf/lang/Pointer.h>`Inheritance diagram for `std::less< decaf::lang::Pointer< T > >`:

Public Member Functions

- `bool operator() (const decaf::lang::Pointer< T > &left, const decaf::lang::Pointer< T > &right) const`

6.317.1 Detailed Description

`template<typename T> struct std::less< decaf::lang::Pointer< T > >`

An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.

6.317.2 Member Function Documentation

6.317.2.1 `template<typename T > bool std::less< decaf::lang::Pointer< T > >::operator() (const decaf::lang::Pointer< T > & left, const decaf::lang::Pointer< T > & right) const` [inline]

References `decaf::lang::Pointer< T, REFCOUNTER >::get()`.

The documentation for this struct was generated from the following file:

- `src/main/decaf/lang/Pointer.h`

6.318 decaf::util::List< E > Class Template Reference

An ordered collection (also known as a sequence).

#include <src/main/decaf/util/List.h> Inheritance diagram for decaf::util::List< E >:

Public Member Functions

- virtual **~List** ()
- virtual **ListIterator**< E > * **listIterator** ()=0
- virtual **ListIterator**< E > * **listIterator** () const =0
- virtual **ListIterator**< E > * **listIterator** (std::size_t index)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual **ListIterator**< E > * **listIterator** (std::size_t index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual std::size_t **indexOf** (const E &value)=0 throw (decaf::lang::exceptions::NoSuchElementException)
Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.
- virtual std::size_t **lastIndexOf** (const E &value)=0 throw (decaf::lang::exceptions::NoSuchElementException)
Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.
- virtual E **get** (std::size_t index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Gets the element contained at position passed.
- virtual E **set** (std::size_t index, const E &element)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Replaces the element at the specified position in this list with the specified element.
- virtual void **add** (std::size_t index, const E &element)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)
Inserts the specified element at the specified position in this list.
- virtual bool **addAll** (std::size_t index, const **Collection**< E > &source)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)
Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
- virtual E **remove** (std::size_t index)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)
Removes the element at the specified position in this list.

6.318.1 Detailed Description

template<typename E> class decaf::util::List< E >

An ordered collection (also known as a sequence). The user of this interface has precise control over where in the list each element is inserted. The user can access elements by their integer index (position in the list), and search for elements in the list.

Unlike sets, lists typically allow duplicate elements. More formally, lists typically allow pairs of elements *e1* and *e2* such that *e1.equals(e2)*, and they typically allow multiple null elements if they allow null elements at all. It is not inconceivable that someone might wish to implement a list that prohibits duplicates, by throwing runtime exceptions when the user attempts to insert them, but we expect this usage to be rare.

6.318.2 Constructor & Destructor Documentation

6.318.2.1 **template<typename E> virtual decaf::util::List< E >::~~List ()** [inline, virtual]

6.318.3 Member Function Documentation

6.318.3.1 **template<typename E> virtual void decaf::util::List< E >::add (std::size_t *index*, const E & *element*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)** [pure virtual]

Inserts the specified element at the specified position in this list. Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in **decaf::util::StlList< E >** (p. 2421), **decaf::util::StlList< CompositeTask * >** (p. 2421), **decaf::util::StlList< URI >** (p. 2421), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 2421), **decaf::util::StlList< PrimitiveValueNode >** (p. 2421), **decaf::util::StlList< Pointer< Command > >** (p. 2421), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2421).

6.318.3.2 **template<typename E> virtual bool decaf::util::List< E >::addAll (std::size_t *index*, const Collection< E > & *source*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)** [pure virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation). Shifts the element currently at that position (if any) and any subsequent elements to

the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection
source The **Collection** (p. 871) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException - if the index is greater than size
UnsupportedOperationException - If the collection is non-modifiable.

Implemented in **decaf::util::StlList< E >** (p. 2422), **decaf::util::StlList< CompositeTask * >** (p. 2422), **decaf::util::StlList< URI >** (p. 2422), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 2422), **decaf::util::StlList< PrimitiveValueNode >** (p. 2422), **decaf::util::StlList< Pointer< Command > >** (p. 2422), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2422).

6.318.3.3 `template<typename E> virtual E decaf::util::List< E >::get (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Gets the element contained at position passed.

Parameters:

index - position to get

Returns:

value at index

Implemented in **decaf::util::StlList< E >** (p. 2424), **decaf::util::StlList< CompositeTask * >** (p. 2424), **decaf::util::StlList< URI >** (p. 2424), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 2424), **decaf::util::StlList< PrimitiveValueNode >** (p. 2424), **decaf::util::StlList< Pointer< Command > >** (p. 2424), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2424).

6.318.3.4 `template<typename E> virtual std::size_t decaf::util::List< E >::indexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NoSuchElementException if value is not in the list

Implemented in `decaf::util::StlList< E >` (p. 2424), `decaf::util::StlList< CompositeTask * >` (p. 2424), `decaf::util::StlList< URI >` (p. 2424), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2424), `decaf::util::StlList< PrimitiveValueNode >` (p. 2424), `decaf::util::StlList< Pointer< Command > >` (p. 2424), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2424).

6.318.3.5 `template<typename E> virtual size_t decaf::util::List< E >::lastIndexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index *i* such that `get(i) == value` or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NoSuchElementException if value is not in the list

Implemented in `decaf::util::StlList< E >` (p. 2425), `decaf::util::StlList< CompositeTask * >` (p. 2425), `decaf::util::StlList< URI >` (p. 2425), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2425), `decaf::util::StlList< PrimitiveValueNode >` (p. 2425), `decaf::util::StlList< Pointer< Command > >` (p. 2425), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2425).

6.318.3.6 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Implemented in `decaf::util::StlList< E >` (p. 2425), `decaf::util::StlList< CompositeTask * >` (p. 2425), `decaf::util::StlList< URI >` (p. 2425), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2425), `decaf::util::StlList< PrimitiveValueNode >` (p. 2425), `decaf::util::StlList< Pointer< Command > >` (p. 2425), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2425).

6.318.3.7 `template<typename E> virtual ListIterator<E>*`
`decaf::util::List< E >::listIterator (std::size_t index) throw (`
`decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (`index < 0 || index > size()` (p. 878))

Implemented in `decaf::util::StlList< E >` (p. 2426), `decaf::util::StlList< CompositeTask * >` (p. 2426), `decaf::util::StlList< URI >` (p. 2426), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2426), `decaf::util::StlList< PrimitiveValueNode >` (p. 2426), `decaf::util::StlList< Pointer< Command > >` (p. 2426), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2426).

6.318.3.8 `template<typename E> virtual ListIterator<E>*` `decaf::util::List< E`
`>::listIterator () const [pure virtual]`

Implemented in `decaf::util::StlList< E >` (p. 2426), `decaf::util::StlList< CompositeTask * >` (p. 2426), `decaf::util::StlList< URI >` (p. 2426), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2426), `decaf::util::StlList< PrimitiveValueNode >` (p. 2426), `decaf::util::StlList< Pointer< Command > >` (p. 2426), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2426).

6.318.3.9 `template<typename E> virtual ListIterator<E>*` `decaf::util::List< E`
`>::listIterator () [pure virtual]`

Returns:

a list iterator over the elements in this list (in proper sequence).

Implemented in `decaf::util::StlList< E >` (p. 2426), `decaf::util::StlList< CompositeTask * >` (p. 2426), `decaf::util::StlList< URI >` (p. 2426), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2426), `decaf::util::StlList< PrimitiveValueNode >` (p. 2426), `decaf::util::StlList< Pointer< Command > >` (p. 2426), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2426).

6.318.3.10 `template<typename E> virtual E decaf::util::List< E >::remove (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Removes the element at the specified position in this list. Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in `decaf::util::StlList< E >` (p. 2426), `decaf::util::StlList< CompositeTask * >` (p. 2426), `decaf::util::StlList< URI >` (p. 2426), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2426), `decaf::util::StlList< PrimitiveValueNode >` (p. 2426), `decaf::util::StlList< Pointer< Command > >` (p. 2426), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2426).

6.318.3.11 `template<typename E> virtual E decaf::util::List< E >::set (std::size_t index, const E & element) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Replaces the element at the specified position in this list with the specified element.

Parameters:

index - index of the element to replace

element - element to be stored at the specified position

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

Implemented in `decaf::util::StlList< E >` (p. 2427), `decaf::util::StlList< CompositeTask * >` (p. 2427), `decaf::util::StlList< URI >` (p. 2427), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2427), `decaf::util::StlList< PrimitiveValueNode >` (p. 2427), `decaf::util::StlList< Pointer< Command > >` (p. 2427), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2427).

6.319 decaf::util::ListIterator< E > Class Template Reference

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

```
#include <src/main/decaf/util/ListIterator.h> Inheritance diagram for
decaf::util::ListIterator< E >:
```

Public Member Functions

- virtual `~ListIterator()`
- virtual void `add` (const E &e)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)
Inserts the specified element into the list (optional operation).
- virtual void `set` (const E &e)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Replaces the last element returned by next or previous with the specified element (optional operation).
- virtual bool `hasPrevious` () const =0
Returns true if this list iterator has more elements when traversing the list in the reverse direction.
- virtual E `previous` ()=0
Returns the previous element in the list.
- virtual int `nextIndex` () const =0
Returns the index of the element that would be returned by a subsequent call to next.
- virtual int `previousIndex` () const =0
Returns the index of the element that would be returned by a subsequent call to previous.

6.319.1 Detailed Description

```
template<typename E> class decaf::util::ListIterator< E >
```

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list. Note that the `remove()` (p. 1490) and `set(Object)` methods are not defined in terms of the cursor position; they are defined to operate on the last element returned by a call to `next()` (p. 1489) or `previous()` (p. 1599).

6.319.2 Constructor & Destructor Documentation

6.319.2.1 `template<typename E > virtual decaf::util::ListIterator< E >::~~ListIterator () [inline, virtual]`

6.319.3 Member Function Documentation

6.319.3.1 `template<typename E > virtual void decaf::util::ListIterator< E >::add (const E & e) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]`

Inserts the specified element into the list (optional operation). The element is inserted immediately before the next element that would be returned by next, if any, and after the next element that would be returned by previous, if any. (If the list contains no elements, the new element becomes the sole element on the list.) The new element is inserted before the implicit cursor: a subsequent call to next would be unaffected, and a subsequent call to previous would return the new element. (This call increases by one the value that would be returned by a call to nextIndex or previousIndex.)

Parameters:

e - the element to insert.

Exceptions:

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

6.319.3.2 `template<typename E > virtual bool decaf::util::ListIterator< E >::hasPrevious () const [pure virtual]`

Returns true if this list iterator has more elements when traversing the list in the reverse direction. (In other words, returns true if previous would return an element rather than throwing an exception.)

Returns:

true if the list iterator has more elements when traversing the list in the reverse direction.

6.319.3.3 `template<typename E > virtual int decaf::util::ListIterator< E >::nextIndex () const [pure virtual]`

Returns the index of the element that would be returned by a subsequent call to next. (Returns list size if the list iterator is at the end of the list.)

Returns:

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

6.319.3.4 `template<typename E > virtual E decaf::util::ListIterator< E >::previous()` [pure virtual]

Returns the previous element in the list. This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to `next` to go back and forth. (Note that alternating calls to `next` and `previous` will return the same element repeatedly.)

Returns:

the previous element in the list.

Exceptions:

NoSuchElementException - if the iteration has no previous element.

6.319.3.5 `template<typename E > virtual int decaf::util::ListIterator< E >::previousIndex()` const [pure virtual]

Returns the index of the element that would be returned by a subsequent call to `previous`. (Returns -1 if the list iterator is at the beginning of the list.)

Returns:

the index of the element that would be returned by a subsequent call to `previous`, or -1 if list iterator is at beginning of list.

6.319.3.6 `template<typename E > virtual void decaf::util::ListIterator< E >::set (const E & e) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)` [pure virtual]

Replaces the last element returned by `next` or `previous` with the specified element (optional operation). This call can be made only if neither `ListIterator.remove` (p. 1490) nor `ListIterator.add` (p. 1598) have been called after the last call to `next` or `previous`.

Parameters:

e - the element with which to replace the last element returned by `next` or `previous`.

Exceptions:

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

IllegalStateException - if neither `next` nor `previous` have been called, or `remove` or `add` have been called after the last call to `next` or `previous`.

6.320.1 Member Typedef Documentation

- 6.320.1.1** `typedef decaf::lang::PointerComparator<LocalTransactionId>
 activemq::commands::LocalTransactionId::COMPARATOR`

Reimplemented from `activemq::commands::TransactionId` (p. 2573).

6.320.2 Constructor & Destructor Documentation

- 6.320.2.1** `activemq::commands::LocalTransactionId::LocalTransactionId ()`
- 6.320.2.2** `activemq::commands::LocalTransactionId::LocalTransactionId (const
 LocalTransactionId & other)`
- 6.320.2.3** `virtual activemq::commands::LocalTransactionId::~~LocalTransactionId ()
 [virtual]`

6.320.3 Member Function Documentation

- 6.320.3.1** `virtual LocalTransactionId* ac-
 tivemq::commands::LocalTransactionId::cloneDataStructure () const
 [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

- 6.320.3.2** `virtual int activemq::commands::LocalTransactionId::compareTo (const
 LocalTransactionId & value) const [virtual]`

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

- 6.320.3.3** `virtual void activemq::commands::LocalTransactionId::copyDataStructure
 (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

6.320.3.4 `virtual bool activemq::commands::LocalTransactionId::equals (const LocalTransactionId & value) const` [virtual]

Reimplemented from `activemq::commands::TransactionId` (p. 2574).

6.320.3.5 `virtual bool activemq::commands::LocalTransactionId::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.320.3.6 `virtual Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId ()` [virtual]

6.320.3.7 `virtual const Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId () const` [virtual]

6.320.3.8 `virtual unsigned char activemq::commands::LocalTransactionId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.320.3.9 `virtual long long activemq::commands::LocalTransactionId::getValue () const` [virtual]

6.320.3.10 `virtual bool activemq::commands::LocalTransactionId::operator< (const LocalTransactionId & value) const` [virtual]

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.320.3.11 `LocalTransactionId& activemq::commands::LocalTransactionId::operator= (const LocalTransactionId & other)`

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.320.3.12 `virtual bool activemq::commands::LocalTransactionId::operator==(const LocalTransactionId & value) const` [virtual]

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.320.3.13 `virtual void activemq::commands::LocalTransactionId::setConnectionId(const Pointer< ConnectionId > & connectionId)` [virtual]

6.320.3.14 `virtual void activemq::commands::LocalTransactionId::setValue (long long value)` [virtual]

6.320.3.15 `virtual std::string activemq::commands::LocalTransactionId::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::TransactionId` (p. 2575).

6.320.4 Field Documentation

6.320.4.1 `Pointer<ConnectionId> activemq::commands::LocalTransactionId::connectionId` [protected]

Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.321.1 Detailed Description

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p.1604). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.321.2 Constructor & Destructor Documentation

6.321.2.1 `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::LocalTransactionIdMarshaller()` [inline]

6.321.2.2 `virtual activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::~~LocalTransactionIdMarshaller()` [inline, virtual]

6.321.3 Member Function Documentation

6.321.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.321.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.321.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 2586).

6.321.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 2586).

6.321.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 2587).

6.321.3.6 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 2587).

6.321.3.7 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 2588).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**LocalTransactionIdMarshaller.h**

6.322.3 Member Function Documentation

6.322.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.322.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.322.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 2582).

6.322.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 2582).

6.322.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 2583).

6.322.3.6 virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 2583).

6.322.3.7 virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 2584).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.323.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 2578).

6.323.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 2578).

6.323.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 2579).

6.323.3.6 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 2579).

6.323.3.7 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 2580).

Indicates whether or not the object is locked.

6.324.1 Detailed Description

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

Author:

Nathan Mittler

6.324.2 Constructor & Destructor Documentation

6.324.2.1 decaf::util::concurrent::Lock::Lock (**Synchronizable** * *object*, const bool *initiallyLocked* = true) [inline]

Constructor - initializes the object member and **locks** (p. 119) the object if desired.

Parameters:

object The sync object to control

initiallyLocked If true, the object will automatically be locked.

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and lock().

6.324.2.2 virtual decaf::util::concurrent::Lock::~~Lock () [inline, virtual]

Destructor - Unlocks the object if it is locked.

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and decaf::util::concurrent::Synchronizable::unlock().

6.324.3 Member Function Documentation

6.324.3.1 bool decaf::util::concurrent::Lock::isLocked () const [inline]

Indicates whether or not the object is locked.

Returns:

true if the object is locked, otherwise false.

6.324.3.2 void decaf::util::concurrent::Lock::lock () [inline]

Locks the object.

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and decaf::util::concurrent::Synchronizable::lock().

Referenced by Lock().

6.324.3.3 void decaf::util::concurrent::Lock::unlock () [inline]

Unlocks the object.

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and decaf::util::concurrent::Synchronizable::unlock().

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Lock.h**

6.325 decaf::util::concurrent::locks::Lock Class Reference

Lock (p. 1618) implementations provide more extensive locking operations than can be obtained using synchronized statements.

```
#include <src/main/decaf/util/concurrent/locks/Lock.h>
```

Public Member Functions

- virtual **~Lock** ()
- virtual void **lock** ()=0
Acquires the lock.
- virtual void **lockInterruptibly** ()=0 throw (decaf::lang::exceptions::InterruptedException)
Acquires the lock unless the current thread is interrupted.
- virtual bool **tryLock** ()=0
Acquires the lock only if it is free at the time of invocation.
- virtual bool **tryLock** (long long time, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::InterruptedException)
Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.
- virtual void **unlock** ()=0
Releases the lock.
- virtual **Condition** * **newCondition** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
*Returns a new **Condition** (p. 932) instance that is bound to this **Lock** (p. 1618) instance.*

6.325.1 Detailed Description

Lock (p. 1618) implementations provide more extensive locking operations than can be obtained using synchronized statements. They allow more flexible structuring, may have quite different properties, and may support multiple associated **Condition** (p. 932) objects.

A lock is a tool for controlling access to a shared resource by multiple threads. Commonly, a lock provides exclusive access to a shared resource: only one thread at a time can acquire the lock and all access to the shared resource requires that the lock be acquired first. However, some **locks** (p. 119) may allow **concurrent** (p. 116) access to a shared resource, such as the read lock of a **ReadWriteLock** (p. 2170).

While the scoping mechanism for synchronized statements makes it much easier to program with monitor **locks** (p. 119), and helps avoid many common programming errors involving **locks** (p. 119), there are occasions where you need to work with **locks** (p. 119) in a more flexible way. For example, some algorithms for traversing concurrently accessed data structures require the use of "hand-over-hand" or "chain locking": you acquire the lock of node A, then node B, then release A and acquire C, then release B and acquire D and so on. Implementations of the **Lock**

(p. 1618) interface enable the use of such techniques by allowing a lock to be acquired and released in different scopes, and allowing multiple **locks** (p. 119) to be acquired and released in any order.

With this increased flexibility comes additional responsibility. The absence of block-structured locking removes the automatic release of **locks** (p. 119) that occurs with synchronized statements. In most cases, the following idiom should be used:

```
Lock (p. 1618) l = ...; l.lock(); try { // access the resource protected by this lock } catch(...) { l.unlock(); }
```

When locking and unlocking occur in different scopes, care must be taken to ensure that all code that is executed while the lock is held is protected by try-catch ensure that the lock is released when necessary.

Lock (p. 1618) implementations provide additional functionality over the use of synchronized methods and statements by providing a non-blocking attempt to acquire a lock (**tryLock()** (p. 1621)), an attempt to acquire the lock that can be interrupted (**lockInterruptibly()** (p. 1620), and an attempt to acquire the lock that can timeout (**tryLock(long, TimeUnit)**).

Note that **Lock** (p. 1618) instances are just normal objects and can themselves be used as the target in a synchronized statement.

The three forms of lock acquisition (interruptible, non-interruptible, and timed) may differ in their performance characteristics, ordering guarantees, or other implementation qualities. Further, the ability to interrupt the ongoing acquisition of a lock may not be available in a given **Lock** (p. 1618) class. Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of lock acquisition, nor is it required to support interruption of an ongoing lock acquisition. An implementation is required to clearly document the semantics and guarantees provided by each of the locking methods. It must also obey the interruption semantics as defined in this interface, to the extent that interruption of lock acquisition is supported: which is either totally, or only on method entry.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since:

1.0

6.325.2 Constructor & Destructor Documentation

6.325.2.1 `virtual decaf::util::concurrent::locks::Lock::~~Lock () [inline, virtual]`

6.325.3 Member Function Documentation

6.325.3.1 `virtual void decaf::util::concurrent::locks::Lock::lock () [pure virtual]`

Acquires the lock. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired.

Implementation Considerations

A **Lock** (p. 1618) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1618) implementation.

6.325.3.2 **virtual void decaf::util::concurrent::locks::Lock::lockInterruptibly ()** **throw (decaf::lang::exceptions::InterruptedException)** [pure virtual]

Acquires the lock unless the current thread is interrupted. Acquires the lock if it is available and returns immediately.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread, and interruption of lock acquisition is supported.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return.

A **Lock** (p.1618) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p.1618) implementation.

Exceptions:

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

6.325.3.3 **virtual Condition* decaf::util::concurrent::locks::Lock::newCondition ()** **throw (decaf::lang::exceptions::UnsupportedOperationException)** [pure virtual]

Returns a new **Condition** (p.932) instance that is bound to this **Lock** (p.1618) instance. Before waiting on the condition the lock must be held by the current thread. A call to **Condition.await()** (p.934) will atomically release the lock before waiting and re-acquire the lock before the wait returns.

Implementation Considerations

The exact operation of the **Condition** (p.932) instance depends on the **Lock** (p.1618) implementation and must be documented by that implementation.

Returns:

A new **Condition** (p.932) instance for this **Lock** (p.1618) instance the caller must delete the returned **Condition** (p.932) object when done with it.

Exceptions:

UnsupportedOperationException if this **Lock** (p.1618) implementation does not support conditions

6.325.3.4 virtual bool decaf::util::concurrent::locks::Lock::tryLock (long long *time*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::InterruptedException) [pure virtual]

Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted. If the lock is available this method returns immediately with the value true. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * The lock is acquired by the current thread; or
- * Some other thread interrupts the current thread, and interruption of lock acquisition is supported; or
- * The specified waiting time elapses

If the lock is acquired then the value true is returned.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return, or reporting a timeout.

A **Lock** (p.1618) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p.1618) implementation.

Parameters:

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns:

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions:

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

6.325.3.5 virtual bool decaf::util::concurrent::locks::Lock::tryLock () [pure virtual]

Acquires the lock only if it is free at the time of invocation. Acquires the lock if it is available and returns immediately with the value true. If the lock is not available then this method will return immediately with the value false.

A typical usage idiom for this method would be:

```
Lock (p. 1618) lock = ...; if (lock.tryLock()) { try { // manipulate protected state } catch(...) {  
lock.unlock(); } } else { // perform alternative actions }
```

This usage ensures that the lock is unlocked if it was acquired, and doesn't try to unlock if the lock was not acquired.

Returns:

true if the lock was acquired and false otherwise

6.325.3.6 virtual void decaf::util::concurrent::locks::Lock::unlock () [pure virtual]

Releases the lock. Implementation Considerations

A **Lock** (p. 1618) implementation will usually impose restrictions on which thread can release a lock (typically only the holder of the lock can release it) and may throw an exception if the restriction is violated. Any restrictions and the exception type must be documented by that **Lock** (p. 1618) implementation.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/locks/**Lock.h**

6.326 decaf::util::logging::Logger Class Reference

```
#include <src/main/decaf/util/logging/Logger.h>
```

Public Member Functions

- **Logger** (const std::string &name, **Logger** *parent)
*Creates a new instance of the **Logger** (p. 1623) with the given name and assign it the given parent logger.*
- virtual ~**Logger** ()
- virtual const std::string & **getName** () const
*Gets the name of this **Logger** (p. 1623).*
- virtual void **addHandler** (**Handler** *handler) throw (lang::exceptions::IllegalArgumentException)
*Add a log **Handler** (p. 1382) to receive **logging** (p. 120) messages.*
- virtual void **removeHandler** (**Handler** *handler)
*Removes the specified **Handler** (p. 1382) and destroys it.*
- virtual void **setFilter** (**Filter** *filter)
Gets a vector containing all the handlers that this class has been assigned to use.
- virtual const **Filter** * **getFilter** () const
*Gets the **Filter** (p. 1314) object that this class is using.*
- virtual **Level** **getLevel** () const
*Get the log Level that has been specified for this **Logger** (p. 1623).*
- virtual void **setLevel** (**Level** level)
***Set** (p. 2320) the log level specifying which message levels will be logged by this logger.*
- virtual bool **getUseParentHandlers** () const
Discover whether or not this logger is sending its output to its parent logger.
- virtual void **setUseParentHandlers** (bool value)
*pecify whether or not this logger should send its output to it's parent **Logger** (p. 1623).*
- virtual void **entry** (const std::string &blockName, const std::string &file, const int line)
Logs an Block Enter message.
- virtual void **exit** (const std::string &blockName, const std::string &file, const int line)
Logs an Block Exit message.
- virtual void **debug** (const std::string &file, const int line, const std::string functionName, const std::string &message)
Log a Debug Level Log.

- virtual void **info** (const std::string &file, const int line, const std::string functionName, const std::string &message)
Log a info Level Log.
- virtual void **warn** (const std::string &file, const int line, const std::string functionName, const std::string &message)
Log a warn Level Log.
- virtual void **error** (const std::string &file, const int line, const std::string functionName, const std::string &message)
Log a error Level Log.
- virtual void **fatal** (const std::string &file, const int line, const std::string functionName, const std::string &message)
Log a fatal Level Log.
- virtual bool **isLoggable** (**Level** level) const
Log a Throw Message.
- virtual void **log** (**LogRecord** &record)
*Log a **LogRecord** (p. 1645).*
- virtual void **log** (**Level** level, const std::string &message)
Log a message, with no arguments.
- virtual void **log** (**Level** level, const std::string &file, const int line, const std::string &message,...)
Log a message, with the list of params that is formatted into the message string.
- virtual void **log** (**Level** level, const std::string &file, const int line, const std::string &message, **lang::Exception** &ex)
Log a message, with associated Throwable information.

Static Public Member Functions

- static **Logger** * **getAnonymousLogger** ()
Creates an anonymous logger.
- static **Logger** * **getLogger** (const std::string &name)
Find or create a logger for a named subsystem.

6.326.1 Constructor & Destructor Documentation

6.326.1.1 decaf::util::logging::Logger::Logger (const std::string & name, Logger * parent)

Creates a new instance of the **Logger** (p. 1623) with the given name and assign it the given parent logger. The logger will be initially configured with a null Level and with useParentHandlers true.

Parameters:

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as java.net or javax.swing. It may be null for anonymous Loggers.

parent logger that is this one's parent

6.326.1.2 virtual decaf::util::logging::Logger::~~Logger () [virtual]**6.326.2 Member Function Documentation****6.326.2.1 virtual void decaf::util::logging::Logger::addHandler (Handler * *handler*) throw (lang::exceptions::IllegalArgumentException) [virtual]**

Add a log **Handler** (p.1382) to receive **logging** (p.120) messages. By default, Loggers also send their output to their parent logger. Typically the root **Logger** (p.1623) is configured with a set of Handlers that essentially act as default handlers for all loggers.

Parameters:

handler A Logging **Handler** (p.1382)

Exceptions:

IllegalArgumentException

6.326.2.2 virtual void decaf::util::logging::Logger::debug (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a Debug Level Log. If the logger is currently enabled for the DEBUG message level then the given message is forwarded to all the registered output **Handler** (p.1382) objects.

Parameters:

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log

6.326.2.3 virtual void decaf::util::logging::Logger::entry (const std::string & *blockName*, const std::string & *file*, const int *line*) [virtual]

Logs an Block Enter message. This is a convenience method that is used to tag a block enter, a log record with the class name function name and the string Entering is logged at the DEBUG log level.

Parameters:

blockName source block name

file source file name

line source line name

6.326.2.4 `virtual void decaf::util::logging::Logger::error (const std::string & file,
const int line, const std::string functionName, const std::string &
message)` [virtual]

Log a error Level Log. If the logger is currently enabled for the error message level then the given message is forwarded to all the registered output **Handler** (p.1382) objects.

Parameters:

file the file name where the log was generated
line the line number where the log was generated
functionName name of the function that logged this
message the message to log

6.326.2.5 `virtual void decaf::util::logging::Logger::exit (const std::string &
blockName, const std::string & file, const int line)` [virtual]

Logs an Block Exit message. This is a convenience method that is used to tag a block exit, a log record with the class name function name and the string Exiting is logged at the DEBUG log level.

Parameters:

blockName source block name
file source file name
line source line name

6.326.2.6 `virtual void decaf::util::logging::Logger::fatal (const std::string & file,
const int line, const std::string functionName, const std::string &
message)` [virtual]

Log a fatal Level Log. If the logger is currently enabled for the fatal message level then the given message is forwarded to all the registered output **Handler** (p.1382) objects.

Parameters:

file the file name where the log was generated
line the line number where the log was generated
functionName name of the function that logged this
message the message to log

6.326.2.7 `static Logger* decaf::util::logging::Logger::getAnonymousLogger ()`
[static]

Creates an anonymous logger. The newly created **Logger** (p.1623) is not registered in the **Log-Manager** (p.1640) namespace. There will be no access checks on updates to the logger. Even although the new logger is anonymous, it is configured to have the root logger ("") as its parent. This means that by default it inherits its effective level and handlers from the root logger.

The caller is responsible for destroying the returned logger.

Returns:

Newly created anonymous logger

6.326.2.8 virtual const Filter* decaf::util::logging::Logger::getFilter () const
[inline, virtual]

Gets the **Filter** (p. 1314) object that this class is using.

Returns:

the **Filter** (p. 1314) in use, can be null

6.326.2.9 virtual Level decaf::util::logging::Logger::getLevel () const [inline, virtual]

Get the log Level that has been specified for this **Logger** (p. 1623). The result may be the Null level, which means that this logger's effective level will be inherited from its parent.

Returns:

the level that is currently set

6.326.2.10 static Logger* decaf::util::logging::Logger::getLogger (const std::string & name) [static]

Find or create a logger for a named subsystem. If a logger has already been created with the given name it is returned. Otherwise a new logger is created.

If a new logger is created its log level will be configured based on the **LogManager** (p. 1640) and it will be configured to also send **logging** (p. 120) output to its parent loggers Handlers. It will be registered in the **LogManager** (p. 1640) global namespace.

Parameters:

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as **cms** (p. 91) or **activemq.core.ActiveMQConnection** (p. 190)

Returns:

a suitable logger.

6.326.2.11 virtual const std::string& decaf::util::logging::Logger::getName () const
[inline, virtual]

Gets the name of this **Logger** (p. 1623).

Returns:

logger name

6.326.2.12 `virtual bool decaf::util::logging::Logger::getUseParentHandlers () const`
`[inline, virtual]`

Discover whether or not this logger is sending its output to its parent logger.

Returns:

true if using Parent Handlers

6.326.2.13 `virtual void decaf::util::logging::Logger::info (const std::string & file,
const int line, const std::string functionName, const std::string &
message) [virtual]`

Log a info Level Log. If the logger is currently enabled for the info message level then the given message is forwarded to all the registered output **Handler** (p.1382) objects.

Parameters:

file the file name where the log was generated
line the line number where the log was generated
functionName name of the function that logged this
message the message to log

6.326.2.14 `virtual bool decaf::util::logging::Logger::isLoggable (Level level) const`
`[virtual]`

Log a Throw Message. If the logger is currently enabled for the Throwing message level then the given message is forwarded to all the registered output **Handler** (p.1382) objects.

Parameters:

file the file name where the log was generated
line the line number where the log was generated
functionName name of the function that logged this
message the message to log `virtual void throwing(const std::string& file, const int line,
const std::string functionName, const std::string& message);` Check if a message of the
given level would actually be logged by this logger. This check is based on the Loggers
effective level, which may be inherited from its parent.
level - a message **logging** (p.120) level

Returns:

true if the given message level is currently being logged.

6.326.2.15 `virtual void decaf::util::logging::Logger::log (Level level, const
std::string & file, const int line, const std::string & message,
lang::Exception & ex) [virtual]`

Log a message, with associated Throwable information. If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p.1645) which is

forwarded to all registered output handlers. Note that the thrown argument is stored in the **LogRecord** (p. 1645) thrown property, rather than the **LogRecord** (p. 1645) parameters property. Thus is it processed specially by output Formatters and is not treated as a formatting parameter to the **LogRecord** (p. 1645) message property.

Parameters:

level the Level to log at.
file File that the message was logged in.
line the line number where the message was logged at.
message the message to log.
ex the Exception to log

6.326.2.16 `virtual void decaf::util::logging::Logger::log (Level level, const std::string & file, const int line, const std::string & message, ...)`
[virtual]

Log a message, with the list of params that is formatted into the message string. If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1382) objects

Parameters:

level the Level to log at
file the message to log
line the line in the file
... variable length argument to format the message string.

6.326.2.17 `virtual void decaf::util::logging::Logger::log (Level level, const std::string & message)` [virtual]

Log a message, with no arguments. If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1382) objects

Parameters:

level the Level to log at
message the message to log

6.326.2.18 `virtual void decaf::util::logging::Logger::log (LogRecord & record)`
[virtual]

Log a **LogRecord** (p. 1645). All the other **logging** (p. 120) methods in this class call through this method to actually perform any **logging** (p. 120). Subclasses can override this single method to capture all log activity.

Parameters:

record - the **LogRecord** (p. 1645) to be published

6.326.2.19 `virtual void decaf::util::logging::Logger::removeHandler (Handler * handler)` [virtual]

Removes the specified **Handler** (p. 1382) and destroys it. Returns silently if the given **Handler** (p. 1382) is not found.

Parameters:

handler The **Handler** (p. 1382) to remove

6.326.2.20 `virtual void decaf::util::logging::Logger::setFilter (Filter * filter)` [virtual]

Gets a vector containing all the handlers that this class has been assigned to use.

Returns:

a list of handlers that are used by this logger **Set** (p. 2320) a filter to control output on this **Logger** (p. 1623).

After passing the initial "level" check, the **Logger** (p. 1623) will call this **Filter** (p. 1314) to check if a log record should really be published.

The caller releases ownership of this filter to this logger

Parameters:

filter to use, can be null

6.326.2.21 `virtual void decaf::util::logging::Logger::setLevel (Level level)` [inline, virtual]

Set (p. 2320) the log level specifying which message levels will be logged by this logger. Message levels lower than this value will be discarded. The level value Level.OFF can be used to turn off **logging** (p. 120).

If the new level is the Null Level, it means that this node should inherit its level from its nearest ancestor with a specific (non-null) level value.

Parameters:

level new Level value

6.326.2.22 `virtual void decaf::util::logging::Logger::setUseParentHandlers (bool value)` [inline, virtual]

pecify whether or not this logger should send its output to it's parent **Logger** (p. 1623). This means that any LogRecords will also be written to the parent's Handlers, and potentially to its parent, recursively up the namespace.

Parameters:

value True is output is to be written to the parent

6.326.2.23 `virtual void decaf::util::logging::Logger::warn (const std::string & file,
const int line, const std::string functionName, const std::string &
message)` [virtual]

Log a warn Level Log. If the logger is currently enabled for the warn message level then the given message is forwarded to all the registered output **Handler** (p. 1382) objects.

Parameters:

file the file name where the log was generated
line the line number where the log was generated
functionName name of the function that logged this
message the message to log

#include <src/main/activemq/io/LoggingInputStream.h> Inheritance diagram for activemq::io::LoggingInputStream:

Public Member Functions

- **LoggingInputStream** (decaf::io::InputStream *inputStream, bool own=false)
Creates a DataInputStream that uses the specified underlying InputStream.
- virtual ~**LoggingInputStream** ()
- virtual unsigned char **read** () throw (decaf::io::IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.

6.328.1 Constructor & Destructor Documentation

6.328.1.1 activemq::io::LoggingInputStream::LoggingInputStream (decaf::io::InputStream * inputStream, bool own = false)

Creates a DataInputStream that uses the specified underlying InputStream.

Parameters:

inputStream the InputStream instance to wrap.
own indicates if this class owns the wrapped string defaults to false.

6.328.1.2 virtual activemq::io::LoggingInputStream::~~LoggingInputStream () [virtual]

6.328.2 Member Function Documentation

6.328.2.1 virtual int activemq::io::LoggingInputStream::read (unsigned char * buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException) [virtual]

Reads an array of bytes from the buffer. Blocks until the requested number of bytes are available.

Parameters:

buffer (out) the target buffer.
offset the position in the buffer to start at
bufferSize the size of the output buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException thrown if an error occurs.

NullPointerException if buffer is null

Reimplemented from **decaf::io::FilterInputStream** (p.1319).

6.328.2.2 **virtual unsigned char activemq::io::LoggingInputStream::read () throw (decaf::io::IOException)** [virtual]

Reads a single byte from the buffer. Blocks until data is available.

Returns:

The next byte.

Exceptions:

IOException thrown if an error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p.1319).

The documentation for this class was generated from the following file:

- `src/main/activemq/io/LoggingInputStream.h`

6.329 activemq::io::LoggingOutputStream Class Reference

OutputStream filter that just logs the data being written.

#include <src/main/activemq/io/LoggingOutputStream.h> Inheritance diagram for activemq::io::LoggingOutputStream:

Public Member Functions

- **LoggingOutputStream** (OutputStream *next, bool own=false)
Constructor.
- virtual ~**LoggingOutputStream** ()
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.

6.329.1 Detailed Description

OutputStream filter that just logs the data being written.

6.329.2 Constructor & Destructor Documentation

6.329.2.1 activemq::io::LoggingOutputStream::LoggingOutputStream (OutputStream * next, bool own = false)

Constructor.

Parameters:

- next* The OutputStream to wrap an write logs to.
- own* If true, this object will control the lifetime of the output stream that it encapsulates.

6.329.2.2 virtual activemq::io::LoggingOutputStream::~~LoggingOutputStream () [virtual]

6.329.3 Member Function Documentation

6.329.3.1 virtual void activemq::io::LoggingOutputStream::write (const unsigned char * buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.
offset the position in the buffer to start at
len The number of bytes from the buffer to be written.

Exceptions:

IOException thrown if an error occurs.
NullPointerException if buffer is null.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1326).

6.329.3.2 `virtual void activemq::io::LoggingOutputStream::write (unsigned char c)
throw (decaf::io::IOException) [virtual]`

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1327).

The documentation for this class was generated from the following file:

- `src/main/activemq/io/LoggingOutputStream.h`

6.330 activemq::transport::logging::LoggingTransport Class Reference

A **transport** (p. 67) filter that logs **commands** (p. 59) as they are sent/received.

#include <src/main/activemq/transport/logging/LoggingTransport.h> Inheritance diagram for activemq::transport::logging::LoggingTransport:

Public Member Functions

- **LoggingTransport** (const **Pointer**< **Transport** > &next)

Constructor.

- virtual ~**LoggingTransport** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)

Event handler for the receipt of a command.

- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Sends a one-way command.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Not supported by this class - throws an exception.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Not supported by this class - throws an exception.

6.330.1 Detailed Description

A **transport** (p. 67) filter that logs **commands** (p. 59) as they are sent/received.

6.330.2 Constructor & Destructor Documentation

6.330.2.1 activemq::transport::logging::LoggingTransport::LoggingTransport (const **Pointer**< **Transport** > & next)

Constructor.

Parameters:

next - the next **Transport** (p. 2608) in the chain

6.330.2.2 `virtual`
`activemq::transport::logging::LoggingTransport::~~LoggingTransport ()`
`[inline, virtual]`

6.330.3 Member Function Documentation

6.330.3.1 `virtual void activemq::transport::logging::LoggingTransport::onCommand`
`(const Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Reimplemented from `activemq::transport::TransportFilter` (p. 2620).

6.330.3.2 `virtual void activemq::transport::logging::LoggingTransport::oneway`
`(const Pointer< Command > & command) throw (decaf::io::IOException,`
`decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this `transport` (p. 67).

Reimplemented from `activemq::transport::TransportFilter` (p. 2620).

6.330.3.3 `virtual Pointer<Response> ac-`
`tivemq::transport::logging::LoggingTransport::request`
`(const Pointer< Command > & command, un-`
`signed int timeout) throw (decaf::io::IOException,`
`decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters:

command the command that is sent as a request

timeout the time to wait for a response.

Exceptions:

UnsupportedOperationException.

Reimplemented from `activemq::transport::TransportFilter` (p. 2621).

6.330.3.4 virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Not supported by this class - throws an exception.

Parameters:

command the command that is sent as a request

Exceptions:

UnsupportedOperationException.

Reimplemented from **activemq::transport::TransportFilter** (p. 2622).

The documentation for this class was generated from the following file:

Assignment operator.

6.331.1 Detailed Description

There is a single global **LogManager** (p.1640) object that is used to maintain a set of shared state about Loggers and log services. This **LogManager** (p.1640) object:

* Manages a hierarchical namespace of **Logger** (p.1623) objects. All named Loggers are stored in this namespace. * Manages a set of **logging** (p.120) control properties. These are simple key-value pairs that can be used by Handlers and other **logging** (p.120) objects to configure themselves.

The global **LogManager** (p.1640) object can be retrieved using `LogManager.getLogManager()`. The **LogManager** (p.1640) object is created during class initialization and cannot subsequently be changed.

TODO By default, the **LogManager** (p.1640) reads its initial configuration from a properties file "lib/logging.properties" in the JRE directory. If you edit that property file you can change the default **logging** (p.120) configuration for all uses of that JRE.

In addition, the **LogManager** (p.1640) uses two optional system properties that allow more control over reading the initial configuration:

* "decaf.logger.config.class" * "decaf.logger.config.file"

These two properties may be set via the Preferences API, or as command line property definitions to the "java" command, or as system property definitions passed to `JNI_CreateJavaVM`.

If the "java.util.logging.config.class" property is set, then the property value is treated as a class name. The given class will be loaded, an object will be instantiated, and that object's constructor is responsible for reading in the initial configuration. (That object may use other system properties to control its configuration.) The alternate configuration class can use `readConfiguration(InputStream)` to define properties in the **LogManager** (p.1640).

If "java.util.logging.config.class" property is not set, then the "java.util.logging.config.file" system property can be used to specify a properties file (in `java.util.Properties` format). The initial **logging** (p.120) configuration will be read from this file.

If neither of these properties is defined then, as described above, the **LogManager** (p.1640) will read its initial configuration from a properties file "lib/logging.properties" in the JRE directory.

The properties for loggers and Handlers will have names starting with the dot-separated name for the handler or logger. ***TODO***

The global **logging** (p.120) properties may include:

* A property "handlers". This defines a whitespace separated list of class names for handler classes to load and register as handlers on the root **Logger** (p.1623) (the **Logger** (p.1623) named ""). Each class name must be for a **Handler** (p.1382) class which has a default constructor. Note that

these Handlers may be created lazily, when they are first used. * A property "<logger>.handlers". This defines a whitespace or comma separated list of class names for handlers classes to load and register as handlers to the specified logger. Each class name must be for a **Handler** (p. 1382) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.useParentHandlers". This defines a boolean value. By default every logger calls its parent in addition to handling the **logging** (p. 120) message itself, this often result in messages being handled by the root logger as well. When setting this property to false a **Handler** (p. 1382) needs to be configured for this logger otherwise no **logging** (p. 120) messages are delivered. * A property "config". This property is intended to allow arbitrary configuration code to be run. The property defines a whitespace separated list of class names. A new instance will be created for each named class. The default constructor of each class may execute arbitrary code to update the **logging** (p. 120) configuration, such as setting logger levels, adding handlers, adding filters, etc.

Loggers are organized into a naming hierarchy based on their dot separated names. Thus "a.b.c" is a child of "a.b", but "a.b1" and a.b2 are peers.

All properties whose names end with ".level" are assumed to define log levels for Loggers. Thus "foo.level" defines a log level for the logger called "foo" and (recursively) for any of its children in the naming hierarchy. Log Levels are applied in the order they are defined in the properties file. Thus level settings for child nodes in the tree should come after settings for their parents. The property name ".level" can be used to set the level for the root of the tree.

All methods on the **LogManager** (p. 1640) object are multi-thread safe.

6.331.2 Constructor & Destructor Documentation

6.331.2.1 `virtual decaf::util::logging::LogManager::~LogManager ()` [virtual]

6.331.2.2 `decaf::util::logging::LogManager::LogManager ()` [inline, protected]

Constructor, hidden to protect against direct instantiation.

6.331.2.3 `decaf::util::logging::LogManager::LogManager (const LogManager & manager)` [protected]

Copy Constructo.

Parameters:

manager the Manager to copy

6.331.3 Member Function Documentation

6.331.3.1 `virtual void decaf::util::logging::LogManager::addPropertyChangeListener (PropertyChangeListener * listener)` [virtual]

Adds a change listener for **LogManager** (p. 1640) **Properties** (p. 2140), adding the same instance of a change event listener does nothing.

Parameters:

listener a PropertyChangeListener

6.331.3.2 static void decaf::util::logging::LogManager::destroy () [static]

Forcefully Delete the Instance of this **LogManager** (p. 1640) even if there are outstanding references.

6.331.3.3 static LogManager* decaf::util::logging::LogManager::getInstance () [static]

Get the singleton instance.

Returns:

Pointer to an instance of the Log Manager

6.331.3.4 virtual Logger* decaf::util::logging::LogManager::getLogger (const std::string & name) [virtual]

Retrieves or creates a new **Logger** (p.1623) using the name specified a new logger inherits the configuration of the logger's parent if there is no configuration data for the logger.

Parameters:

name The name of the **Logger** (p. 1623).

6.331.3.5 virtual int decaf::util::logging::LogManager::getLoggerNames (const std::vector< std::string > & names) [virtual]

Gets a list of known **Logger** (p. 1623) Names from this Manager.

Parameters:

names STL Vector to hold string logger names

Returns:

names count of how many loggers were inserted

6.331.3.6 virtual const util::Properties& decaf::util::logging::LogManager::getProperties () const [inline, virtual]

Gets a reference to the Logging **Properties** (p. 2140) used by this logger.

Returns:

The **Logger** (p. 1623) **Properties** (p. 2140) Pointer

6.331.3.7 virtual std::string decaf::util::logging::LogManager::getProperty (const std::string & name) [inline, virtual]

Gets the value of a named property of this **LogManager** (p. 1640).

Parameters:

name of the Property to retrieve

Returns:

the value of the property

References decaf::util::Properties::getProperty().

6.331.3.8 `void decaf::util::logging::LogManager::operator= (const LogManager & manager)` [protected]

Assignment operator.

Parameters:

manager the manager to assign from

6.331.3.9 `virtual void decaf::util::logging::LogManager::removePropertyChangeListener (PropertyChangeListener * listener)` [virtual]

Removes a properties change listener from the **LogManager** (p. 1640).

Parameters:

listener a PropertyChangeListener

6.331.3.10 `static void decaf::util::logging::LogManager::returnInstance ()` [static]

Returns a Checked out instance of this Manager.

6.331.3.11 `virtual void decaf::util::logging::LogManager::setProperties (const util::Properties & properties)` [virtual]

Sets the **Properties** (p. 2140) this **LogManager** (p. 1640) should use to configure its loggers. Once set a properties change event is fired.

Parameters:

properties Pointer to read the configuration from

6.332 decaf::util::logging::LogRecord Class Reference

```
#include <src/main/decaf/util/logging/LogRecord.h>
```

Public Member Functions

- **LogRecord** ()
- virtual **~LogRecord** ()
- **Level** **getLevel** () const
Get Level of this log record.
- void **setLevel** (**Level** value)
Set (p. 2320) the Level of this Log Record.
- const std::string & **getLoggerName** () const
Gets the Source Logger's Name.
- void **setLoggerName** (const std::string &loggerName)
Sets the Source Logger's Name.
- const std::string & **getSourceFile** () const
Gets the Source Log File name.
- void **setSourceFile** (const std::string &sourceFile)
Sets the Source Log File Name.
- unsigned long **getSourceLine** () const
Gets the Source Log line number.
- void **setSourceLine** (long sourceLine)
Sets the Source Log line number.
- const std::string & **getMessage** () const
Gets the Message to be Logged.
- void **setMessage** (const std::string &message)
Sets the Message to be Logged.
- const std::string & **getSourceFunction** () const
Gets the name of the function where this log was logged.
- void **setSourceFunction** (const std::string &functionName)
Sets the name of the function where this log was logged.
- unsigned long **getTimestamp** () const
Gets the time in mills that this message was logged.
- void **setTimestamp** (long timeStamp)
Sets the time in mills that this message was logged.

- unsigned long **getTreadId** () const
Gets the Thread Id where this Log was created.
- void **setTreadId** (long threadId)
Sets the Thread Id where this Log was created.

6.332.1 Constructor & Destructor Documentation

6.332.1.1 `decaf::util::logging::LogRecord::LogRecord ()` [inline]

6.332.1.2 `virtual decaf::util::logging::LogRecord::~~LogRecord ()` [inline, virtual]

6.332.2 Member Function Documentation

6.332.2.1 `Level decaf::util::logging::LogRecord::getLevel () const` [inline]

Get Level of this log record.

Returns:

Level enumeration value.

6.332.2.2 `const std::string& decaf::util::logging::LogRecord::getLoggerName () const` [inline]

Gets the Source Logger's Name.

Returns:

the source loggers name

6.332.2.3 `const std::string& decaf::util::logging::LogRecord::getMessage () const` [inline]

Gets the Message to be Logged.

Returns:

the source logger's message

Referenced by `decaf::util::logging::SimpleFormatter::formatMessage()`.

6.332.2.4 `const std::string& decaf::util::logging::LogRecord::getSourceFile () const` [inline]

Gets the Source Log File name.

Returns:

the source loggers name

6.332.2.5 `const std::string& decaf::util::logging::LogRecord::getSourceFunction () const [inline]`

Gets the name of the function where this log was logged.

Returns:

the source logger's message

6.332.2.6 `unsigned long decaf::util::logging::LogRecord::getSourceLine () const [inline]`

Gets the Source Log line number.

Returns:

the source loggers line number

6.332.2.7 `unsigned long decaf::util::logging::LogRecord::getTimestamp () const [inline]`

Gets the time in mills that this message was logged.

Returns:

UTC time in milliseconds

6.332.2.8 `unsigned long decaf::util::logging::LogRecord::getTreadId () const [inline]`

Gets the Thread Id where this Log was created.

Returns:

the source loggers line number

6.332.2.9 `void decaf::util::logging::LogRecord::setLevel (Level value) [inline]`

Set (p. 2320) the Level of this Log Record.

Parameters:

value Level Enumeration Value

6.332.2.10 `void decaf::util::logging::LogRecord::setLoggerName (const std::string & loggerName) [inline]`

Sets the Source Logger's Name.

Parameters:

loggerName the source loggers name

6.332.2.11 `void decaf::util::logging::LogRecord::setMessage (const std::string & message)` [inline]

Sets the Message to be Logged.

Parameters:

message the source loggers message

6.332.2.12 `void decaf::util::logging::LogRecord::setSourceFile (const std::string & sourceFile)` [inline]

Sets the Source Log File Name.

Parameters:

sourceFile the source loggers name

6.332.2.13 `void decaf::util::logging::LogRecord::setSourceFunction (const std::string & functionName)` [inline]

Sets the name of the function where this log was logged.

Parameters:

functionName the source of the log

6.332.2.14 `void decaf::util::logging::LogRecord::setSourceLine (long sourceLine)` [inline]

Sets the Source Log line number.

Parameters:

sourceLine the source logger's line number

6.332.2.15 `void decaf::util::logging::LogRecord::setTimestamp (long timeStamp)` [inline]

Sets the time in mills that this message was logged.

Parameters:

timeStamp UTC Time in Milliseconds.

6.332.2.16 `void decaf::util::logging::LogRecord::setTreadId (long threadId)` [inline]

Sets the Thread Id where this Log was created.

Parameters:

threadId the source logger's line number

6.333.1.1 decaf::util::logging::LogWriter::LogWriter ()

6.333.1.2 virtual decaf::util::logging::LogWriter::~~LogWriter () [virtual]

6.333.2 Member Function Documentation

6.333.2.1 static void decaf::util::logging::LogWriter::destroy () [static]

Forcefully Delete the Instance of this **LogWriter** (p. 1650) even if there are outstanding references.

6.333.2.2 static LogWriter& decaf::util::logging::LogWriter::getInstance ()
[static]

Get the singleton instance.

6.333.2.3 virtual void decaf::util::logging::LogWriter::log (const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters:

message

6.333.2.4 virtual void decaf::util::logging::LogWriter::log (const std::string & *file*, const int *line*, const std::string & *prefix*, const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters:

file

line

prefix

message

6.333.2.5 static void decaf::util::logging::LogWriter::returnInstance () [static]

Returns a Checked out instance of this Writer.

Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static int **bitCount** (long long value)
Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static **Long decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a String into a **Long** (p. 1652).*
- static long long **highestOneBit** (long long value)
Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.
- static long long **lowestOneBit** (long long value)
Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (long long value)
Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.
- static int **numberOfTrailingZeros** (long long value)
Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.
- static long long **parseLong** (const std::string &value) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal long.
- static long long **parseLong** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Long** (p. 1652) object holding the value extracted from the specified string when parsed with the radix given by the second argument.*
- static long long **reverseBytes** (long long value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.
- static long long **reverse** (long long value)
Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.
- static long long **rotateLeft** (long long value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.
- static long long **rotateRight** (long long value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.
- static int **signum** (long long value)

Returns the signum function of the specified value.

- static std::string **toString** (long long value)

Converts the long to a String representation.

- static std::string **toString** (long long value, int radix)
- static std::string **toHexString** (long long value)

Returns a string representation of the integer argument as an unsigned integer in base 16.

- static std::string **toOctalString** (long long value)

Returns a string representation of the long long argument as an unsigned long long in base 8.

- static std::string **toBinaryString** (long long value)

Returns a string representation of the long long argument as an unsigned long long in base 2.

- static **Long** **valueOf** (long long value)

*Returns a **Long** (p. 1652) instance representing the specified int value.*

- static **Long** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

*Returns a **Long** (p. 1652) object holding the value given by the specified std::string.*

- static **Long** **valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)

*Returns a **Long** (p. 1652) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 64

The size in bits of the primitive long long type.

- static const long long **MAX_VALUE** = (long long)0x7FFFFFFFFFFFFFFFFFLL

The maximum value that the primitive type can hold.

- static const long long **MIN_VALUE** = (long long)0x8000000000000000LL

The minimum value that the primitive type can hold.

6.334.1 Constructor & Destructor Documentation

6.334.1.1 decaf::lang::Long::Long (long long value)

Parameters:

value - the primitive long long to wrap

6.334.1.2 decaf::lang::Long::Long (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value - the long long formatted string to wrap

Exceptions:

NumberFormatException

6.334.1.3 virtual decaf::lang::Long::~~Long () [inline, virtual]

6.334.2 Member Function Documentation

6.334.2.1 static int decaf::lang::Long::bitCount (long long *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value. This function is sometimes referred to as the population count.

Parameters:

value - the long long to count

Returns:

the number of one-bits in the two's complement binary representation of the specified long long value.

6.334.2.2 virtual unsigned char decaf::lang::Long::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1954).

6.334.2.3 virtual int decaf::lang::Long::compareTo (const long long & *l*) const [virtual]

Compares this **Long** (p. 1652) instance with another.

Parameters:

l - the **Integer** (p. 1428) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< long long > (p. 899).

6.334.2.4 virtual int decaf::lang::Long::compareTo (const Long & *l*) const
[virtual]

Compares this **Long** (p. 1652) instance with another.

Parameters:

l - the **Long** (p. 1652) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.334.2.5 static Long decaf::lang::Long::decode (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Decodes a String into a **Long** (p. 1652). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInt method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Long** (p. 1652) object containing the decoded value

Exceptions:

NumberFormatException if the string is not formatted correctly.

6.334.2.6 virtual double decaf::lang::Long::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.334.2.7 bool decaf::lang::Long::equals (const long long & *l*) const [inline, virtual]**Parameters:**

l - the **Long** (p. 1652) object to compare against.

Returns:

true if the two **Integer** (p.1428) Objects have the same value.

Implements **decaf::lang::Comparable**< **long long** > (p.900).

6.334.2.8 bool decaf::lang::Long::equals (const Long & l) const [inline]**Parameters:**

l - the **Long** (p.1652) object to compare against.

Returns:

true if the two **Integer** (p.1428) Objects have the same value.

6.334.2.9 virtual float decaf::lang::Long::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.334.2.10 static long long decaf::lang::Long::highestOneBit (long long value) [static]

Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the long long to be inspected

Returns:

an long long value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.334.2.11 virtual int decaf::lang::Long::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.334.2.12 `virtual long long decaf::lang::Long::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements `decaf::lang::Number` (p.1955).

6.334.2.13 `static long long decaf::lang::Long::lowestOneBit (long long value) [static]`

Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the long long to be inspected

Returns:

an long long value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.334.2.14 `static int decaf::lang::Long::numberOfLeadingZeros (long long value) [static]`

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value. Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

$\ast \text{floor}(\log_2(x)) = 63 - \text{numberOfLeadingZeros}(x) \ast \text{ceil}(\log_2(x)) = 64 - \text{numberOfLeadingZeros}(x - 1)$

Parameters:

value - the long long to be inspected

Returns:

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.334.2.15 `static int decaf::lang::Long::numberOfTrailingZeros (long long value) [static]`

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value. Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.334.2.16 virtual bool decaf::lang::Long::operator< (const long long & l) const
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< long long >** (p. 900).

6.334.2.17 virtual bool decaf::lang::Long::operator< (const Long & l) const
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.334.2.18 virtual bool decaf::lang::Long::operator== (const long long & l) const
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< long long >** (p. 901).

6.334.2.19 `virtual bool decaf::lang::Long::operator== (const Long & l) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.334.2.20 `static long long decaf::lang::Long::parseLong (const std::string & value,`
`int radix) throw (exceptions::NumberFormatException)` [static]

Returns a **Long** (p. 1652) object holding the value extracted from the specified string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed long in the radix specified by the second argument, exactly as if the arguments were given to the `parseLong(std::string, int)` method. The result is a **Long** (p. 1652) object that represents the long long value specified by the string.

Parameters:

value - String to parse

radix - the base encoding of the string

Returns:

long long value

Exceptions:

NumberFormatException on invalid string value

6.334.2.21 `static long long decaf::lang::Long::parseLong (const std::string & value)`
`throw (exceptions::NumberFormatException)` [static]

Parses the string argument as a signed decimal long. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting long value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseLong(java.lang.String, int)` method.

Note that the characters LL or ULL are not permitted to appear at the end of this string as would normally be permitted in a C++ program.

Parameters:

value - String to parse

Returns:

long long value

Exceptions:

NumberFormatException on invalid string value

6.334.2.22 static long long decaf::lang::Long::reverse (long long *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

Parameters:

value - the value whose bits are to be reversed

Returns:

the reversed bits long long.

6.334.2.23 static long long decaf::lang::Long::reverseBytes (long long *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

Parameters:

value - the long long whose bytes we are to reverse

Returns:

the reversed long long.

6.334.2.24 static long long decaf::lang::Long::rotateLeft (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits. (Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters:

value - the long long to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

6.334.2.25 static long long decaf::lang::Long::rotateRight (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits. (Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: `rotateRight(val, -distance) == rotateLeft(val, distance)`. Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: `rotateRight(val, distance) == rotateRight(val, distance & 0x1F)`.

Parameters:

value - the long long to be inspected
distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

6.334.2.26 `virtual short decaf::lang::Long::shortValue () const [inline, virtual]`

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from `decaf::lang::Number` (p.1956).

6.334.2.27 `static int decaf::lang::Long::signum (long long value) [static]`

Returns the signum function of the specified value. (The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters:

value - the long long to be inspected

Returns:

the signum function of the specified long long value.

6.334.2.28 `static std::string decaf::lang::Long::toBinaryString (long long value) [static]`

Returns a string representation of the long long argument as an unsigned long long in base 2. The unsigned long long value is the argument plus 2^{32} if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The characters '0' and '1' are used as binary digits.

Parameters:

value - the long long to be translated to a binary string

Returns:

the unsigned long long value as a binary string

6.334.2.29 `static std::string decaf::lang::Long::toHexString (long long value)`
 [static]

Returns a string representation of the integer argument as an unsigned integer in base 16. The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the `toUpperCase()` method may be called on the result:

Parameters:

value - the long long to be translated to an Octal string

Returns:

the unsigned long long value as a Octal string

6.334.2.30 `static std::string decaf::lang::Long::toOctalString (long long value)`
 [static]

Returns a string representation of the long long argument as an unsigned long long in base 8. The unsigned long long value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters:

value - the long long to be translated to an Octal string

Returns:

the unsigned long long value as a Octal string

6.334.2.31 `static std::string decaf::lang::Long::toString (long long value, int radix)`
 [static]**6.334.2.32** `static std::string decaf::lang::Long::toString (long long value)` [static]

Converts the long to a String representation.

Parameters:

value The long to convert to a std::string.

Returns:

string representation

6.334.2.33 `std::string decaf::lang::Long::toString () const`**Returns:**

this **Long** (p.1652) Object as a String Representation

6.334.2.34 `static Long decaf::lang::Long::valueOf (const std::string & value, int radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Long** (p.1652) object holding the value extracted from the specified `std::string` when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed long long in the radix specified by the second argument, exactly as if the argument were given to the `parseLong(std::string, int)` method. The result is a **Long** (p.1652) object that represents the long long value specified by the string.

Parameters:

value - `std::string` to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Long** (p.1652) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid long long.

6.334.2.35 `static Long decaf::lang::Long::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]`

Returns a **Long** (p.1652) object holding the value given by the specified `std::string`. The argument is interpreted as representing a signed decimal long long, exactly as if the argument were given to the `parseLong(std::string)` method. The result is a **Integer** (p.1428) object that represents the long long value specified by the string.

Parameters:

value - `std::string` to parse as base 10

Returns:

new **Long** (p.1652) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal long long.

6.334.2.36 `static Long decaf::lang::Long::valueOf (long long value) [inline, static]`

Returns a **Long** (p.1652) instance representing the specified `int` value.

Parameters:

value - the long long to wrap

Returns:

the new **Integer** (p. 1428) object wrapping value.

6.334.3 Field Documentation

6.334.3.1 `const long long decaf::lang::Long::MAX_VALUE = (long long)0x7FFFFFFFFFFFFFFFFLL [static]`

The maximum value that the primitive type can hold.

6.334.3.2 `const long long decaf::lang::Long::MIN_VALUE = (long long)0x8000000000000000LL [static]`

The minimum value that the primitive type can hold.

6.334.3.3 `const int decaf::lang::Long::SIZE = 64 [static]`

The size in bits of the primitive long long type.

6.335.1 Constructor & Destructor Documentation

6.335.1.1 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **IntArrayBuffer** (p. 1410) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

6.335.1.2 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (long long * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **LongArrayBuffer** (p. 1666) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.335.1.3 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer` (`ByteArrayPerspective & array`, `std::size_t offset`, `std::size_t capacity`, `bool readOnly = false`) `throw (` `decaf::lang::exceptions::IndexOutOfBoundsException` `)`

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset. The capacity and limit of the new **LongArrayBuffer** (p. 1666) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 729) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.335.1.4 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer` (`const` `LongArrayBuffer & other`)

Create a **LongArrayBuffer** (p. 1666) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.

Parameters:

other - the **LongArrayBuffer** (p. 1666) this one is to mirror.

6.335.1.5 `virtual decaf::internal::nio::LongArrayBuffer::~~LongArrayBuffer` (`)` `[virtual]`

6.335.2 Member Function Documentation

6.335.2.1 `virtual long long* decaf::internal::nio::LongArrayBuffer::array` (`)` `throw (decaf::lang::exceptions::UnsupportedOperationException,` `decaf::nio::ReadOnlyBufferException` `)` `[virtual]`

Returns the long long array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 1677).

6.335.2.2 `virtual std::size_t decaf::internal::nio::LongArrayBuffer::arrayOffset
() throw (decaf::lang::exceptions::UnsupportedOperationException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 1677).

6.335.2.3 `virtual LongBuffer* de-
caf::internal::nio::LongArrayBuffer::asReadOnlyBuffer ()
const [virtual]`

Creates a new, read-only long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only long long buffer which the caller then owns.

Implements **decaf::nio::LongBuffer** (p. 1677).

6.335.2.4 `virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::compact ()
throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p` = `position()` (p. 631) is copied

to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index **limit()** (p. 631) - 1 is copied to index $n = \mathbf{limit}() - 1 - p$. The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this LongBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1678).

6.335.2.5 **virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::duplicate ()**
[virtual]

Creates a new long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new long long Buffer which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1678).

6.335.2.6 **virtual long long decaf::internal::nio::LongArrayBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)**
[virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the long long is to be read

Returns:

the long long that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::LongBuffer** (p. 1680).

6.335.2.7 virtual long long decaf::internal::nio::LongArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the long long at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::LongBuffer** (p. 1680).

6.335.2.8 virtual bool decaf::internal::nio::LongArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible long long array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::LongBuffer** (p. 1680).

6.335.2.9 virtual bool decaf::internal::nio::LongArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 630).

6.335.2.10 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (std::size_t *index*, long long *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1681).

6.335.2.11 **virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (long long *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)** [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1681).

6.335.2.12 **virtual void decaf::internal::nio::LongArrayBuffer::setReadOnly (bool *value*)** [inline, protected, virtual]

Sets this **ByteBuffer** (p. 694) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.335.2.13 **virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::slice () const** [virtual]

Creates a new LongBuffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create LongBuffer which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1683).

The documentation for this class was generated from the following file:

Public Member Functions

- virtual **~LongBuffer** ()
- virtual std::string **toString** () const
- virtual long long * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the long long array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **LongBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only long long buffer that shares this buffer's content.
- virtual **LongBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **LongBuffer** * **duplicate** ()=0
Creates a new long long buffer that shares this buffer's content.
- virtual long long **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual long long **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **LongBuffer** & **get** (std::vector< long long > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **LongBuffer** & **get** (long long *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible long long array.
- **LongBuffer** & **put** (**LongBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the long longs remaining in the given source buffer long longo this buffer.

- **LongBuffer** & **put** (const long long *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers long longs long longo this buffer from the given source array.

- **LongBuffer** & **put** (std::vector< long long > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source long longs array long longo this buffer.

- virtual **LongBuffer** & **put** (long long value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given long longs long longo this buffer at the current position, and then increments the position.

- virtual **LongBuffer** & **put** (std::size_t index, long long value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given long longs long longo this buffer at the given index.

- virtual **LongBuffer** * **slice** () const =0

*Creates a new **LongBuffer** (p. 1674) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **LongBuffer** &value) const

Compares this object with the specified object for order.

- virtual bool **equals** (const **LongBuffer** &value) const

- virtual bool **operator==** (const **LongBuffer** &value) const

Compares equality between this object and the one passed.

- virtual bool **operator<** (const **LongBuffer** &value) const

Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **LongBuffer** * **allocate** (std::size_t capacity)

Allocates a new Double buffer.

- static **LongBuffer** * **wrap** (long long *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

*Wraps the passed buffer with a new **LongBuffer** (p. 1674).*

- static **LongBuffer** * **wrap** (std::vector< long long > &buffer)

*Wraps the passed STL long long Vector in a **LongBuffer** (p. 1674).*

Protected Member Functions

- **LongBuffer** (std::size_t capacity)

*Creates a **LongBuffer** (p. 1674) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.*

6.336.1 Detailed Description

This class defines four categories of operations upon long long buffers:.

- o Absolute and relative get and put methods that read and write single long longs;
- o Relative bulk get methods that transfer contiguous sequences of long longs from this buffer long longo an array;
- and o Relative bulk put methods that transfer contiguous sequences of long longs from a long long array or some other long long buffer long longo this buffer
- o Methods for compacting, duplicating, and slicing a long long buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing long long array long longo a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.336.2 Constructor & Destructor Documentation

6.336.2.1 decaf::nio::LongBuffer::LongBuffer (std::size_t capacity) [protected]

Creates a **LongBuffer** (p. 1674) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 627) in doubles

6.336.2.2 virtual decaf::nio::LongBuffer::~~LongBuffer () [inline, virtual]

6.336.3 Member Function Documentation

6.336.3.1 static LongBuffer* decaf::nio::LongBuffer::allocate (std::size_t capacity) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in long longs

Returns:

the **LongBuffer** (p. 1674) that was allocated, caller owns.

6.336.3.2 virtual long long* decaf::nio::LongBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the long long array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 627)

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1668).

6.336.3.3 virtual std::size_t decaf::nio::LongBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset long longo the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1669).

6.336.3.4 virtual LongBuffer* decaf::nio::LongBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only long long buffer which the caller then owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1669).

6.336.3.5 **virtual LongBuffer& decaf::nio::LongBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]**

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 631) - 1 is copied to index $n = \text{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **LongBuffer** (p. 1674)

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1669).

6.336.3.6 **virtual int decaf::nio::LongBuffer::compareTo (const LongBuffer & value) const [virtual]**

Compares this object with the specified object for order. Returns a negative long longeger, zero, or a positive long longeger as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative long longeger, zero, or a positive long longeger as this object is less than, equal to, or greater than the specified object.

6.336.3.7 **virtual LongBuffer* decaf::nio::LongBuffer::duplicate () [pure virtual]**

Creates a new long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new long long **Buffer** (p. 627) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1670).

6.336.3.8 virtual bool decaf::nio::LongBuffer::equals (const LongBuffer & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.336.3.9 LongBuffer& decaf::nio::LongBuffer::get (long long * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers long longs from this buffer long longo the given destination array. If there are fewer long longs remaining in the buffer than are required to satisfy the request, that is, if *length* > **remaining()** (p. 632), then no bytes are transferred and a **BufferUnderflowException** (p. 661) is thrown.

Otherwise, this method copies *length* long longs from this buffer long longo the given array, starting at the current position of this buffer and at the given *offset* in the array. The position of this buffer is then incremented by *length*.

Parameters:

buffer - long longer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than *length* long longs remaining in this buffer

NullPolong longerException if the passed buffer is null.

6.336.3.10 LongBuffer& decaf::nio::LongBuffer::get (std::vector< long long > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer long longo the given destination vector. An invocation of this method of the form *src.get(a)* behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call *buffer.resize(N)* before calling this get method.

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than *length* long longs remaining in this buffer

6.336.3.11 `virtual long long decaf::nio::LongBuffer::get (std::size_t index) const
throw (lang::exceptions::IndexOutOfBoundsException) [pure
virtual]`

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 627) where the long long is to be read

Returns:

the long long that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1670).

6.336.3.12 `virtual long long decaf::nio::LongBuffer::get () throw (
BufferUnderflowException) [pure virtual]`

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the long long at the current position

Exceptions:

BufferUnderflowException (p. 661) if there no more data to return

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1671).

6.336.3.13 `virtual bool decaf::nio::LongBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible long long array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1671).

6.336.3.14 `virtual bool decaf::nio::LongBuffer::operator< (const LongBuffer &
value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.336.3.15 `virtual bool decaf::nio::LongBuffer::operator==(const LongBuffer &value) const` [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.336.3.16 `virtual LongBuffer& decaf::nio::LongBuffer::put (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the long longs to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1671).

6.336.3.17 `virtual LongBuffer& decaf::nio::LongBuffer::put (long long value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters:

value - the long longs value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1672).

6.336.3.18 **LongBuffer& decaf::nio::LongBuffer::put (std::vector< long long > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)**

This method transfers the entire content of the given source long longs array long longo this buffer. This is the same as calling put(&buffer[0], 0, buffer.size())

Parameters:

buffer - The buffer whose contents are copied to this **LongBuffer** (p. 1674)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.336.3.19 **LongBuffer& decaf::nio::LongBuffer::put (const long long * buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)**

This method transfers long longs long longo this buffer from the given source array. If there are more long longs to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 632), then no long longs are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies length bytes from the given array long longo this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer- The array from which long longs are to be read

offset- The offset within the array of the first long long to be read;

length - The number of long longs to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.336.3.20 LongBuffer& decaf::nio::LongBuffer::put (LongBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the long longs remaining in the given source buffer long longo this buffer. If there are more long longs remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 632), then no long longs are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `n = src.remaining()` long longs from the given buffer long longo this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters:

src - the buffer to take long longs from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer for the remaining long longs in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.336.3.21 virtual LongBuffer* decaf::nio::LongBuffer::slice () const [pure virtual]

Creates a new **LongBuffer** (p. 1674) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **LongBuffer** (p. 1674) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1672).

6.336.3.22 `virtual std::string decaf::nio::LongBuffer::toString () const` [virtual]**Returns:**

a `std::string` describing this object

6.336.3.23 `static LongBuffer* decaf::nio::LongBuffer::wrap (std::vector< long long > & buffer)` [static]

Wraps the passed STL long long Vector in a **LongBuffer** (p. 1674). The new buffer will be backed by the given long long array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new **LongBuffer** (p. 1674) that is backed by *buffer*, caller owns.

6.336.3.24 `static LongBuffer* decaf::nio::LongBuffer::wrap (long long * array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)` [static]

Wraps the passed buffer with a new **LongBuffer** (p. 1674). The new buffer will be backed by the given long long array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **LongBuffer** (p. 1674) that is backed by *buffer*, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/LongBuffer.h`

6.337 activemq::util::LongSequenceGenerator Class Reference

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

```
#include <src/main/activemq/util/LongSequenceGenerator.h>
```

Public Member Functions

- **LongSequenceGenerator** ()
- virtual **~LongSequenceGenerator** ()
- long long **getNextSequenceId** ()
- long long **getLastSequenceId** ()

6.337.1 Detailed Description

This class is used to generate a sequence of long long values that are incremented each time a new value is requested. This class is thread safe so the ids can be requested in different **threads** (p. 66) safely.

6.337.2 Constructor & Destructor Documentation

6.337.2.1 **activemq::util::LongSequenceGenerator::LongSequenceGenerator** ()

6.337.2.2 **virtual**
activemq::util::LongSequenceGenerator::~~LongSequenceGenerator ()
[inline, virtual]

6.337.3 Member Function Documentation

6.337.3.1 **long long activemq::util::LongSequenceGenerator::getLastSequenceId** ()

Returns:

the last id that was generated.

6.337.3.2 **long long activemq::util::LongSequenceGenerator::getNextSequenceId** ()

Returns:

the next id in the sequence.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/LongSequenceGenerator.h`

6.338 decaf::net::MalformedURLException Class Reference

#include <src/main/decaf/net/MalformedURLException.h> Inheritance diagram for decaf::net::MalformedURLException:

Public Member Functions

- **MalformedURLException** () throw ()
Default Constructor.
- **MalformedURLException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **MalformedURLException** (const **MalformedURLException** &ex) throw ()
Copy Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **MalformedURLException** (const std::exception *cause) throw ()
Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **MalformedURLException** * clone () const
Clones this exception.
- virtual ~**MalformedURLException** () throw ()

6.338.1 Constructor & Destructor Documentation

6.338.1.1 decaf::net::MalformedURLException::MalformedURLException () throw () [inline]

Default Constructor.

6.338.1.2 decaf::net::MalformedURLException::MalformedURLException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.338.1.3 decaf::net::MalformedURLException::MalformedURLException (const MalformedURLException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.338.1.4 decaf::net::MalformedURLException::MalformedURLException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.338.1.5 decaf::net::MalformedURLException::MalformedURLException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.338.1.6 decaf::net::MalformedURLException::MalformedURLException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.338.1.7 `virtual decaf::net::MalformedURLException::~~MalformedURLException
() throw () [inline, virtual]`

6.338.2 Member Function Documentation

6.338.2.1 `virtual MalformedURLException* de-
caf::net::MalformedURLException::clone () const
[inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/MalformedURLException.h`

6.339 decaf::util::Map< K, V, COMPARATOR > Class Template Reference

Map (p.1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

#include <src/main/decaf/util/Map.h> Inheritance diagram for decaf::util::Map< K, V, COMPARATOR >:

Data Structures

- class **Entry**

Public Member Functions

- **Map** ()
Default constructor - does nothing.
- virtual ~**Map** ()
- virtual bool **equals** (const **Map** &source) const =0
Comparison, equality is dependent on the method of determining if the element are equal.
- virtual void **copy** (const **Map** &source)=0
Copies the content of the source map into this map.
- virtual void **clear** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
- virtual bool **containsKey** (const K &key) const =0
Indicates whether or this map contains a value for the given key.
- virtual bool **containsValue** (const V &value) const =0
Indicates whether or this map contains a value for the given value, i.e.
- virtual bool **isEmpty** () const =0
- virtual std::size_t **size** () const =0
- virtual V & **get** (const K &key)=0 throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p.1689).*
- virtual const V & **get** (const K &key) const =0 throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p.1689).*
- virtual void **put** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
Sets the value for the specified key.

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)

*Stores a copy of the Mappings contained in the other **Map** (p. 1689) in this one.*

- virtual V **remove** (const K &key)=0 throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

- virtual std::vector< K > **keySet** () const =0

*Returns a **Set** (p. 2320) view of the mappings contained in this map.*

- virtual std::vector< V > **values** () const =0

6.339.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>
class decaf::util::Map< K, V, COMPARATOR >
```

Map (p. 1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

6.339.2 Constructor & Destructor Documentation

6.339.2.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::Map< K, V, COMPARATOR >::Map () [inline]`

Default constructor - does nothing.

6.339.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::Map< K, V, COMPARATOR >::~~Map () [inline, virtual]`

6.339.3 Member Function Documentation

6.339.3.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::clear () throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Removes all keys and values from this map.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 922), `decaf::util::StlMap< K, V, COMPARATOR >`

(p. 2433), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 922), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2433), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2433), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2433), decaf::util::StlMap< std::string, cms::Queue * > (p. 2433), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2433), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, TransportFactory * > (p. 2433), decaf::util::StlMap< int, Pointer< Command > > (p. 2433), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, CachedProducer * > (p. 2433), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2433).

6.339.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::containsKey (const K & *key*) const [pure virtual]

Indicates whether or this map contains a value for the given key.

Parameters:

key The key to look up.

Returns:

true if this map contains the value, otherwise false.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 922), decaf::util::StlMap< K, V, COMPARATOR > (p. 2433), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 922), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 922), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2433), decaf::util::StlMap< std::string,

WireFormatFactory * > (p. 2433), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2433), decaf::util::StlMap< std::string, cms::Queue * > (p. 2433), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2433), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, TransportFactory * > (p. 2433), decaf::util::StlMap< int, Pointer< Command > > (p. 2433), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, CachedProducer * > (p. 2433), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2433).

6.339.3.3 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR
>::containsValue (const V & value) const [pure virtual]`

Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters:

value The Value to look up.

Returns:

true if this map contains the value, otherwise false.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 923), decaf::util::StlMap< K, V, COMPARATOR > (p. 2433), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 923), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 923), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 923), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 923), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 923), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 923), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2433), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2433), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2433), decaf::util::StlMap< std::string, cms::Queue * > (p. 2433), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2433), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, TransportFactory * > (p. 2433), decaf::util::StlMap< int, Pointer< Command > > (p. 2433), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2433), decaf::util::StlMap< std::string, CachedProducer * > (p. 2433), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2433).

6.339.3.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & source) [pure virtual]`

Copies the content of the source map into this map. Erases all existing data in this map.

Parameters:

source The source object to copy from.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 923), and `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2434).

6.339.3.5 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & source) const [pure virtual]`

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters:

source - **Map** (p. 1689) to compare to this one.

Returns:

true if the **Map** (p. 1689) passed is equal in value to this one.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 924), and `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2434).

6.339.3.6 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::Map< K, V, COMPARATOR >::get (const K & key) const throw (lang::exceptions::NoSuchElementException) [pure virtual]`

Gets the value mapped to the specified key in the **Map** (p. 1689). If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters:

key The search key.

Returns:

A {const} reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1689).

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 924), `decaf::util::StlMap< K, V, COMPARATOR >`

> (p. 925), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 925), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 925), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2435), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2435), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2435), decaf::util::StlMap< std::string, cms::Queue * > (p. 2435), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2435), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2435), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2435), decaf::util::StlMap< std::string, TransportFactory * > (p. 2435), decaf::util::StlMap< int, Pointer< Command > > (p. 2435), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2435), decaf::util::StlMap< std::string, CachedProducer * > (p. 2435), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2435).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals().

6.339.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::isEmpty() const [pure virtual]

Returns:

if the **Map** (p. 1689) contains any element or not, TRUE or FALSE

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 925), decaf::util::StlMap< K, V, COMPARATOR > (p. 2435), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 925), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 925), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 925), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 925), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 925), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 925), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2435), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2435), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2435), decaf::util::StlMap< std::string, cms::Queue * > (p. 2435), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2435), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2435), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2435), decaf::util::StlMap< std::string, TransportFactory * > (p. 2435), decaf::util::StlMap< int, Pointer< Command > > (p. 2435), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2435), decaf::util::StlMap< std::string, CachedProducer * > (p. 2435), and

`decaf::util::StlMap< std::string, cms::Topic * >` (p. 2435).

6.339.3.9 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual std::vector<K> decaf::util::Map< K, V,
COMPARATOR >::keySet () const [pure virtual]`

Returns a **Set** (p. 2320) view of the mappings contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the set `Value` operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1490), **Set.remove** (p. 130), `removeAll`, `retainAll` and `clear` operations. It does not support the `add` or `addAll` operations.

Returns:

the entire set of keys in this map as a `std::vector`.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 925), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2435), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 925), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 925), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 925), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 925), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 925), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 925), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2435), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2435), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2435), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2435), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2435), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2435), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2435), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2435), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2435), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2435), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2435), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2435).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::equals()`, and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals()`.

6.339.3.10 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::put (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Sets the value for the specified key.

Parameters:

key The target key.

value The value to be set.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 926), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2437), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 926), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 926), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 926), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 926), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 926), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 926), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2437), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2437), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2437), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2437), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2437), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2437), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2437), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2437), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2437), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2437), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2437), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2437).

6.339.3.11 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 1689) in this one.

Parameters:

other A **Map** (p. 1689) instance whose elements are to all be inserted in this **Map** (p. 1689).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 927), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2437), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 927), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2437), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2437), and `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2437).

```
6.339.3.12  template<typename K, typename V, typename COMPARATOR
            = std::less<K>> virtual V decaf::util::Map< K, V,
            COMPARATOR >::remove (const K & key) throw
            ( decaf::lang::exceptions::NoSuchElementException,
            decaf::lang::exceptions::UnsupportedOperationException ) [pure
            virtual]
```

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters:

key The search key.

Returns:

a copy of the element that was previously mapped to the given key

Exceptions:

NoSuchElementException if this key is not in the **Map** (p. 1689).

UnsupportedOperationException if this map is unmodifiable.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 929), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2438), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 929), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >`

(p. 929), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 929), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 929), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 929), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 929), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2438), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2438), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2438), decaf::util::StlMap< std::string, cms::Queue * > (p. 2438), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2438), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2438), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2438), decaf::util::StlMap< std::string, TransportFactory * > (p. 2438), decaf::util::StlMap< int, Pointer< Command > > (p. 2438), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2438), decaf::util::StlMap< std::string, CachedProducer * > (p. 2438), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2438).

6.339.3.13 template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual std::size_t decaf::util::Map< K, V,
COMPARATOR >::size () const [pure virtual]

Returns:

The number of elements (key/value pairs) in this map.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 930), decaf::util::StlMap< K, V, COMPARATOR > (p. 2438), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 930), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 930), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 930), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 930), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 930), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 930), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2438), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2438), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2438), decaf::util::StlMap< std::string, cms::Queue * > (p. 2438), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2438), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2438), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2438), decaf::util::StlMap< std::string, TransportFactory * > (p. 2438), decaf::util::StlMap< int, Pointer< Command > > (p. 2438), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR

> (p. 2438), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2438), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2438).

6.339.3.14 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual std::vector<V> decaf::util::Map< K, V,
COMPARATOR >::values () const [pure virtual]`

Returns:

the entire set of values in this map as a `std::vector`.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 931), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2438), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 931), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 931), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 931), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 931), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 931), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 931), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2438), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2438), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2438), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2438), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2438), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2438), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2438), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2438), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2438), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2438), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2438), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2438).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Map.h`

6.340 cms::MapMessage Class Reference

A **MapMessage** (p.1701) object is used to send a set of name-value pairs.

#include <src/main/cms/MapMessage.h> Inheritance diagram for cms::MapMessage:

Public Member Functions

- virtual **~MapMessage** ()
- virtual std::vector< std::string > **getMapNames** () const =0 throw (CMSEException)
*Returns an Enumeration of all the names in the **MapMessage** (p. 1701) object.*
- virtual bool **itemExists** (const std::string &name) const =0 throw (CMSEException)
*Indicates whether an item exists in this **MapMessage** (p. 1701) object.*
- virtual bool **getBoolean** (const std::string &name) const =0 throw (CMSEException)
Returns the Boolean value of the Specified name.
- virtual void **setBoolean** (const std::string &name, bool value)=0 throw (CMSEException)
Sets a boolean value with the specified name into the Map.
- virtual unsigned char **getByte** (const std::string &name) const =0 throw (CMSEException)
Returns the Byte value of the Specified name.
- virtual void **setByte** (const std::string &name, unsigned char value)=0 throw (CMSEException)
Sets a Byte value with the specified name into the Map.
- virtual std::vector< unsigned char > **getBytes** (const std::string &name) const =0 throw (CMSEException)
Returns the Bytes value of the Specified name.
- virtual void **setBytes** (const std::string &name, const std::vector< unsigned char > &value)=0 throw (CMSEException)
Sets a Bytes value with the specified name into the Map.
- virtual char **getChar** (const std::string &name) const =0 throw (CMSEException)
Returns the Char value of the Specified name.
- virtual void **setChar** (const std::string &name, char value)=0 throw (CMSEException)
Sets a Char value with the specified name into the Map.
- virtual double **getDouble** (const std::string &name) const =0 throw (CMSEException)
Returns the Double value of the Specified name.
- virtual void **setDouble** (const std::string &name, double value)=0 throw (CMSEException)

Sets a Double value with the specified name into the Map.

- virtual float **getFloat** (const std::string &name) const =0 throw (CMSEException)
Returns the Float value of the Specified name.
- virtual void **setFloat** (const std::string &name, float value)=0 throw (CMSEException)
Sets a Float value with the specified name into the Map.
- virtual int **getInt** (const std::string &name) const =0 throw (CMSEException)
Returns the Int value of the Specified name.
- virtual void **setInt** (const std::string &name, int value)=0 throw (CMSEException)
Sets a Int value with the specified name into the Map.
- virtual long long **getLong** (const std::string &name) const =0 throw (CMSEException)
Returns the Long value of the Specified name.
- virtual void **setLong** (const std::string &name, long long value)=0 throw (CMSEException)
Sets a Long value with the specified name into the Map.
- virtual short **getShort** (const std::string &name) const =0 throw (CMSEException)
Returns the Short value of the Specified name.
- virtual void **setShort** (const std::string &name, short value)=0 throw (CMSEException)
Sets a Short value with the specified name into the Map.
- virtual std::string **getString** (const std::string &name) const =0 throw (CMSEException)
Returns the String value of the Specified name.
- virtual void **setString** (const std::string &name, const std::string &value)=0 throw (CMSEException)
Sets a String value with the specified name into the Map.

6.340.1 Detailed Description

A **MapMessage** (p.1701) object is used to send a set of name-value pairs. The names are String objects, and the values are primitive data types in the Java programming language. The names must have a value that is not null, and not an empty string. The entries can be accessed sequentially or randomly by name. The order of the entries is undefined. **MapMessage** (p.1701) inherits from the **Message** (p.1753) interface and adds a message body that contains a Map.

When a client receives a **MapMessage** (p.1701), it is in read-only mode. If a client attempts to write to the message at this point, a **MessageNotWriteableException** (p.1877) is thrown. To place the **MapMessage** (p.1701) back into a state where it can be read from and written to, call the **clearBody** method.

MapMessage (p.1701) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p.850). The String-to-primitive conversions may throw a **MessageFormatException** (p.1842) if the primitive's **valueOf()** method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X									X
byte		X	X		X	X				X
short			X		X	X				X
char				X						X
int					X	X				X
long						X				X
float							X	X		X
double								X		X
String	X	X	X		X	X	X	X	X	
byte[]										X

6.340.2 Constructor & Destructor Documentation

6.340.2.1 virtual cms::MapMessage::~MapMessage () [inline, virtual]

6.340.3 Member Function Documentation

6.340.3.1 virtual bool cms::MapMessage::getBoolean (const std::string & *name*) const throw (CMSEException) [pure virtual]

Returns the Boolean value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 259).

6.340.3.2 virtual unsigned char cms::MapMessage::getBytes (const std::string & *name*) const throw (CMSEException) [pure virtual]

Returns the Byte value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 259).

6.340.3.3 `virtual std::vector<unsigned char> cms::MapMessage::getBytes (const std::string & name) const throw (CMSEException) [pure virtual]`

Returns the Bytes value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 259).

6.340.3.4 `virtual char cms::MapMessage::getChar (const std::string & name) const throw (CMSEException) [pure virtual]`

Returns the Char value of the Specified name.

Parameters:

name name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 260).

6.340.3.5 `virtual double cms::MapMessage::getDouble (const std::string & name) const throw (CMSEException) [pure virtual]`

Returns the Double value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 260).

6.340.3.6 virtual float cms::MapMessage::getFloat (const std::string & *name*) const throw (CMSEException) [pure virtual]

Returns the Float value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 260).

6.340.3.7 virtual int cms::MapMessage::getInt (const std::string & *name*) const throw (CMSEException) [pure virtual]

Returns the Int value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 261).

6.340.3.8 virtual long long cms::MapMessage::getLong (const std::string & *name*) const throw (CMSEException) [pure virtual]

Returns the Long value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 261).

6.340.3.9 virtual std::vector< std::string > cms::MapMessage::getMapNames () const throw (CMSEException) [pure virtual]

Returns an Enumeration of all the names in the **MapMessage** (p. 1701) object.

Returns:

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 1701)

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 262).

6.340.3.10 `virtual short cms::MapMessage::getShort (const std::string & name)
const throw (CMSEException) [pure virtual]`

Returns the Short value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 262).

6.340.3.11 `virtual std::string cms::MapMessage::getString (const std::string &
name) const throw (CMSEException) [pure virtual]`

Returns the String value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 262).

6.340.3.12 `virtual bool cms::MapMessage::itemExists (const std::string & name)
const throw (CMSEException) [pure virtual]`

Indicates whether an item exists in this **MapMessage** (p. 1701) object.

Parameters:

name String name of the Object in question

Returns:

boolean value indicating if the name is in the map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 263).

6.340.3.13 `virtual void cms::MapMessage::setBoolean (const std::string & name, bool value) throw (CMSEException)` [pure virtual]

Sets a boolean value with the specified name into the Map.

Parameters:

name the name of the boolean

value the boolean value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageNotWritableException - if the `Message` (p. 1753) is in Read-only Mode.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 263).

6.340.3.14 `virtual void cms::MapMessage::setByte (const std::string & name, unsigned char value) throw (CMSEException)` [pure virtual]

Sets a Byte value with the specified name into the Map.

Parameters:

name the name of the Byte

value the Byte value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageNotWritableException - if the `Message` (p. 1753) is in Read-only Mode.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 263).

6.340.3.15 `virtual void cms::MapMessage::setBytes (const std::string & name, const std::vector< unsigned char > & value) throw (CMSEException)` [pure virtual]

Sets a Bytes value with the specified name into the Map.

Parameters:

name The name of the Bytes

value The Bytes value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageNotWritableException - if the **Message** (p. 1753) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 264).

6.340.3.16 `virtual void cms::MapMessage::setChar (const std::string & name, char value) throw (CMSEException)` [pure virtual]

Sets a Char value with the specified name into the Map.

Parameters:

name the name of the Char
value the Char value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.
MessageNotWritableException - if the **Message** (p. 1753) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 264).

6.340.3.17 `virtual void cms::MapMessage::setDouble (const std::string & name, double value) throw (CMSEException)` [pure virtual]

Sets a Double value with the specified name into the Map.

Parameters:

name The name of the Double
value The Double value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.
MessageNotWritableException - if the **Message** (p. 1753) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 264).

6.340.3.18 `virtual void cms::MapMessage::setFloat (const std::string & name, float value) throw (CMSEException)` [pure virtual]

Sets a Float value with the specified name into the Map.

Parameters:

name The name of the Float
value The Float value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.
MessageNotWritableException - if the **Message** (p. 1753) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 265).

6.340.3.19 `virtual void cms::MapMessage::setInt (const std::string & name, int value) throw (CMSEException) [pure virtual]`

Sets a Int value with the specified name into the Map.

Parameters:

name The name of the Int

value The Int value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageNotWritableException - if the Message (p.1753) is in Read-only Mode.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 265).

6.340.3.20 `virtual void cms::MapMessage::setLong (const std::string & name, long long value) throw (CMSEException) [pure virtual]`

Sets a Long value with the specified name into the Map.

Parameters:

name The name of the Long

value The Long value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageNotWritableException - if the Message (p.1753) is in Read-only Mode.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 265).

6.340.3.21 `virtual void cms::MapMessage::setShort (const std::string & name, short value) throw (CMSEException) [pure virtual]`

Sets a Short value with the specified name into the Map.

Parameters:

name The name of the Short

value The Short value to set in the Map

Exceptions:

CMSEException (p. 850) - if the operation fails due to an internal error.

MessageNotWritableException - if the Message (p.1753) is in Read-only Mode.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 266).

6.340.3.22 `virtual void cms::MapMessage::setString (const std::string & name,
const std::string & value) throw (CMSException)` [pure virtual]

Sets a String value with the specified name into the Map.

Parameters:

name The name of the String

value The String value to set in the Map

Exceptions:

CMSException (p. 850) - if the operation fails due to an internal error.

MessageNotWritableException - if the **Message** (p. 1753) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 266).

The documentation for this class was generated from the following file:

- `src/main/cms/MapMessage.h`

6.341 decaf::util::logging::MarkBlockLogger Class Reference

Defines a class that can be used to mark the entry and exit from scoped blocks.

```
#include <src/main/decaf/util/logging/MarkBlockLogger.h>
```

Public Member Functions

- **MarkBlockLogger** (**Logger** *logger, const std::string &blockName)
Constructor - Marks Block entry.
- virtual ~**MarkBlockLogger** ()

6.341.1 Detailed Description

Defines a class that can be used to mark the entry and exit from scoped blocks. Create an instance of this class at the start of a scoped block, passing it the logger to use and the name of the block. The block entry and exit will be marked using the scope name, logger to the logger at the MARKBLOCK log level.

6.341.2 Constructor & Destructor Documentation

6.341.2.1 decaf::util::logging::MarkBlockLogger::MarkBlockLogger (**Logger** *logger, const std::string & blockName) [inline]

Constructor - Marks Block entry.

Parameters:

logger **Logger** (p.1623) to use
blockName Block name

6.341.2.2 virtual decaf::util::logging::MarkBlockLogger::~MarkBlockLogger () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/MarkBlockLogger.h

6.342 activemq::wireformat::MarshalAware Class Reference

#include <src/main/activemq/wireformat/MarshalAware.h> Inheritance diagram for activemq::wireformat::MarshalAware:

Public Member Functions

- virtual `~MarshalAware ()`
- virtual `bool isMarshalAware () const =0`
Determine if the class implementing this interface is really wanting to be told about marshaling.
- virtual `void beforeMarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called before marshaling is started to prepare the object to be marshaled.
- virtual `void afterMarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called after marshaling is started to cleanup the object being marshaled.
- virtual `void beforeUnmarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called before unmarshaling is started to prepare the object to be unmarshaled.
- virtual `void afterUnmarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual `void setMarshaledForm (WireFormat *wireFormat, const std::vector< char > &data)=0`
Called to set the data to this object that will contain the objects marshaled form.
- virtual `std::vector< unsigned char > getMarshaledForm (WireFormat *wireFormat)=0`
Called to get the data to this object that will contain the objects marshaled form.

6.342.1 Constructor & Destructor Documentation

- 6.342.1.1** `virtual activemq::wireformat::MarshalAware::~~MarshalAware ()`
[inline, virtual]

6.342.2 Member Function Documentation

- 6.342.2.1** `virtual void activemq::wireformat::MarshalAware::afterMarshal (WireFormat * wireFormat) throw (decaf::io::IOException)` [pure virtual]

Called after marshaling is started to cleanup the object being marshaled.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control marshaling

6.342.2.2 virtual void activemq::wireformat::MarshalAware::afterUnmarshal
(WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure
virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control unmarshaling

6.342.2.3 virtual void activemq::wireformat::MarshalAware::beforeMarshal
(WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure
virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control marshaling

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 257), and **activemq::commands::ActiveMQStreamMessage** (p. 376).

6.342.2.4 virtual void activemq::wireformat::MarshalAware::beforeUnmarshal
(WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure
virtual]

Called before unmarshaling is started to prepare the object to be unmarshaled.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control unmarshaling

6.342.2.5 virtual std::vector<unsigned char> activemq::wireformat::MarshalAware::getMarshaledForm
(WireFormat * *wireFormat*) [pure virtual]

Called to get the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control unmarshaling

Returns:

buffer that holds the objects data.

6.342.2.6 `virtual bool activemq::wireformat::MarshalAware::isMarshalAware ()` `const` [pure virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling. Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns:

true if this class cares about marshaling.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 262), `activemq::commands::ActiveMQStreamMessage` (p. 378), `activemq::commands::BaseDataStructure` (p. 559), `activemq::commands::Message` (p. 1746), and `activemq::commands::WireFormatInfo` (p. 2704).

6.342.2.7 `virtual void activemq::wireformat::MarshalAware::setMarshaledForm` `(WireFormat * wireFormat, const std::vector< char > & data)` [pure virtual]

Called to set the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat - the `wireformat` (p. 74) object to control unmarshaling
data - vector of object binary data

Static Public Member Functions

- static int **abs** (int value)
Returns the absolute value of an int value.
- static long long **abs** (long long value)
Returns the absolute value of an long long value.
- static float **abs** (float value)
Returns the absolute value of a float value.
- static double **abs** (double value)
Returns the absolute value of a double value.
- static double **sqrt** (double value)
Returns the arc cosine of an angle, in the range of 0.0 through pi.
- static double **pow** (double base, double exp)
Returns the value of the first argument raised to the power of the second argument.
- static short **min** (short a, short b)
Returns the double value that is closest in value to the argument and is equal to a mathematical integer.
- static int **min** (int a, int b)
*Returns the smaller of two *int* values.*
- static int **min** (unsigned int a, unsigned int b)
*Returns the smaller of two *unsigned int* values.*
- static long long **min** (long long a, long long b)
*Returns the smaller of two *long long* values.*
- static float **min** (float a, float b)
Returns the smaller of two float values.
- static double **min** (double a, double b)
Returns the smaller of two double values.

- static short **max** (short a, short b)
*Returns the larger of two **short** values.*
- static int **max** (int a, int b)
*Returns the larger of two **int** values.*
- static long long **max** (long long a, long long b)
*Returns the larger of two **long long** values.*
- static float **max** (float a, float b)
Returns the greater of two float values.
- static double **max** (double a, double b)
Returns the greater of two double values.
- static double **ceil** (double value)
Returns the natural logarithm (base e) of a double value.
- static double **floor** (double value)
Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.
- static int **round** (float value)
Returns the closest int to the argument.
- static long long **round** (double value)
Returns the closest long long to the argument.
- static double **random** ()
Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.
- static float **signum** (float value)
Returns Euler's number e raised to the power of a double value.
- static double **signum** (double value)
Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.
- static double **toRadians** (double angdeg)
Returns the measure in radians of the supplied degree angle.
- static double **toDegrees** (double angrad)
Returns the measure in degrees of the supplied radian angle.

- static const double **E**
- static const double **PI**

6.346.1 Detailed Description

The class `Math` (p. 1718) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

6.346.2 Constructor & Destructor Documentation

6.346.2.1 `decaf::lang::Math::Math ()` [inline]

6.346.2.2 `virtual decaf::lang::Math::~~Math ()` [inline, virtual]

6.346.3 Member Function Documentation

6.346.3.1 `static double decaf::lang::Math::abs (double value)` [static]

Returns the absolute value of a double value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

- o If the argument is positive zero or negative zero, the result is positive zero.
- o If the argument is infinite, the result is positive infinity.
- o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: `Double::longBitsToDouble` (p. 1237)(`0x7fffffffffffffffULL & Double::doubleToLongBits(value)`)

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.346.3.2 `static float decaf::lang::Math::abs (float value)` [static]

Returns the absolute value of a float value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

- o If the argument is positive zero or negative zero, the result is positive zero.
- o If the argument is infinite, the result is positive infinity.
- o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: `Float::intBitsToFloat` (p. 1333)(`0x7fffffff & Float::floatToIntBits(value)`)

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.346.3.3 `static long long decaf::lang::Math::abs (long long value)` [inline, static]

Returns the absolute value of an long long value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.346.3.4 static int decaf::lang::Math::abs (int *value*) [inline, static]

Returns the absolute value of an int value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.346.3.5 static double decaf::lang::Math::ceil (double *value*) [static]

Returns the natural logarithm (base e) of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity.

Parameters:

value the value to compute the natural log of.

Returns:

the natural log of value. Returns the base 10 logarithm of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity. o If the argument is equal to 10ⁿ for integer n, then the result is n.

Parameters:

value - the value to operate on

Returns:

the long base 10 of value Returns the natural logarithm of the sum of the argument and 1. Note that for small values x, the result of log1p(x) is much closer to the true result of ln(1 + x) than the floating-point evaluation of log(1.0+x).

Special cases:

o If the argument is NaN or less than -1, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative one, then the result is negative infinity. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to operate on

Returns:

the the value $\ln(x + 1)$, the natural log of $x + 1$ Returns the smallest (closest to negative infinity) double value that is greater than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument. o If the argument value is less than zero but greater than -1.0, then the result is negative zero.

Note that the value of `Math.ceil(x)` is exactly the value of `-Math.floor(-x)`.

Parameters:

value - the value to find the ceiling of

Returns:

the smallest (closest to negative infinity) floating-point value that is greater than or equal to the argument and is equal to a mathematical integer.

6.346.3.6 static double decaf::lang::Math::floor (double *value*) [static]

Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the value to find the floor of

Returns:

the largest (closest to positive infinity) floating-point value that less than or equal to the argument and is equal to a mathematical integer.

6.346.3.7 static double decaf::lang::Math::max (double *a*, double *b*) [static]

Returns the greater of two double values. That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of *a* and *b*.

6.346.3.8 static float decaf::lang::Math::max (float *a*, float *b*) [static]

Returns the greater of two float values. That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of *a* and *b*.

6.346.3.9 static long long decaf::lang::Math::max (long long *a*, long long *b*) [inline, static]

Returns the larger of two long long values. That is, the result the argument closer to the value of `Long::MAX_VALUE` (p.1665). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of *a* and *b*.

6.346.3.10 static int decaf::lang::Math::max (int *a*, int *b*) [inline, static]

Returns the larger of two int values. That is, the result the argument closer to the value of `Integer::MAX_VALUE` (p.1441). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of *a* and *b*.

6.346.3.11 static short decaf::lang::Math::max (short *a*, short *b*) [inline, static]

Returns the larger of two `short` values. That is, the result the argument closer to the value of `Short::MAX_VALUE` (p. 2329). If the arguments have the same value, the result is that same value.

Parameters:

- a* - an argument.
- b* - another argument.

Returns:

the larger of *a* and *b*.

6.346.3.12 static double decaf::lang::Math::min (double *a*, double *b*) [static]

Returns the smaller of two double values. That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters:

- a* - an argument.
- b* - another argument.

Returns:

the smaller of *a* and *b*.

6.346.3.13 static float decaf::lang::Math::min (float *a*, float *b*) [static]

Returns the smaller of two float values. That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters:

- a* - an argument.
- b* - another argument.

Returns:

the smaller of *a* and *b*.

6.346.3.14 static long long decaf::lang::Math::min (long long *a*, long long *b*)
[inline, static]

Returns the smaller of two `long long` values. That is, the result the argument closer to the value of `Long::MIN_VALUE` (p.1665). If the arguments have the same value, the result is that same value.

Parameters:

- a* - an argument.
- b* - another argument.

Returns:

the smaller of *a* and *b*.

6.346.3.15 static int decaf::lang::Math::min (unsigned int *a*, unsigned int *b*)
[inline, static]

Returns the smaller of two `unsigned int` values. That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p.1441). If the arguments have the same value, the result is that same value.

Parameters:

- a* - an argument.
- b* - another argument.

Returns:

the smaller of *a* and *b*.

6.346.3.16 static int decaf::lang::Math::min (int *a*, int *b*) [inline, static]

Returns the smaller of two `int` values. That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p.1441). If the arguments have the same value, the result is that same value.

Parameters:

- a* - an argument.
- b* - another argument.

Returns:

the smaller of *a* and *b*.

6.346.3.17 static short decaf::lang::Math::min (short *a*, short *b*) [inline, static]

Returns the double value that is closest in value to the argument and is equal to a mathematical integer. If two double values that are mathematical integers are equally close, the result is the integer value that is even. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the value to round to the nearest integer

Returns:

the rounded value Returns the smaller of two short values. That is, the result is the argument closer to the value of `decaf::lang::Short::MIN_VALUE` (p. 2329). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of *a* and *b*.

6.346.3.18 `static double decaf::lang::Math::pow (double base, double exp)` [static]

Returns the value of the first argument raised to the power of the second argument. Special cases:

o If the second argument is positive or negative zero, then the result is 1.0. o If the second argument is 1.0, then the result is the same as the first argument. o If the second argument is NaN, then the result is NaN. o If the first argument is NaN and the second argument is nonzero, then the result is NaN.

Parameters:

base - the base

exp - the exponent

Returns:

the base raised to the power of *exp*.

6.346.3.19 `static double decaf::lang::Math::random ()` [static]

Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard. The remainder value is mathematically equal to $f1 - f2 \times n$, where *n* is the mathematical integer closest to the exact mathematical value of the quotient $f1/f2$, and if two mathematical integers are equally close to $f1/f2$, then *n* is the integer that is even. If the remainder is zero, its sign is the same as the sign of the first argument. Special cases:

o If either argument is NaN, or the first argument is infinite, or the second argument is positive zero or negative zero, then the result is NaN. o If the first argument is finite and the second argument is infinite, then the result is the same as the first argument.

Parameters:*f1* - the dividend.*f2* - the divisor**Returns:**

the IEEE remainder of value Returns a double value with a positive sign, greater than or equal to 0.0 and less than 1.0. Returned values are chosen pseudorandomly with (approximately) uniform distribution from that range.

When this method is first called, it creates a single new pseudorandom-number generator; This new pseudorandom-number generator is used thereafter for all calls to this method and is used nowhere else.

This method is properly synchronized to allow correct use by more than one thread. However, if many threads need to generate pseudorandom numbers at a great rate, it may reduce contention for each thread to have its own pseudorandom-number generator.

Returns:

a pseudorandom double greater than or equal to 0.0 and less than 1.0.

6.346.3.20 static long long decaf::lang::Math::round (double *value*) [static]

Returns the closest long long to the argument. The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type long long. In other words, the result is equal to the value of the expression: (long long) **Math.floor** (p.1722)(a + 0.5d)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Long::MIN_VALUE** (p.1665), the result is equal to the value of **Long::MIN_VALUE** (p.1665). o If the argument is positive infinity or any value greater than or equal to the value of **Long::MAX_VALUE** (p.1665), the result is equal to the value of **Long::MAX_VALUE** (p.1665).

Parameters:*value* - the value to round**Returns:**

the value of the argument rounded to the nearest integral value.

6.346.3.21 static int decaf::lang::Math::round (float *value*) [static]

Returns the closest int to the argument. The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type int. In other words, the result is equal to the value of the expression: (int) **Math.floor** (p.1722)(a + 0.5f)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Integer::MIN_VALUE** (p.1441), the result is equal to the value of **Integer::MIN_VALUE** (p.1441). o If the argument is positive infinity or any value greater than or equal to the value of **Integer::MAX_VALUE** (p.1441), the result is equal to the value of **Integer::MAX_VALUE** (p.1441).

Parameters:

value - the value to round

Returns:

the value of the argument rounded to the nearest integral value.

6.346.3.22 static double decaf::lang::Math::signum (double *value*) [static]

Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero. Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the floating-point value whose signum is to be returned

Returns:

the signum function of the argument

6.346.3.23 static float decaf::lang::Math::signum (float *value*) [static]

Returns Euler's number e raised to the power of a double value. Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is positive zero.

Parameters:

value - the exponent to raise e to

Returns:

the value e^a , where e is the base of the natural logarithms. Returns $e^x - 1$. Note that for values of x near 0, the exact sum of $\expm1(x) + 1$ is much closer to the true result of e^x than $\exp(x)$. Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is -1.0. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to raise $e^x - 1$

Returns:

the value $e^x - 1$. Returns $\sqrt{x^2 + y^2}$ without intermediate overflow or underflow. Special cases:

If either argument is infinite, then the result is positive infinity. If either argument is NaN and neither argument is infinite, then the result is NaN.

Parameters:

x - an argument

y - another argument

Returns:

the $\sqrt{x^2 + y^2}$ without intermediate overflow or underflow Returns the signum function of the argument; zero if the argument is zero, 1.0 if the argument is greater than zero, -1.0 if the argument is less than zero. Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the floating-point value whose signum is to be returned

Returns:

the signum function of the argument

6.346.3.24 static double decaf::lang::Math::sqrt (double *value*) [static]

Returns the arc cosine of an angle, in the range of 0.0 through pi. Special case:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc cosine of value in radians. Returns the arc sine of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc cosine of value in radians. Returns the arc tangent of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc tangent of value in radians. Converts rectangular coordinates (x, y) to polar (r, theta). This method computes the phase theta by computing an arc tangent of y/x in the range of -pi to pi. Special cases:

o If either argument is NaN, then the result is NaN. o If the first argument is positive zero and the second argument is positive, or the first argument is positive and finite and the second argument is positive infinity, then the result is positive zero. o If the first argument is negative zero and the second argument is positive, or the first argument is negative and finite and the second argument is positive infinity, then the result is negative zero. o If the first argument is positive zero and the second argument is negative, or the first argument is positive and finite and the second argument is negative infinity, then the result is the double value closest to pi. o If the first argument is negative zero and the second argument is negative, or the first argument is negative and finite and the second argument is negative infinity, then the result is the double value closest to -pi. o If the first argument is positive and the second argument is positive zero or negative zero, or the first argument is positive infinity and the second argument is finite, then the result is the double value closest to pi/2. o If the first argument is negative and the second argument is positive zero or negative zero, or the first argument is negative infinity and the second argument is finite, then the result is the double value closest to -pi/2. o If both arguments are positive infinity, then the result is the double value closest to pi/4. o If the first argument is positive infinity and the second argument is negative infinity, then the result is the double value closest to 3*pi/4. o If the first argument is negative infinity and the second argument is positive infinity, then the result is the double value closest to -pi/4. o If both arguments are negative infinity, then the result is the double value closest to -3*pi/4.

Parameters:

y - the ordinate coordinate
x - the abscissa coordinate

Returns:

the theta component of the point (r, theta) in polar coordinates that corresponds to the point (x, y) in Cartesian coordinates. Returns the cube root of a double value. For positive finite x, cbrt(-x) == -cbrt(x); that is, the cube root of a negative value is the negative of the cube root of that value's magnitude. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the double to compute the cube root of

Returns:

the cube root of value Returns the trigonometric cosine of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN.

Parameters:

value - an value in radians

Returns:

the cosine of the argument. Returns the hyperbolic cosine of a double value. The hyperbolic cosine of x is defined to be $(e^x + e^{-x})/2$ where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is positive infinity. o If the argument is zero, then the result is 1.0.

Parameters:

value - the number whose hyperbolic cosine is to be found

Returns:

the hyperbolic cosine of value Returns the trigonometric sine of an angle. Special case:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose sin is to be found

Returns:

the sine of value Returns the hyperbolic sine of a double value. The hyperbolic sine of x is defined to be $(e^x - e^{-x})/2$ where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose hyperbolic sin is to be found

Returns:

the hyperbolic sine of value Returns the trigonometric tangent of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose tangent is to be found

Returns:

the tangent of value Returns the hyperbolic tangent of a double value. The hyperbolic tangent of x is defined to be $(e^x - e^{-x})/(e^x + e^{-x})$, in other words, $\sinh(x)/\cosh(x)$. Note that the absolute value of the exact tanh is always less than 1. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument. o If the argument is positive infinity, then the result is +1.0. o If the argument is negative infinity, then the result is -1.0.

Parameters:

value - the number whose hyperbolic tangent is to be found

Returns:

the hyperbolic cosine of value Returns the correctly rounded positive square root of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Otherwise, the result is the double value closest to the true mathematical square root of the argument value.

Parameters:

value - the value to find the square root of
the square root of the argument.

6.346.3.25 `static double decaf::lang::Math::toDegrees (double angrad)` [inline, static]

Returns the measure in degrees of the supplied radian angle.

Parameters:

angrad - an angle in radians

Returns:

the degree measure of the angle.

6.346.3.26 `static double decaf::lang::Math::toRadians (double angdeg)` [inline, static]

Returns the measure in radians of the supplied degree angle.

Parameters:

angdeg - an angle in degrees

Returns:

the radian measure of the angle.

6.346.4 Field Documentation

6.346.4.1 `const double decaf::lang::Math::E` [static]

6.346.4.2 `const double decaf::lang::Math::PI` [static]

Sets the current usage amount.
- unsigned long long **getLimit** () const
Gets the current limit amount.
- void **setLimit** (unsigned long long limit)
Sets the current limit amount.

6.347.1 Constructor & Destructor Documentation

6.347.1.1 `activemq::util::MemoryUsage::MemoryUsage ()`

Default Constructor.

6.347.1.2 `activemq::util::MemoryUsage::MemoryUsage (unsigned long long limit)`

Creates an instance of an **Usage** (p. 2681) monitor with a set limit.

Parameters:

limit - amount of memory this manager allows.

6.347.1.3 `virtual activemq::util::MemoryUsage::~~MemoryUsage ()` [virtual]

6.347.2 Member Function Documentation

6.347.2.1 `virtual void activemq::util::MemoryUsage::decreaseUsage (unsigned long long value)` [virtual]

Decreases the usage by the value amount.

Parameters:

value Amount of space to return to the pool

Implements **activemq::util::Usage** (p. 2681).

6.347.2.2 `virtual void activemq::util::MemoryUsage::enqueueUsage (unsigned long long value)` [inline, virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters:

value Amount of usage in bytes to add.

Implements **activemq::util::Usage** (p. 2681).

6.347.2.3 `unsigned long long activemq::util::MemoryUsage::getLimit ()` const [inline]

Gets the current limit amount.

Returns:

the amount that can be used before full.

6.347.2.4 `unsigned long long activemq::util::MemoryUsage::getUsage () const [inline]`

Gets the current usage amount.

Returns:

the amount of bytes currently used.

6.347.2.5 `virtual void activemq::util::MemoryUsage::increaseUsage (unsigned long long value) [virtual]`

Increases the usage by the value amount.

Parameters:

value Amount of usage to add.

Implements `activemq::util::Usage` (p. 2682).

6.347.2.6 `virtual bool activemq::util::MemoryUsage::isFull () const [virtual]`

Returns true if this `Usage` (p. 2681) instance is full, i.e. `Usage` (p. 2681) $\geq 100\%$

Implements `activemq::util::Usage` (p. 2682).

6.347.2.7 `void activemq::util::MemoryUsage::setLimit (unsigned long long limit) [inline]`

Sets the current limit amount.

Parameters:

limit - The amount that can be used before full.

6.347.2.8 `void activemq::util::MemoryUsage::setUsage (unsigned long long usage) [inline]`

Sets the current usage amount.

Parameters:

usage - The amount to tag as used.

6.347.2.9 `virtual void activemq::util::MemoryUsage::waitForSpace (unsigned int timeout) [virtual]`

Waits for more space to be returned to this `Usage` (p. 2681) Manager, times out when the given time span in milliseconds elapses.

Parameters:

timeout The time to wait for more space.

Implements `activemq::util::Usage` (p. 2682).

6.347.2.10 `virtual void activemq::util::MemoryUsage::waitForSpace ()` [virtual]

Waits forever for more space to be returned to this **Usage** (p. 2681) Manager.

Implements **activemq::util::Usage** (p. 2682).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/MemoryUsage.h`

6.348 activemq::commands::Message Class Reference

#include <src/main/activemq/commands/Message.h> Inheritance diagram for activemq::commands::Message:

Public Member Functions

- **Message** ()
- virtual **~Message** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **Message * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.
- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual bool **isMarshalAware** () const
Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual void **setAckHandler** (**core::ActiveMQAckHandler** *handler)
*Sets the Acknowledgment Handler that this **Message** (p. 1737) will use when the Acknowledge method is called.*
- virtual **core::ActiveMQAckHandler * getAckHandler** () const
*Gets the Acknowledgment Handler that this **Message** (p. 1737) will use when the Acknowledge method is called.*
- virtual unsigned int **getSize** () const
Returns the Size of this message in Bytes.

- virtual bool **isExpired** () const
Returns if this message has expired, meaning that its Expiration time has elapsed.
- **util::PrimitiveMap & getMessageProperties** ()
Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.
- const **util::PrimitiveMap & getMessageProperties** () const
- bool **isReadOnlyProperties** () const
*Returns if the **Message** (p. 1737) Properties Are Read Only.*
- void **setReadOnlyProperties** (bool value)
*Set the Read Only State of the **Message** (p. 1737) Properties.*
- bool **isReadOnlyBody** () const
*Returns if the **Message** (p. 1737) Body is Read Only.*
- void **setReadOnlyBody** (bool value)
*Set the Read Only State of the **Message** (p. 1737) Content.*

6.348.1 Constructor & Destructor Documentation

6.348.1.1 `activemq::commands::Message::Message (const Message &) [inline, protected]`

6.348.1.2 `activemq::commands::Message::Message ()`

6.348.1.3 `virtual activemq::commands::Message::~~Message () [virtual]`

6.348.2 Member Function Documentation

6.348.2.1 `virtual void activemq::commands::Message::afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException) [virtual]`

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p. 558).

6.348.2.2 `virtual void activemq::commands::Message::beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException) [virtual]`

Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

Parameters:

wireFormat - the **wireformat** (p. 74) controller

Reimplemented from **activemq::commands::BaseDataStructure** (p. 558).

6.348.2.3 `virtual Message* activemq::commands::Message::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 147), **activemq::commands::ActiveMQBytesMessage** (p. 166),

activemq::commands::ActiveMQMapMessage (p. 258), **activemq::commands::ActiveMQMessage** (p. 280), **activemq::commands::ActiveMQObjectMessage** (p. 311), **activemq::commands::ActiveMQStreamMessage** (p. 377), and **activemq::commands::ActiveMQTextMessage** (p. 450).

6.348.2.4 **virtual void activemq::commands::Message::copyDataStructure (const DataStructure * *src*) [virtual]**

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 147), **activemq::commands::ActiveMQBytesMessage** (p. 167), **activemq::commands::ActiveMQMapMessage** (p. 258), **activemq::commands::ActiveMQMessage** (p. 280), **activemq::commands::ActiveMQObjectMessage** (p. 311), **activemq::commands::ActiveMQStreamMessage** (p. 377), and **activemq::commands::ActiveMQTextMessage** (p. 450).

6.348.2.5 **virtual bool activemq::commands::Message::equals (const DataStructure * *value*) const [virtual]**

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 148), **activemq::commands::ActiveMQBytesMessage** (p. 167), **activemq::commands::ActiveMQMapMessage** (p. 259), **activemq::commands::ActiveMQMessage** (p. 280), **activemq::commands::ActiveMQObjectMessage** (p. 311), **activemq::commands::ActiveMQStreamMessage** (p. 377), and **activemq::commands::ActiveMQTextMessage** (p. 450).

6.348.2.6 **virtual core::ActiveMQAckHandler* activemq::commands::Message::getAckHandler () const [inline, virtual]**

Gets the Acknowledgment Handler that this **Message** (p. 1737) will use when the Acknowledge method is called.

Returns:

handler ActiveMQAckHandler to call or NULL if not set

- 6.348.2.7 `virtual long long activemq::commands::Message::getArrival () const [virtual]`
- 6.348.2.8 `virtual long long activemq::commands::Message::getBrokerInTime () const [virtual]`
- 6.348.2.9 `virtual long long activemq::commands::Message::getBrokerOutTime () const [virtual]`
- 6.348.2.10 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () [virtual]`
- 6.348.2.11 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () const [virtual]`
- 6.348.2.12 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () [virtual]`
- 6.348.2.13 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () const [virtual]`
- 6.348.2.14 `virtual std::vector<unsigned char>& activemq::commands::Message::getContent () [virtual]`
- 6.348.2.15 `virtual const std::vector<unsigned char>& activemq::commands::Message::getContent () const [virtual]`
- 6.348.2.16 `virtual std::string& activemq::commands::Message::getCorrelationId () [virtual]`
- 6.348.2.17 `virtual const std::string& activemq::commands::Message::getCorrelationId () const [virtual]`
- 6.348.2.18 `virtual Pointer<DataStructure>& activemq::commands::Message::getDataStructure () [virtual]`
- 6.348.2.19 `virtual const Pointer<DataStructure>& activemq::commands::Message::getDataStructure () const [virtual]`
- 6.348.2.20 `virtual unsigned char activemq::commands::Message::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

Reimplemented in `activemq::commands::ActiveMQBlobMessage` (p. 148), `activemq::commands::ActiveMQBytesMessage` (p. 168), `activemq::commands::ActiveMQMapMessage` (p. 260), `activemq::commands::ActiveMQMessage` (p. 280), `activemq::commands::ActiveMQObjectMessage` (p. 312), `activemq::commands::ActiveMQStreamMessage` (p. 377), and `activemq::commands::ActiveMQTextMessage` (p. 451).

- 6.348.2.21** `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () [virtual]`
- 6.348.2.22** `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () const [virtual]`
- 6.348.2.23** `virtual long long activemq::commands::Message::getExpiration () const [virtual]`
- 6.348.2.24** `virtual std::string& activemq::commands::Message::getGroupID () [virtual]`
- 6.348.2.25** `virtual const std::string& activemq::commands::Message::getGroupID () const [virtual]`
- 6.348.2.26** `virtual int activemq::commands::Message::getGroupSequence () const [virtual]`
- 6.348.2.27** `virtual std::vector<unsigned char>& activemq::commands::Message::getMarshaledProperties () [virtual]`
- 6.348.2.28** `virtual const std::vector<unsigned char>& activemq::commands::Message::getMarshaledProperties () const [virtual]`
- 6.348.2.29** `virtual Pointer<MessageId>& activemq::commands::Message::getMessageId () [virtual]`
- 6.348.2.30** `virtual const Pointer<MessageId>& activemq::commands::Message::getMessageId () const [virtual]`
- 6.348.2.31** `const util::PrimitiveMap& activemq::commands::Message::getMessageProperties () const [inline]`
- 6.348.2.32** `util::PrimitiveMap& activemq::commands::Message::getMessageProperties () [inline]`

Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.

Returns:

a reference to the Primitive Map that holds message properties.

- 6.348.2.33** `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination ()`
[virtual]
- 6.348.2.34** `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () const`
[virtual]
- 6.348.2.35** `virtual Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId ()`

[virtual]
- 6.348.2.37** `virtual unsigned char activemq::commands::Message::getPriority ()`
const [virtual]
- 6.348.2.38** `virtual Pointer<ProducerId>& activemq::commands::Message::getProducerId ()`
[virtual]
- 6.348.2.39** `virtual const Pointer<ProducerId>& activemq::commands::Message::getProducerId () const`
[virtual]
- 6.348.2.40** `virtual int activemq::commands::Message::getRedeliveryCounter ()`
const [virtual]
- 6.348.2.41** `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo ()` [virtual]
- 6.348.2.42** `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () const` [virtual]
- 6.348.2.43** `virtual unsigned int activemq::commands::Message::getSize () const`
[virtual]

Returns the Size of this message in Bytes.

Returns:

number of bytes this message equates to.

- 6.348.2.44** `virtual Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId ()`
[virtual]
- 6.348.2.45** `virtual const Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId ()`
const [virtual]
- 6.348.2.46** `virtual long long activemq::commands::Message::getTimestamp () const`
[virtual]
- 6.348.2.47** `virtual Pointer<TransactionId>& activemq::commands::Message::getTransactionId ()`
[virtual]
- 6.348.2.48** `virtual const Pointer<TransactionId>& activemq::commands::Message::getTransactionId () const`
[virtual]
- 6.348.2.49** `virtual std::string& activemq::commands::Message::getType ()`
[virtual]
- 6.348.2.50** `virtual const std::string& activemq::commands::Message::getType ()`
const [virtual]
- 6.348.2.51** `virtual std::string& activemq::commands::Message::getUserID ()`
[virtual]
- 6.348.2.52** `virtual const std::string& activemq::commands::Message::getUserID ()`
const [virtual]
- 6.348.2.53** `virtual bool activemq::commands::Message::isCompressed () const`
[virtual]
- 6.348.2.54** `virtual bool activemq::commands::Message::isDroppable () const`
[virtual]
- 6.348.2.55** `virtual bool activemq::commands::Message::isExpired () const` [inline,
virtual]

Returns if this message has expired, meaning that its Expiration time has elapsed.

Returns:

true if message is expired.

References `decaf::util::Date::getCurrentTimeMilliseconds()`.

- 6.348.2.56** `virtual bool activemq::commands::Message::isMarshalAware () const`
[inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns:

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 559).

Reimplemented in **activemq::commands::ActiveMQMapMessage** (p. 262), and **activemq::commands::ActiveMQStreamMessage** (p. 378).

6.348.2.57 `virtual bool activemq::commands::Message::isMessage () const`
[inline, virtual]

Returns:

an answer of true to the **isMessage()** (p. 1747) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 510).

6.348.2.58 `virtual bool activemq::commands::Message::isPersistent () const`
[virtual]

6.348.2.59 `bool activemq::commands::Message::isReadOnlyBody () const` [inline]

Returns if the **Message** (p. 1737) Body is Read Only.

Returns:

true if **Message** (p. 1737) Content is Read Only.

6.348.2.60 `bool activemq::commands::Message::isReadOnlyProperties () const`
[inline]

Returns if the **Message** (p. 1737) Properties Are Read Only.

Returns:

true if **Message** (p. 1737) Properties are Read Only.

6.348.2.61 `virtual bool activemq::commands::Message::isRecievedByDFBridge ()`
`const` [virtual]

6.348.2.62 `Message& activemq::commands::Message::operator= (const Message &)`
[inline, protected]

6.348.2.63 `virtual void activemq::commands::Message::setAckHandler`
`(core::ActiveMQAckHandler * handler)` [inline, virtual]

Sets the Acknowledgment Handler that this **Message** (p. 1737) will use when the Acknowledge method is called.

Parameters:

handler ActiveMQAckHandler to call

- 6.348.2.64 virtual void activemq::commands::Message::setArrival (long long *arrival*) [virtual]
- 6.348.2.65 virtual void activemq::commands::Message::setBrokerInTime (long long *brokerInTime*) [virtual]
- 6.348.2.66 virtual void activemq::commands::Message::setBrokerOutTime (long long *brokerOutTime*) [virtual]

- 6.348.2.73 virtual void activemq::commands::Message::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.348.2.74 virtual void activemq::commands::Message::setDroppable (bool *droppable*) [virtual]
- 6.348.2.75 virtual void activemq::commands::Message::setExpiration (long long *expiration*) [virtual]
- 6.348.2.76 virtual void activemq::commands::Message::setGroupID (const std::string & *groupID*) [virtual]
- 6.348.2.77 virtual void activemq::commands::Message::setGroupSequence (int *groupSequence*) [virtual]
- 6.348.2.78 virtual void activemq::commands::Message::setMarshaledProperties (const std::vector< unsigned char > & *marshalledProperties*) [virtual]
- 6.348.2.79 virtual void activemq::commands::Message::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]
- 6.348.2.80 virtual void activemq::commands::Message::setOriginalDestination (const Pointer< ActiveMQDestination > & *originalDestination*) [virtual]
- 6.348.2.81 virtual void activemq::commands::Message::setOriginalTransactionId (const Pointer< TransactionId > & *originalTransactionId*) [virtual]

Generated on Sat Apr 17 00:41:34 2010 for activemq-cpp-3.0.1 by Doxygen

- 6.348.2.82 virtual void activemq::commands::Message::setPersistent (bool *persistent*) [virtual]
- 6.348.2.83 virtual void activemq::commands::Message::setPriority (unsigned char *priority*) [virtual]

Parameters:

value - true if Content should be read only.

6.348.2.86 void activemq::commands::Message::setReadOnlyProperties (bool *value*) [inline]

Set the Read Only State of the **Message** (p. 1737) Properties.

Parameters:

value - true if Properties should be read only.

6.348.2.87 virtual void activemq::commands::Message::setRecievedByDFBridge (bool *recievedByDFBridge*) [virtual]

6.348.2.88 virtual void activemq::commands::Message::setRedeliveryCounter (int *redeliveryCounter*) [virtual]

6.348.2.89 virtual void activemq::commands::Message::setReplyTo (const Pointer< ActiveMQDestination > & *replyTo*) [virtual]

6.348.2.90 virtual void activemq::commands::Message::setTargetConsumerId (const Pointer< ConsumerId > & *targetConsumerId*) [virtual]

6.348.2.91 virtual void activemq::commands::Message::setTimestamp (long long *timestamp*) [virtual]

6.348.2.92 virtual void activemq::commands::Message::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.348.2.93 virtual void activemq::commands::Message::setType (const std::string & *type*) [virtual]

6.348.2.94 virtual void activemq::commands::Message::setUserID (const std::string & *userID*) [virtual]

6.348.2.95 virtual std::string activemq::commands::Message::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 150), **activemq::commands::ActiveMQBytesMessage** (p. 173), **activemq::commands::ActiveMQMapMessage** (p. 266), **activemq::commands::ActiveMQMessage** (p. 281), **activemq::commands::ActiveMQObjectMessage** (p. 312), **activemq::commands::ActiveMQStreamMessage** (p. 382), and **activemq::commands::ActiveMQTextMessage** (p. 452).

6.348.2.96 `virtual Pointer<Command> activemq::commands::Message::visit
 (activemq::state::CommandVisitor * visitor) throw (
 exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.349 cms::Message Class Reference

Root of all messages.

#include <src/main/cms/Message.h> Inheritance diagram for cms::Message:

Public Member Functions

- virtual `~Message ()`
- virtual `Message * clone () const =0`
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual void `acknowledge () const =0 throw (CMSEException)`
Acknowledges all consumed messages of the session of this consumed message.
- virtual void `clearBody ()=0 throw (CMSEException)`
Clears out the body of the message.
- virtual void `clearProperties ()=0 throw (CMSEException)`
Clears out the message body.
- virtual `std::vector< std::string > getPropertyNames () const =0 throw (CMSEException)`
Retrieves the property names.
- virtual bool `propertyExists (const std::string &name) const =0 throw (CMSEException)`
Indicates whether or not a given property exists.
- virtual bool `getBooleanProperty (const std::string &name) const =0 throw (CMSEException)`
Gets a boolean property.
- virtual unsigned char `getByteProperty (const std::string &name) const =0 throw (CMSEException)`
Gets a byte property.
- virtual double `getDoubleProperty (const std::string &name) const =0 throw (CMSEException)`
Gets a double property.
- virtual float `getFloatProperty (const std::string &name) const =0 throw (CMSEException)`
Gets a float property.
- virtual int `getIntProperty (const std::string &name) const =0 throw (CMSEException)`
Gets a int property.

- virtual long long **getLongProperty** (const std::string &name) const =0 throw (CMSEception)
Gets a long property.
- virtual short **getShortProperty** (const std::string &name) const =0 throw (CMSEception)
Gets a short property.
- virtual std::string **getStringProperty** (const std::string &name) const =0 throw (CMSEception)
Gets a string property.
- virtual void **setBooleanProperty** (const std::string &name, bool value)=0 throw (CMSEception)
Sets a boolean property.
- virtual void **setByteProperty** (const std::string &name, unsigned char value)=0 throw (CMSEception)
Sets a byte property.
- virtual void **setDoubleProperty** (const std::string &name, double value)=0 throw (CMSEception)
Sets a double property.
- virtual void **setFloatProperty** (const std::string &name, float value)=0 throw (CMSEception)
Sets a float property.
- virtual void **setIntProperty** (const std::string &name, int value)=0 throw (CMSEception)
Sets a int property.
- virtual void **setLongProperty** (const std::string &name, long long value)=0 throw (CMSEception)
Sets a long property.
- virtual void **setShortProperty** (const std::string &name, short value)=0 throw (CMSEception)
Sets a short property.
- virtual void **setStringProperty** (const std::string &name, const std::string &value)=0 throw (CMSEception)
Sets a string property.
- virtual std::string **getCMSCorrelationID** () const =0 throw (CMSEception)
Gets the correlation ID for the message.
- virtual void **setCMSCorrelationID** (const std::string &correlationId)=0 throw (CMSEception)
Sets the correlation ID for the message.

- virtual int **getCMSDeliveryMode** () const =0 throw (CMSEException)
*Gets the **DeliveryMode** (p. 1188) for this message.*
- virtual void **setCMSDeliveryMode** (int mode)=0 throw (CMSEException)
*Sets the **DeliveryMode** (p. 1188) for this message.*
- virtual const **Destination** * **getCMSDestination** () const =0 throw (CMSEException)
*Gets the **Destination** (p. 1190) object for this message.*
- virtual void **setCMSDestination** (const **Destination** *destination)=0 throw (CMSEException)
*Sets the **Destination** (p. 1190) object for this message.*
- virtual long long **getCMSExpiration** () const =0 throw (CMSEException)
Gets the message's expiration value.
- virtual void **setCMSExpiration** (long long expireTime)=0 throw (CMSEException)
Sets the message's expiration value.
- virtual std::string **getCMSMessageID** () const =0 throw (CMSEException)
The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.
- virtual void **setCMSMessageID** (const std::string &id)=0 throw (CMSEException)
Sets the message ID.
- virtual int **getCMSPriority** () const =0 throw (CMSEException)
Gets the message priority level.
- virtual void **setCMSPriority** (int priority)=0 throw (CMSEException)
Sets the Priority Value for this message.
- virtual bool **getCMSRedelivered** () const =0 throw (CMSEException)
Gets an indication of whether this message is being redelivered.
- virtual void **setCMSRedelivered** (bool redelivered)=0 throw (CMSEException)
Specifies whether this message is being redelivered.
- virtual const **cms::Destination** * **getCMSReplyTo** () const =0 throw (CMSEException)
*Gets the **Destination** (p. 1190) object to which a reply to this message should be sent.*
- virtual void **setCMSReplyTo** (const **cms::Destination** *destination)=0 throw (CMSEException)
*Sets the **Destination** (p. 1190) object to which a reply to this message should be sent.*
- virtual long long **getCMSTimestamp** () const =0 throw (CMSEException)
Gets the message timestamp.
- virtual void **setCMSTimestamp** (long long timeStamp)=0 throw (CMSEException)

Sets the message timestamp.

- virtual std::string **getCMSType** () const =0 throw (CMSEException)

Gets the message type identifier supplied by the client when the message was sent.

- virtual void **setCMSType** (const std::string &type)=0 throw (CMSEException)

Sets the message type.

6.349.1 Detailed Description

Root of all messages. As in JMS, a message is comprised of 3 parts: CMS-specific headers, user-defined properties, and the body.

Message (p. 1753) Bodies

The CMS API defines four types of message bodies, each type is contained within its own **Message** (p. 1753) Interface definition.

- Stream - A **StreamMessage** (p. 2476) object's message body contains a stream of primitive values in the C++ language. It is filled and read sequentially. Unlike the **BytesMessage** (p. 759) type the values written to a **StreamMessage** (p. 2476) retain information on their type and rules for type conversion are enforced when reading back the values from the **Message** (p. 1753) Body.
- Map - A **MapMessage** (p. 1701) object's message body contains a set of name-value pairs, where names are std::string objects, and values are C++ primitives. The entries can be accessed sequentially or randomly by name. The **MapMessage** (p. 1701) makes no guarantee on the order of the elements within the **Message** (p. 1753) body.
- Text - A **TextMessage** (p. 2542) object's message body contains a std::string object. This message type can be used to transport plain-text messages, and XML messages.
- Bytes - A **BytesMessage** (p. 759) object's message body contains a stream of uninterpreted bytes. This message type is for literally encoding a body to match an existing message format. In many cases, it is possible to use one of the other body types, which are easier to use.

Message (p. 1753) Properties

Message (p. 1753) properties support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p. 850). The String-to-primitive conversions may throw a runtime exception if the primitive's valueOf method does not accept the String as a valid representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	int	long	float	double	String
boolean	X							X
byte		X	X	X	X			X
short			X	X	X			X
int				X	X			X
long					X			X
float						X	X	X
double							X	X
String	X	X	X	X	X	X	X	X

When a **Message** (p. 1753) is delivered its properties are considered to be in a read-only mode and cannot be changed. Attempting to change the value of a delivered Message's properties will result in a **CMSEException** (p. 850) being thrown.

6.349.2 Constructor & Destructor Documentation

6.349.2.1 `virtual cms::Message::~Message () [inline, virtual]`

6.349.3 Member Function Documentation

6.349.3.1 `virtual void cms::Message::acknowledge () const throw (CMSEException) [pure virtual]`

Acknowledges all consumed messages of the session of this consumed message. All consumed CMS messages support the acknowledge method for use when a client has specified that its CMS session's consumed messages are to be explicitly acknowledged. By invoking acknowledge on a consumed message, a client acknowledges all messages consumed by the session that the message was delivered to.

Calls to acknowledge are ignored for both transacted sessions and sessions specified to use implicit acknowledgment modes.

A client may individually acknowledge each message as it is consumed, or it may choose to acknowledge messages as an application-defined group (which is done by calling acknowledge on the last received message of the group, thereby acknowledging all messages consumed by the session.)

Messages that have been received but not acknowledged may be redelivered.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

IllegalStateException (p. 1399) - if this method is called on a closed session.

Implemented in `activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::Message >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >` (p. 297), and `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >` (p. 297).

6.349.3.2 `virtual void cms::Message::clearBody () throw (CMSEException) [pure virtual]`

Clears out the body of the message. This does not clear the headers or properties.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 166), `activemq::commands::ActiveMQStreamMessage` (p. 376), `activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::Message >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >` (p. 297), `activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >` (p. 297), and `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >` (p. 297).

6.349.3.3 `virtual void cms::Message::clearProperties () throw (CMSEException)` [pure virtual]

Clears out the message body. Clearing a message's body does not clear its header values or property entries.

If this message body was read-only, calling this method leaves the message body in the same state as an empty body in a newly created message.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >` (p. 298), `activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >` (p. 298), `activemq::commands::ActiveMQMessageTemplate< cms::Message >` (p. 298), `activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >` (p. 298), `activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >` (p. 298), and `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >` (p. 298).

6.349.3.4 `virtual Message* cms::Message::clone () const` [pure virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 147), `activemq::commands::ActiveMQBytesMessage` (p. 166), `activemq::commands::ActiveMQMapMessage` (p. 258), `activemq::commands::ActiveMQMessage` (p. 279), `activemq::commands::ActiveMQObjectMessage` (p. 311), `activemq::commands::ActiveMQStreamMessage` (p. 376), `activemq::commands::ActiveMQTextMessage` (p. 450), and `cms::BytesMessage` (p. 762).

6.349.3.5 `virtual bool cms::Message::getBooleanProperty (const std::string & name) const throw (CMSEException)` [pure virtual]

Gets a boolean property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 298), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 298).

6.349.3.6 virtual unsigned char cms::Message::getBytesProperty (const std::string & name) const throw (CMSEException) [pure virtual]

Gets a byte property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 298), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 298).

6.349.3.7 virtual std::string cms::Message::getCMSCorrelationID () const throw (CMSEException) [pure virtual]

Gets the correlation ID for the message. This method is used to return correlation ID values that are either provider-specific message IDs or application-specific String values.

Returns:

string representation of the correlation Id

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 298), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 298), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 298).

6.349.3.8 `virtual int cms::Message::getCMSDeliveryMode () const throw (CMSEException) [pure virtual]`

Gets the **DeliveryMode** (p. 1188) for this message.

Returns:

DeliveryMode (p. 1188) enumerated value.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 299), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 299), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 299), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 299), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 299), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 299).

6.349.3.9 `virtual const Destination* cms::Message::getCMSDestination () const throw (CMSEException) [pure virtual]`

Gets the **Destination** (p. 1190) object for this message. The **CMSDestination** header field contains the destination to which the message is being sent.

When a message is sent, this field is ignored. After completion of the send or publish method, the field holds the destination specified by the method.

When a message is received, its **CMSDestination** value must be equivalent to the value assigned when it was sent.

Returns:

Destination (p. 1190) object

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 299), `activemq::commands::ActiveMQMessageTemplate<`

`cms::MapMessage` > (p. 299), `activemq::commands::ActiveMQMessageTemplate`<
`cms::Message` > (p. 299), `activemq::commands::ActiveMQMessageTemplate`<
`cms::StreamMessage` > (p. 299), `activemq::commands::ActiveMQMessageTemplate`<
`cms::TextMessage` > (p. 299), and `activemq::commands::ActiveMQMessageTemplate`<
`cms::ObjectMessage` > (p. 299).

6.349.3.10 `virtual long long cms::Message::getCMSExpiration () const throw (CMSException) [pure virtual]`

Gets the message's expiration value. When a message is sent, the `CMSExpiration` header field is left unassigned. After completion of the send or publish method, it holds the expiration time of the message. This is the sum of the time-to-live value specified by the client and the GMT at the time of the send or publish.

If the time-to-live is specified as zero, `CMSExpiration` is set to zero to indicate that the message does not expire.

When a message's expiration time is reached, a provider should discard it. The CMS API does not define any form of notification of message expiration.

Clients should not receive messages that have expired; however, the CMS API does not guarantee that this will not happen.

Returns:

the time the message expires, which is the sum of the time-to-live value specified by the client and the GMT at the time of the send

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate`<
`cms::BytesMessage` > (p. 299), `activemq::commands::ActiveMQMessageTemplate`<
`cms::MapMessage` > (p. 299), `activemq::commands::ActiveMQMessageTemplate`<
`cms::Message` > (p. 299), `activemq::commands::ActiveMQMessageTemplate`<
`cms::StreamMessage` > (p. 299), `activemq::commands::ActiveMQMessageTemplate`<
`cms::TextMessage` > (p. 299), and `activemq::commands::ActiveMQMessageTemplate`<
`cms::ObjectMessage` > (p. 299).

6.349.3.11 `virtual std::string cms::Message::getCMSMessageID () const throw (CMSException) [pure virtual]`

The `CMSMessageID` header field contains a value that uniquely identifies each message sent by a provider. When a message is sent, `CMSMessageID` can be ignored. When the send or publish method returns, it contains a provider-assigned value.

A `CMSMessageID` is a String value that should function as a unique key for identifying messages in a historical repository. The exact scope of uniqueness is provider-defined. It should at least cover all messages for a specific installation of a provider, where an installation is some connected set of message routers.

All `CMSMessageID` values must start with the prefix 'ID:'. Uniqueness of message ID values across different providers is not required.

Since message IDs take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the message ID is not used

by an application. By calling the **MessageProducer.setDisableMessageID** (p. 1883) method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value.

Returns:

provider-assigned message id

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented	in	activemq::commands::ActiveMQMessageTemplate<
cms::BytesMessage	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::MapMessage	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::Message	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::StreamMessage	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::TextMessage	> (p. 300), and	activemq::commands::ActiveMQMessageTemplate<
cms::ObjectMessage	> (p. 300).	

6.349.3.12 **virtual int cms::Message::getCMSPriority () const throw (**
CMSEException) [pure virtual]

Gets the message priority level. The CMS API defines ten levels of priority value, with 0 as the lowest priority and 9 as the highest. In addition, clients should consider priorities 0-4 as gradations of normal priority and priorities 5-9 as gradations of expedited priority.

The CMS API does not require that a provider strictly implement priority ordering of messages; however, it should do its best to deliver expedited messages ahead of normal messages.

Returns:

priority value

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented	in	activemq::commands::ActiveMQMessageTemplate<
cms::BytesMessage	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::MapMessage	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::Message	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::StreamMessage	> (p. 300),	activemq::commands::ActiveMQMessageTemplate<
cms::TextMessage	> (p. 300), and	activemq::commands::ActiveMQMessageTemplate<
cms::ObjectMessage	> (p. 300).	

6.349.3.13 **virtual bool cms::Message::getCMSRedelivered () const throw (**
CMSEException) [pure virtual]

Gets an indication of whether this message is being redelivered. If a client receives a message with the CMSRedelivered field set, it is likely, but not guaranteed, that this message was delivered earlier but that its receipt was not acknowledged at that time.

Returns:

true if this message is being redelivered

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 300), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 300).

6.349.3.14 `virtual const cms::Destination* cms::Message::getCMSReplyTo () const throw (CMSEException)` [pure virtual]

Gets the **Destination** (p. 1190) object to which a reply to this message should be sent.

Returns:

Destination (p. 1190) to which to send a response to this message

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 300), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 300), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 300).

6.349.3.15 `virtual long long cms::Message::getCMSTimestamp () const throw (CMSEException)` [pure virtual]

Gets the message timestamp. The `CMSTimestamp` header field contains the time a message was handed off to a provider to be sent. It is not the time the message was actually transmitted, because the actual send may occur later due to transactions or other client-side queuing of messages.

When a message is sent, `CMSTimestamp` is ignored. When the send or publish method returns, it contains a time value somewhere in the interval between the call and the return. The value is in the format of a normal millis time value in the Java programming language.

Since timestamps take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the timestamp is not used by an application. By calling the `MessageProducer.setDisableMessageTimestamp` method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint, the timestamp must be set to its normal value.

Returns:

the message timestamp

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 301), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 301).

6.349.3.16 `virtual std::string cms::Message::getCMSType () const throw (CMSEException) [pure virtual]`

Gets the message type identifier supplied by the client when the message was sent.

Returns:

the message type

See also:

`setCMSType` (p. 1773)

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 301), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 301).

6.349.3.17 `virtual double cms::Message::getDoubleProperty (const std::string & name) const throw (CMSEException) [pure virtual]`

Gets a double property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 301), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 301), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 301).

6.349.3.18 `virtual float cms::Message::getFloatProperty (const std::string & name) const throw (CMSException) [pure virtual]`

Gets a float property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 302), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 302).

6.349.3.19 `virtual int cms::Message::getIntProperty (const std::string & name) const throw (CMSException) [pure virtual]`

Gets a int property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<`
`cms::BytesMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::MapMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::Message >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage >` (p. 302), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage >` (p. 302).

6.349.3.20 `virtual long long cms::Message::getLongProperty (const std::string & name) const throw (CMSEException) [pure virtual]`

Gets a long property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<`
`cms::BytesMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::MapMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::Message >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage >` (p. 302), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage >` (p. 302), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage >` (p. 302).

6.349.3.21 `virtual std::vector<std::string> cms::Message::getPropertyNames () const throw (CMSEException) [pure virtual]`

Retrieves the property names.

Returns:

The complete set of property names currently in this message.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<`
`cms::BytesMessage >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<`
`cms::MapMessage >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<`
`cms::Message >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage >` (p. 303), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage >` (p. 303).

6.349.3.22 virtual short cms::Message::getShortProperty (const std::string & name) const throw (CMSException) [pure virtual]

Gets a short property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 303), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 303).

6.349.3.23 virtual std::string cms::Message::getStringProperty (const std::string & name) const throw (CMSException) [pure virtual]

Gets a string property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException (p. 850) if the property does not exist.

MessageFormatException (p. 1842) - if this type conversion is invalid.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 303), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 303).

6.349.3.24 `virtual bool cms::Message::propertyExists (const std::string & name)
const throw (CMSEException)` [pure virtual]

Indicates whether or not a given property exists.

Parameters:

name The name of the property to look up.

Returns:

True if the property exists in this message.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 303), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 303), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 303).

6.349.3.25 `virtual void cms::Message::setBooleanProperty (const std::string & name, bool value) throw (CMSEException)` [pure virtual]

Sets a boolean property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 304), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 304).

6.349.3.26 `virtual void cms::Message::setByteProperty (const std::string & name, unsigned char value) throw (CMSEException)` [pure virtual]

Sets a byte property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 304), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 304), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 304).

6.349.3.27 virtual void cms::Message::setCMSCorrelationID (const std::string & correlationId) throw (CMSEException) [pure virtual]

Sets the correlation ID for the message. A client can use the CMSCorrelationID header field to link one message with another. A typical use is to link a response message with its request message.

CMSCorrelationID can hold one of the following:

- A provider-specific message ID
- An application-specific String
- A provider-native byte[] value

Since each message sent by a CMS provider is assigned a message ID value, it is convenient to link messages via message ID. All message ID values must start with the 'ID:' prefix.

In some cases, an application (made up of several clients) needs to use an application-specific value for linking messages. For instance, an application may use CMSCorrelationID to hold a value referencing some external information. Application-specified values must not start with the 'ID:' prefix; this is reserved for provider-generated message ID values.

If a provider supports the native concept of correlation ID, a CMS client may need to assign specific CMSCorrelationID values to match those expected by clients that do not use the CMS API. A byte[] value is used for this purpose. CMS providers without native correlation ID values are not required to support byte[] values. The use of a byte[] value for CMSCorrelationID is non-portable.

Parameters:

correlationId The message ID of a message being referred to.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 304), `activemq::commands::ActiveMQMessageTemplate<`

`cms::MapMessage` > (p. 304), `activemq::commands::ActiveMQMessageTemplate<`
`cms::Message` > (p. 304), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage` > (p. 304), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage` > (p. 304), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage` > (p. 304).

6.349.3.28 `virtual void cms::Message::setCMSDeliveryMode (int mode) throw (CMSEException)` [pure virtual]

Sets the **DeliveryMode** (p. 1188) for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

mode **DeliveryMode** (p. 1188) enumerated value.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<`
`cms::BytesMessage` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::MapMessage` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::Message` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage` > (p. 305), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage` > (p. 305).

6.349.3.29 `virtual void cms::Message::setCMSDestination (const Destination * destination) throw (CMSEException)` [pure virtual]

Sets the **Destination** (p. 1190) object for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

destination **Destination** (p. 1190) Object

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<`
`cms::BytesMessage` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::MapMessage` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::Message` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage` > (p. 305), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage` > (p. 305), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage` > (p. 305).

6.349.3.30 virtual void cms::Message::setCMSExpiration (long long *expireTime*) throw (CMSException) [pure virtual]

Sets the message's expiration value. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

expireTime the message's expiration time

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 305), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 305), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 305), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 305), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 305), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 305).

6.349.3.31 virtual void cms::Message::setCMSMessageID (const std::string & *id*) throw (CMSException) [pure virtual]

Sets the message ID. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

id the ID of the message

Exceptions:

CMSException (p. 850) - if an internal error occurs.

6.349.3.32 virtual void cms::Message::setCMSPriority (int *priority*) throw (CMSException) [pure virtual]

Sets the Priority Value for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

priority priority value for this message

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 306), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 306), `activemq::commands::ActiveMQMessageTemplate<`

`cms::Message` > (p. 306), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage` > (p. 306), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage` > (p. 306), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage` > (p. 306).

6.349.3.33 `virtual void cms::Message::setCMSRedelivered (bool redelivered) throw (CMSException)` [pure virtual]

Specifies whether this message is being redelivered. This field is set at the time the message is delivered. This method can be used to change the value for a message that has been received.

Parameters:

redelivered boolean redelivered value

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<`
`cms::BytesMessage` > (p. 306), `activemq::commands::ActiveMQMessageTemplate<`
`cms::MapMessage` > (p. 306), `activemq::commands::ActiveMQMessageTemplate<`
`cms::Message` > (p. 306), `activemq::commands::ActiveMQMessageTemplate<`
`cms::StreamMessage` > (p. 306), `activemq::commands::ActiveMQMessageTemplate<`
`cms::TextMessage` > (p. 306), and `activemq::commands::ActiveMQMessageTemplate<`
`cms::ObjectMessage` > (p. 306).

6.349.3.34 `virtual void cms::Message::setCMSReplyTo (const cms::Destination * destination) throw (CMSException)` [pure virtual]

Sets the **Destination** (p. 1190) object to which a reply to this message should be sent. The CMSReplyTo header field contains the destination where a reply to the current message should be sent. If it is null, no reply is expected. The destination may be either a **Queue** (p. 2157) object or a **Topic** (p. 2571) object.

Messages sent with a null CMSReplyTo value may be a notification of some event, or they may just be some data the sender thinks is of interest.

Messages with a CMSReplyTo value typically expect a response. A response is optional; it is up to the client to decide. These messages are called requests. A message sent in response to a request is called a reply.

In some cases a client may wish to match a request it sent earlier with a reply it has just received. The client can use the CMSCorrelationID header field for this purpose.

Parameters:

destination **Destination** (p. 1190) to which to send a response to this message

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<`
`cms::BytesMessage` > (p. 306), `activemq::commands::ActiveMQMessageTemplate<`

cms::MapMessage > (p. 306), activemq::commands::ActiveMQMessageTemplate<
 cms::Message > (p. 306), activemq::commands::ActiveMQMessageTemplate<
 cms::StreamMessage > (p. 306), activemq::commands::ActiveMQMessageTemplate<
 cms::TextMessage > (p. 306), and activemq::commands::ActiveMQMessageTemplate<
 cms::ObjectMessage > (p. 306).

6.349.3.35 virtual void cms::Message::setCMSTimestamp (long long *timeStamp*) throw (CMSEException) [pure virtual]

Sets the message timestamp. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

timeStamp integer time stamp value

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in activemq::commands::ActiveMQMessageTemplate<
 cms::BytesMessage > (p. 307), activemq::commands::ActiveMQMessageTemplate<
 cms::MapMessage > (p. 307), activemq::commands::ActiveMQMessageTemplate<
 cms::Message > (p. 307), activemq::commands::ActiveMQMessageTemplate<
 cms::StreamMessage > (p. 307), activemq::commands::ActiveMQMessageTemplate<
 cms::TextMessage > (p. 307), and activemq::commands::ActiveMQMessageTemplate<
 cms::ObjectMessage > (p. 307).

6.349.3.36 virtual void cms::Message::setCMSType (const std::string & *type*) throw (CMSEException) [pure virtual]

Sets the message type. Some CMS providers use a message repository that contains the definitions of messages sent by applications. The CMSType header field may reference a message's definition in the provider's repository.

The CMS API does not define a standard message definition repository, nor does it define a naming policy for the definitions it contains.

Some messaging systems require that a message type definition for each application message be created and that each message specify its type. In order to work with such CMS providers, CMS clients should assign a value to CMSType, whether the application makes use of it or not. This ensures that the field is properly set for those providers that require it.

To ensure portability, CMS clients should use symbolic values for CMSType that can be configured at installation time to the values defined in the current provider's message repository. If string literals are used, they may not be valid type names for some CMS providers.

Parameters:

type the message type

See also:

getCMSType (p. 1764)

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 307), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 307).

6.349.3.37 `virtual void cms::Message::setDoubleProperty (const std::string & name, double value) throw (CMSEException)` [pure virtual]

Sets a double property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 307), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 307).

6.349.3.38 `virtual void cms::Message::setFloatProperty (const std::string & name, float value) throw (CMSEException)` [pure virtual]

Sets a float property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 307), `activemq::commands::ActiveMQMessageTemplate<`

cms::Message > (p. 307), **activemq::commands::ActiveMQMessageTemplate**<
cms::StreamMessage > (p. 307), **activemq::commands::ActiveMQMessageTemplate**<
cms::TextMessage > (p. 307), and **activemq::commands::ActiveMQMessageTemplate**<
cms::ObjectMessage > (p. 307).

6.349.3.39 `virtual void cms::Message::setIntProperty (const std::string & name, int value) throw (CMSException)` [pure virtual]

Sets a int property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate**<
cms::BytesMessage > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::MapMessage > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::Message > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::StreamMessage > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::TextMessage > (p. 308), and **activemq::commands::ActiveMQMessageTemplate**<
cms::ObjectMessage > (p. 308).

6.349.3.40 `virtual void cms::Message::setLongProperty (const std::string & name, long long value) throw (CMSException)` [pure virtual]

Sets a long property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate**<
cms::BytesMessage > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::MapMessage > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::Message > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::StreamMessage > (p. 308), **activemq::commands::ActiveMQMessageTemplate**<
cms::TextMessage > (p. 308), and **activemq::commands::ActiveMQMessageTemplate**<
cms::ObjectMessage > (p. 308).

6.349.3.41 `virtual void cms::Message::setShortProperty (const std::string & name, short value) throw (CMSEException)` [pure virtual]

Sets a short property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 308), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 308), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 308), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 308), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 308), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 308).

6.349.3.42 `virtual void cms::Message::setStringProperty (const std::string & name, const std::string & value) throw (CMSEException)` [pure virtual]

Sets a string property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException (p. 850) - if the name is an empty string.

MessageNotWriteableException (p. 1877) - if properties are read-only

Implemented in `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >` (p. 309), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >` (p. 309), `activemq::commands::ActiveMQMessageTemplate<cms::Message >` (p. 309), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >` (p. 309), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >` (p. 309), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >` (p. 309).

The documentation for this class was generated from the following file:

6.350 activemq::commands::MessageAck Class Reference

#include <src/main/activemq/commands/MessageAck.h> Inheritance diagram for activemq::commands::MessageAck:

Public Member Functions

- **MessageAck** ()
- virtual **~MessageAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **MessageAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()

6.350.1 Constructor & Destructor Documentation

6.350.1.1 **activemq::commands::MessageAck::MessageAck** (const MessageAck &)
[inline, protected]

6.350.1.2 **activemq::commands::MessageAck::MessageAck** ()

6.350.1.3 **virtual activemq::commands::MessageAck::~~MessageAck** () [virtual]

6.350.2 Member Function Documentation

6.350.2.1 **virtual MessageAck* activemq::commands::MessageAck::cloneDataStructure** ()
const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

6.350.2.2 **virtual void activemq::commands::MessageAck::copyDataStructure**
(const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.350.2.3 virtual bool activemq::commands::MessageAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.350.2.4 virtual unsigned char activemq::commands::MessageAck::getAckType () const [virtual]

6.350.2.5 virtual Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () [virtual]

6.350.2.6 virtual const Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () const [virtual]

6.350.2.7 virtual unsigned char activemq::commands::MessageAck::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.350.2.8** `virtual Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination ()`
[virtual]
- 6.350.2.9** `virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () const` [virtual]
- 6.350.2.10** `virtual Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId ()`
[virtual]
- 6.350.2.11** `virtual const Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId ()`
`const` [virtual]
- 6.350.2.12** `virtual Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId ()`
[virtual]
- 6.350.2.13** `virtual const Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId ()`
`const` [virtual]
- 6.350.2.14** `virtual int activemq::commands::MessageAck::getMessageCount () const`
[virtual]
- 6.350.2.15** `virtual Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId ()`
[virtual]
- 6.350.2.16** `virtual const Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () const`
[virtual]
- 6.350.2.17** `virtual bool activemq::commands::MessageAck::isMessageAck () const`
[inline, virtual]

Returns:

an answer of true to the `isMessageAck()` (p. 1780) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 510).

- 6.350.2.18 `MessageAck& activemq::commands::MessageAck::operator= (const MessageAck &) [inline, protected]`
- 6.350.2.19 `virtual void activemq::commands::MessageAck::setAckType (unsigned char ackType) [virtual]`
- 6.350.2.20 `virtual void activemq::commands::MessageAck::setConsumerId (const Pointer< ConsumerId > & consumerId) [virtual]`
- 6.350.2.21 `virtual void activemq::commands::MessageAck::setDestination (const Pointer< ActiveMQDestination > & destination) [virtual]`
- 6.350.2.22 `virtual void activemq::commands::MessageAck::setFirstMessageId (const Pointer< MessageId > & firstMessageId) [virtual]`
- 6.350.2.23 `virtual void activemq::commands::MessageAck::setLastMessageId (const Pointer< MessageId > & lastMessageId) [virtual]`
- 6.350.2.24 `virtual void activemq::commands::MessageAck::setMessageCount (int messageCount) [virtual]`
- 6.350.2.25 `virtual void activemq::commands::MessageAck::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`
- 6.350.2.26 `virtual std::string activemq::commands::MessageAck::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p.512).

- 6.350.2.27 `virtual Pointer<Command> activemq::commands::MessageAck::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p.2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.883).

6.350.3 Field Documentation

6.351.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p.1783). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.351.2 Constructor & Destructor Documentation

6.351.2.1 `activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::MessageAckMarshaller()` [inline]

6.351.2.2 `virtual activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::~~MessageAckMarshaller()` [inline, virtual]

6.351.3 Member Function Documentation

6.351.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.351.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.351.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.351.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.351.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.351.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.351.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

6.352.3 Member Function Documentation

6.352.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.352.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.352.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.352.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.352.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.352.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.352.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

6.353.3 Member Function Documentation

6.353.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.353.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.353.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.353.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.353.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.353.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.353.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

6.354 cms::MessageConsumer Class Reference

A client uses a `MessageConsumer` (p. 1795) to received messages from a destination.

```
#include <src/main/cms/MessageConsumer.h> Inheritance diagram for cms::MessageConsumer:
```

Public Member Functions

- virtual `~MessageConsumer ()`
- virtual `Message * receive ()=0 throw (CMSEException)`
*Synchronously Receive a **Message** (p. 1753).*
- virtual `Message * receive (int millisecs)=0 throw (CMSEException)`
*Synchronously Receive a **Message** (p. 1753), time out after defined interval.*
- virtual `Message * receiveNoWait ()=0 throw (CMSEException)`
*Receive a **Message** (p. 1753), does not wait if there isn't a new message to read, returns **NULL** if nothing read.*
- virtual void `setMessageListener (MessageListener *listener)=0 throw (CMSEException)`
*Sets the **MessageListener** (p. 1860) that this class will send notifys on.*
- virtual `MessageListener * getMessageListener () const =0 throw (CMSEException)`
*Gets the **MessageListener** (p. 1860) that this class will send new **Message** (p. 1753) notification events to.*
- virtual std::string `getMessageSelector () const =0 throw (cms::CMSEException)`
Gets this message consumer's message selector expression.

6.354.1 Detailed Description

A client uses a `MessageConsumer` (p. 1795) to received messages from a destination. A client may either synchronously receive a message consumer's messages or have the consumer asynchronously deliver them as they arrive.

For synchronous receipt, a client can request the next message from a message consumer using one of its `receive` methods. There are several variations of `receive` that allow a client to poll or wait for the next message.

For asynchronous delivery, a client can register a `MessageListener` (p. 1860) object with a message consumer. As messages arrive at the message consumer, it delivers them by calling the `MessageListener` (p. 1860)'s `onMessage` method.

When the `MessageConsumer`'s close method is called the method can block while an asynchronous message delivery is in progress or until a `receive` operation completes. A blocked consumer in a `receive` call will return a Null when the close method is called.

See also:

`MessageListener` (p. 1860)

Since:

1.0

6.354.2 Constructor & Destructor Documentation

6.354.2.1 `virtual cms::MessageConsumer::~~MessageConsumer () [inline, virtual]`

6.354.3 Member Function Documentation

6.354.3.1 `virtual MessageListener* cms::MessageConsumer::getMessageListener () const throw (CMSEException) [pure virtual]`

Gets the `MessageListener` (p. 1860) that this class will send new `Message` (p. 1753) notification events to.

Returns:

The listener of messages received by this consumer

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 774), and `activemq::core::ActiveMQConsumer` (p. 224).

6.354.3.2 `virtual std::string cms::MessageConsumer::getMessageSelector () const throw (cms::CMSEException) [pure virtual]`

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 774), and `activemq::core::ActiveMQConsumer` (p. 224).

6.354.3.3 `virtual Message* cms::MessageConsumer::receive (int millisecs) throw (CMSEException) [pure virtual]`

Synchronously Receive a `Message` (p.1753), time out after defined interval. Returns null if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 774), and `activemq::core::ActiveMQConsumer` (p. 224).

6.354.3.4 `virtual Message* cms::MessageConsumer::receive () throw (CMSEException)` [pure virtual]

Synchronously Receive a **Message** (p. 1753).

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 775), and `activemq::core::ActiveMQConsumer` (p. 225).

6.354.3.5 `virtual Message* cms::MessageConsumer::receiveNoWait () throw (CMSEException)` [pure virtual]

Receive a **Message** (p. 1753), does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 775), and `activemq::core::ActiveMQConsumer` (p. 225).

6.354.3.6 `virtual void cms::MessageConsumer::setMessageListener (MessageListener * listener) throw (CMSEException)` [pure virtual]

Sets the **MessageListener** (p. 1860) that this class will send notifs on.

Parameters:

listener The listener of messages received by this consumer.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 775), and `activemq::core::ActiveMQConsumer` (p. 226).

The documentation for this class was generated from the following file:

- `src/main/cms/MessageConsumer.h`

6.355 activemq::cmsutil::MessageCreator Class Reference

Creates the user-defined message to be sent by the CmsTemplate (p. 858).

```
#include <src/main/activemq/cmsutil/MessageCreator.h>
```

Public Member Functions

- virtual `~MessageCreator()`
- virtual `cms::Message * createMessage (cms::Session *session)=0` throw (`cms::CMSEException`)

Creates a message from the given session.

6.355.1 Detailed Description

Creates the user-defined message to be sent by the CmsTemplate (p. 858).

6.355.2 Constructor & Destructor Documentation

- 6.355.2.1** virtual `activemq::cmsutil::MessageCreator::~MessageCreator()`
[inline, virtual]

6.355.3 Member Function Documentation

- 6.355.3.1** virtual `cms::Message* activemq::cmsutil::MessageCreator::createMessage (cms::Session * session)` throw (`cms::CMSEException`) [pure virtual]

Creates a message from the given session.

Parameters:

session the CMS Session

Exceptions:

cms::CMSEException (p. 850) if thrown by CMS API methods

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/MessageCreator.h`

6.356 activemq::commands::MessageDispatch Class Reference

#include <src/main/activemq/commands/MessageDispatch.h> Inheritance diagram for activemq::commands::MessageDispatch:

Public Member Functions

- **MessageDispatch** ()
- virtual **~MessageDispatch** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **MessageDispatch** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ConsumerId** > & **getConsumerId** () const
- virtual **Pointer**< **ConsumerId** > **getConsumerId** ()
- virtual void **setConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual const **Pointer**< **Message** > & **getMessage** () const
- virtual **Pointer**< **Message** > & **getMessage** ()
- virtual void **setMessage** (const **Pointer**< **Message** > &message)
- virtual int **getRedeliveryCounter** () const
- virtual void **setRedeliveryCounter** (int redeliveryCounter)
- virtual bool **isMessageDispatch** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_MESSAGE_DISPATCH** = 21

Protected Member Functions

6.356.1 Constructor & Destructor Documentation

- 6.356.1.1** **activemq::commands::MessageDispatch::MessageDispatch** (const **MessageDispatch** &) [inline, protected]
- 6.356.1.2** **activemq::commands::MessageDispatch::MessageDispatch** ()
- 6.356.1.3** **virtual activemq::commands::MessageDispatch::~~MessageDispatch** () [virtual]

6.356.2 Member Function Documentation

- 6.356.2.1** **virtual MessageDispatch* activemq::commands::MessageDispatch::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

- 6.356.2.2** **virtual void activemq::commands::MessageDispatch::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.356.2.3 `virtual bool activemq::commands::MessageDispatch::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.356.2.4 `virtual Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId ()` [virtual]

6.356.2.5 `virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () const` [virtual]

6.356.2.6 `virtual unsigned char activemq::commands::MessageDispatch::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.356.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () [virtual]
- 6.356.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () const [virtual]
- 6.356.2.9 virtual Pointer<Message>& activemq::commands::MessageDispatch::getMessage () [virtual]
- 6.356.2.10 virtual const Pointer<Message>& activemq::commands::MessageDispatch::getMessage () const [virtual]
- 6.356.2.11 virtual int activemq::commands::MessageDispatch::getRedeliveryCounter () const [virtual]
- 6.356.2.12 virtual bool activemq::commands::MessageDispatch::isMessageDispatch () const [inline, virtual]

Returns:

an answer of true to the `isMessageDispatch()` (p.1803) query.

Reimplemented from `activemq::commands::BaseCommand` (p.510).

- 6.356.2.13 MessageDispatch& activemq::commands::MessageDispatch::operator= (const MessageDispatch &) [inline, protected]
- 6.356.2.14 virtual void activemq::commands::MessageDispatch::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]
- 6.356.2.15 virtual void activemq::commands::MessageDispatch::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.356.2.16 virtual void activemq::commands::MessageDispatch::setMessage (const Pointer< Message > & *message*) [virtual]
- 6.356.2.17 virtual void activemq::commands::MessageDispatch::setRedeliveryCounter (int *redeliveryCounter*) [virtual]
- 6.356.2.18 virtual std::string activemq::commands::MessageDispatch::toString () const [virtual]

Returns a string containing the information for this **DataSet** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 512).

6.356.2.19 `virtual Pointer<Command> activemq::commands::MessageDispatch::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.356.3 Field Documentation

6.356.3.1 `Pointer<ConsumerId> activemq::commands::MessageDispatch::consumerId` [protected]

6.356.3.2 `Pointer<ActiveMQDestination> activemq::commands::MessageDispatch::destination` [protected]

6.356.3.3 `const unsigned char activemq::commands::MessageDispatch::ID_ - MESSAGEDISPATCH = 21` [static]

6.356.3.4 `Pointer<Message> activemq::commands::MessageDispatch::message` [protected]

6.356.3.5 `int activemq::commands::MessageDispatch::redeliveryCounter` [protected]

The documentation for this class was generated from the following file:

6.357 activemq::core::MessageDispatchChannel Class Reference

#include <src/main/activemq/core/MessageDispatchChannel.h> Inheritance diagram for activemq::core::MessageDispatchChannel:

Public Member Functions

- **MessageDispatchChannel** ()
- virtual **~MessageDispatchChannel** ()
- void **enqueue** (const **Pointer**< **MessageDispatch** > &message)
Add a Message to the Channel behind all pending message.
- void **enqueueFirst** (const **Pointer**< **MessageDispatch** > &message)
Add a message to the front of the Channel.
- bool **isEmpty** () const
- bool **isClosed** () const
- bool **isRunning** () const
- **Pointer**< **MessageDispatch** > **dequeue** (long long timeout) throw (exceptions::ActiveMQException)
Used to get an enqueued message.
- **Pointer**< **MessageDispatch** > **dequeueNoWait** ()
Used to get an enqueued message if there is one queued right now.
- **Pointer**< **MessageDispatch** > **peek** () const
Peek in the Queue and return the first message in the Channel without removing it from the channel.
- void **start** ()
Starts dispatch of messages from the Channel.
- void **stop** ()
Stops dispatch of message from the Channel.
- void **close** ()
Close this channel no messages will be dispatched after this method is called.
- void **clear** ()
Clear the Channel, all pending messages are removed.
- int **size** () const
- std::vector< **Pointer**< **MessageDispatch** > > **removeAll** ()
Remove all messages that are currently in the Channel and return them as a list of Messages.
- virtual void **lock** () throw (decaf::lang::Exception)

Locks the object.

- virtual void **unlock** () throw (decaf::lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (decaf::lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.357.1 Constructor & Destructor Documentation

6.357.1.1 activemq::core::MessageDispatchChannel::MessageDispatchChannel ()

6.357.1.2 virtual
activemq::core::MessageDispatchChannel::~~MessageDispatchChannel ()
[virtual]

6.357.2 Member Function Documentation

6.357.2.1 void activemq::core::MessageDispatchChannel::clear ()

Clear the Channel, all pending messages are removed.

6.357.2.2 void activemq::core::MessageDispatchChannel::close ()

Close this channel no messages will be dispatched after this method is called.

6.357.2.3 Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeue (long long *timeout*) throw (exceptions::ActiveMQException)

Used to get an enqueued message. The amount of time this method blocks is based on the timeout value. - if timeout== -1 then it blocks until a message is received. - if timeout==0 then it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will be consumed by this method.

Returns:

null if we timeout or if the consumer is closed.

Exceptions:

ActiveMQException

6.357.2.4 `Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeueNoWait()`

Used to get an enqueued message if there is one queued right now. If there is no waiting message than this method returns Null.

Returns:

a message if there is one in the queue.

6.357.2.5 `void activemq::core::MessageDispatchChannel::enqueue (const Pointer<MessageDispatch > & message)`

Add a Message to the Channel behind all pending message.

Parameters:

message - The message to add to the Channel.

6.357.2.6 `void activemq::core::MessageDispatchChannel::enqueueFirst (const Pointer<MessageDispatch > & message)`

Add a message to the front of the Channel.

Parameters:

message - The Message to add to the front of the Channel.

6.357.2.7 `bool activemq::core::MessageDispatchChannel::isClosed () const [inline]`

Returns:

has the Queue been closed.

6.357.2.8 `bool activemq::core::MessageDispatchChannel::isEmpty () const`

Returns:

true if there are no messages in the Channel.

6.357.2.9 `bool activemq::core::MessageDispatchChannel::isRunning () const [inline]`

Returns:

true if the Channel currently running and will dequeue message.

6.357.2.10 `virtual void activemq::core::MessageDispatchChannel::lock () throw (decaf::lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2508).

6.357.2.11 `virtual void activemq::core::MessageDispatchChannel::notify () throw (decaf::lang::Exception) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2510).

6.357.2.12 `virtual void activemq::core::MessageDispatchChannel::notifyAll () throw (decaf::lang::Exception) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2511).

6.357.2.13 `Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::peek () const`

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns:

a message if there is one in the queue.

6.357.2.14 `std::vector< Pointer<MessageDispatch> > activemq::core::MessageDispatchChannel::removeAll ()`

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns:

a list of Messages that was previously in the Channel.

6.357.2.15 `int activemq::core::MessageDispatchChannel::size () const`**Returns:**

the number of Messages currently in the Channel.

6.357.2.16 `void activemq::core::MessageDispatchChannel::start ()`

Starts dispatch of messages from the Channel.

6.357.2.17 `void activemq::core::MessageDispatchChannel::stop ()`

Stops dispatch of message from the Channel.

6.357.2.18 `virtual void activemq::core::MessageDispatchChannel::unlock () throw (decaf::lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2512).

6.357.2.19 `virtual void activemq::core::MessageDispatchChannel::wait (unsigned long milliseconds) throw (decaf::lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or `WAIT_INFINITE`

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2513).

6.357.2.20 `virtual void activemq::core::MessageDispatchChannel::wait () throw (decaf::lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/MessageDispatchChannel.h`

6.358 activemq::wireformat::openwire::marshal::v2::MessageDispatchMa Class Reference

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p.1811).

#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageDispatchMarshaller.h>Inheritance diagram for activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller:

Public Member Functions

- **MessageDispatchMarshaller** ()
- virtual **~MessageDispatchMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.358.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p.1811). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.358.2 Constructor & Destructor Documentation

6.358.2.1 `activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::MessageDispatch`
 () [inline]

6.358.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::~~MessageDispatch`
 () [inline, virtual]

6.358.3 Member Function Documentation

6.358.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::createObject`
 () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.358.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::getDataStructure`
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.358.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseMarshal`
 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.358.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.358.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.358.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.358.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

6.359.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::~~MessageDispatch`
`() [inline, virtual]`

6.359.3 Member Function Documentation

6.359.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.359.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::getDataStructure`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.359.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.359.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.359.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.359.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.359.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/MessageDispatchMarshaller.h

6.360 activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller Class Reference

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 1819).

Write a object instance to data output stream.

6.360.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 1819). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.360.2 Constructor & Destructor Documentation

6.360.2.1 `activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::MessageDispatch()` [inline]

6.360.2.2 `virtual activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::~~MessageDispatch()` [inline, virtual]

6.360.3 Member Function Documentation

6.360.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.360.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.360.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.360.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.360.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.360.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.360.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- 6.361.1.3** **virtual**
activemq::commands::MessageDispatchNotification::~~MessageDispatchNotification () [virtual]

6.361.2 Member Function Documentation

- 6.361.2.1** **virtual MessageDispatchNotification* ac-**
tivemq::commands::MessageDispatchNotification::cloneDataStructure ()
const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

- 6.361.2.2** **virtual void ac-**
tivemq::commands::MessageDispatchNotification::copyDataStructure
(const DataStructure * src) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.361.2.3 virtual bool activemq::commands::MessageDispatchNotification::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.361.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () [virtual]

6.361.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () const [virtual]

6.361.2.6 virtual unsigned char activemq::commands::MessageDispatchNotification::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.361.2.7** `virtual long long activemq::commands::MessageDispatchNotification::getDeliverySequenceId () const [virtual]`
- 6.361.2.8** `virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination () [virtual]`
- 6.361.2.9** `virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination () const [virtual]`
- 6.361.2.10** `virtual Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId () [virtual]`
- 6.361.2.11** `virtual const Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId () const [virtual]`
- 6.361.2.12** `virtual bool activemq::commands::MessageDispatchNotification::isMessageDispatchNotification () const [inline, virtual]`

Returns:

an answer of true to the `isMessageDispatchNotification()` (p. 1826) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 510).

- 6.361.2.13** `MessageDispatchNotification& activemq::commands::MessageDispatchNotification::operator= (const MessageDispatchNotification &) [inline, protected]`
- 6.361.2.14** `virtual void activemq::commands::MessageDispatchNotification::setConsumerId (const Pointer< ConsumerId > & consumerId) [virtual]`
- 6.361.2.15** `virtual void activemq::commands::MessageDispatchNotification::setDeliverySequenceId (long long deliverySequenceId) [virtual]`
- 6.361.2.16** `virtual void activemq::commands::MessageDispatchNotification::setDestination (const Pointer< ActiveMQDestination > & destination) [virtual]`
- 6.361.2.17** `virtual void activemq::commands::MessageDispatchNotification::setMessageId (const Pointer< MessageId > & messageId) [virtual]`
- 6.361.2.18** `virtual std::string activemq::commands::MessageDispatchNotification::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p.512).

- 6.361.2.19** `virtual Pointer<Command> activemq::commands::MessageDispatchNotification::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p.2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.883).

6.362.3 Member Function Documentation

6.362.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::createDataStructure()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.362.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.362.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::marshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.362 ac-
tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller

tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::looseU
(OpenWireFormat * *wireFormat*, commands::DataStructure
*** *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (**
decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller**
 (p. 530).

6.362.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightM
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException
) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller**
 (p. 531).

6.362.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.362.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller
Class Reference 1835
 Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**
 (p. 522).

6.363.3.4 **virtual void ac-**
tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::looseU
(OpenWireFormat * *wireFormat*, commands::DataStructure
*** *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (**
decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**
 (p. 523).

6.363.3.5 **virtual int ac-**
tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightM
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException
) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller**
 (p. 524).

6.363.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.363.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/MessageDispatchNotificationMarshaller.h

6.364.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchNotificationMarshaller** (p.1837). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.364.2 Constructor & Destructor Documentation

6.364.2.1 `activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::MessageDispatchNotificationMarshaller()` [inline]

6.364.2.2 `virtual activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::~MessageDispatchNotificationMarshaller()` [inline, virtual]

6.364.3 Member Function Documentation

6.364.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::createDataStructure()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.364.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.364.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::marshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.364 ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller
Class Reference 1839
 Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**
 (p. 515).

6.364.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::looseU
(OpenWireFormat * *wireFormat*, commands::DataStructure
*** *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (**
decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**
 (p. 516).

6.364.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::tightM
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException
) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**
 (p. 517).

6.364.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::tightUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.364.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::tightUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

6.366 cms::MessageFormatException Class Reference

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

#include <src/main/cms/MessageFormatException.h> Inheritance diagram for cms::MessageFormatException:

Public Member Functions

- **MessageFormatException** () throw ()
- **MessageFormatException** (const **MessageFormatException** &ex) throw ()
- **MessageFormatException** (const std::string &message, const std::exception *cause) throw ()
- **MessageFormatException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**MessageFormatException** () throw ()

6.366.1 Detailed Description

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type. It must also be thrown when equivalent type errors are made with message property values. For example, this exception must be thrown if **StreamMessage.readShort** (p. 2482) is used to read a boolean value.

Since:

1.3

6.366.2 Constructor & Destructor Documentation

- static const unsigned char **ID_MESSAGEID** = 110

Protected Attributes

- `Pointer< ProducerId > producerId`
- `long long producerSequenceId`
- `long long brokerSequenceId`

6.367.1 Member Typedef Documentation

6.367.1.1 `typedef decaf::lang::PointerComparator<MessageId>
activemq::commands::MessageId::COMPARATOR`

6.367.2 Constructor & Destructor Documentation

6.367.2.1 `activemq::commands::MessageId::MessageId ()`

6.367.2.2 `activemq::commands::MessageId::MessageId (const MessageId & other)`

6.367.2.3 `virtual activemq::commands::MessageId::~MessageId () [virtual]`

6.367.3 Member Function Documentation

6.367.3.1 `virtual MessageId* activemq::commands::MessageId::cloneDataStructure
() const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.367.3.2 `virtual int activemq::commands::MessageId::compareTo (const MessageId
& value) const [virtual]`

6.367.3.3 `virtual void activemq::commands::MessageId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.367.3.4 `virtual bool activemq::commands::MessageId::equals (const MessageId &
value) const [virtual]`

6.367.3.5 `virtual bool activemq::commands::MessageId::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are

the same.

Returns:

true if DataStructure's are Equal.

6.367.3.6 virtual long long activemq::commands::MessageId::getBrokerSequenceId
() const [virtual]

6.367.3.7 virtual unsigned char ac-
tivemq::commands::MessageId::getDataStructureType ()
const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.367.3.8 `virtual Pointer<ProducerId>& activemq::commands::MessageId::getProducerId ()`
[virtual]
- 6.367.3.9 `virtual const Pointer<ProducerId>& activemq::commands::MessageId::getProducerId () const`
[virtual]
- 6.367.3.10 `virtual long long activemq::commands::MessageId::getProducerSequenceId ()`
`const` [virtual]
- 6.367.3.11 `virtual bool activemq::commands::MessageId::operator< (const MessageId & value) const` [virtual]
- 6.367.3.12 `MessageId& activemq::commands::MessageId::operator= (const MessageId & other)`
- 6.367.3.13 `virtual bool activemq::commands::MessageId::operator== (const MessageId & value) const` [virtual]
- 6.367.3.14 `virtual void activemq::commands::MessageId::setBrokerSequenceId (long long brokerSequenceId)` [virtual]
- 6.367.3.15 `virtual void activemq::commands::MessageId::setProducerId (const Pointer< ProducerId > & producerId)` [virtual]
- 6.367.3.16 `virtual void activemq::commands::MessageId::setProducerSequenceId (long long producerSequenceId)` [virtual]
- 6.367.3.17 `virtual std::string activemq::commands::MessageId::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.560).

6.367.4 Field Documentation

Write a object instance to data output stream.

6.368.1 Detailed Description

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p.1848). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.368.2 Constructor & Destructor Documentation

6.368.2.1 `activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::MessageIdMarshaller()` [inline]

6.368.2.2 `virtual activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::~~MessageIdMarshaller()` [inline, virtual]

6.368.3 Member Function Documentation

6.368.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.368.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.368.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.368.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.368.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.368.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.368.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p. 1852). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.369.2 Constructor & Destructor Documentation

6.369.2.1 `activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::MessageIdMarshaller()` [inline]

6.369.2.2 `virtual activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::~~MessageIdMarshaller()` [inline, virtual]

6.369.3 Member Function Documentation

6.369.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.369.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.369.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.369.3.4 virtual void **activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.369.3.5 virtual int **activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - **BooleanStream** stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.369.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.369.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/MessageIdMarshaller.h

6.370 activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller Class Reference

Write a object instance to data output stream.

6.370.1 Detailed Description

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p. 1856). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.370.2 Constructor & Destructor Documentation

6.370.2.1 `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::MessageIdMarshaller()` [inline]

6.370.2.2 `virtual activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::~~MessageIdMarshaller()` [inline, virtual]

6.370.3 Member Function Documentation

6.370.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.370.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.370.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.370.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.370.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.370.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.370.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/MessageIdMarshaller.h

6.371 cms::MessageListener Class Reference

A `MessageListener` (p. 1860) object is used to receive asynchronously delivered messages.

```
#include <src/main/cms/MessageListener.h>
```

Public Member Functions

- virtual `~MessageListener ()`
- virtual void `onMessage (const Message *message)=0`

*Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 1753) types.*

6.371.1 Detailed Description

A `MessageListener` (p. 1860) object is used to receive asynchronously delivered messages.

Since:

1.0

6.371.2 Constructor & Destructor Documentation

6.371.2.1 virtual `cms::MessageListener::~~MessageListener ()` [inline, virtual]

6.371.3 Member Function Documentation

6.371.3.1 virtual void `cms::MessageListener::onMessage (const Message * message)`
[pure virtual]

Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 1753) types. a dynamic cast is used to find out what type of message this is. The lifetime of this object is only guaranteed to be for life of the `onMessage` function after this call-back returns the message may no longer exists. Users should copy the data or clone the message if they wish to retain information that was contained in this **Message** (p. 1753).

It is considered a programming error for this method to throw an exception.

Parameters:

message **Message** (p. 1753) object {const} pointer recipient does not own.

The documentation for this class was generated from the following file:

- `src/main/cms/MessageListener.h`

6.372 activemq::wireformat::openwire::marshal::v2::MessageMarshaller Class Reference

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 1861).

#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v2::MessageMarshaller:

Public Member Functions

- **MessageMarshaller** ()
- virtual **~MessageMarshaller** ()
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.372.1 Detailed Description

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 1861). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.372.2 Constructor & Destructor Documentation

6.372.2.1 `activemq::wireformat::openwire::marshal::v2::MessageMarshaller::MessageMarshaller()` [inline]

6.372.2.2 `virtual activemq::wireformat::openwire::marshal::v2::MessageMarshaller::~~MessageMarshaller()` [inline, virtual]

6.372.3 Member Function Documentation

6.372.3.1 `virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 160), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 187), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 276), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 291), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 322), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 396), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 462).

6.372.3.2 `virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 161), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 277), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 292), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 323), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 397), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 463).

```
6.372.3.3 virtual int ac-
          tivemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightMarshal1
          (OpenWireFormat * wireFormat, commands::DataStructure *
          dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException
          ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 161), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 277), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 292), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 323), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 397), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 463).

6.372.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 162), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 189), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 278), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 293), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 324), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 398), and **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 464).

6.372.3.5 virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 162), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 189), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 278), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 293), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 324), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 398), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 464).

6.373.1 Detailed Description

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 1866). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.373.2 Constructor & Destructor Documentation

6.373.2.1 `activemq::wireformat::openwire::marshal::v3::MessageMarshaller::MessageMarshaller()` [inline]

6.373.2.2 `virtual activemq::wireformat::openwire::marshal::v3::MessageMarshaller::~~MessageMarshaller()` [inline, virtual]

6.373.3 Member Function Documentation

6.373.3.1 `virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 152), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 179), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 268), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 283), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 314), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 388), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 454).

6.373.3.2 `virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 153), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 180), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 269), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 284), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 315), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 389), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 455).

```
6.373.3.3  virtual int ac-
            tivemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightMarshal1
            (OpenWireFormat * wireFormat,  commands::DataStructure *
            dataStructure,  utils::BooleanStream * bs) throw ( decaf::io::IOException
            ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 153), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 180), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 269), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 284), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 315), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 389), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 455).

6.373.3.4 virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller** (p. 154), **activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller** (p. 181), **activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller** (p. 270), **activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller** (p. 285), **activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller** (p. 316), **activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller** (p. 390), and **activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller** (p. 456).

6.373.3.5 virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 154), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 181), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 270), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 285), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 316), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 390), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 456).

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 156), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 183), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 272), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 287), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 318), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 392), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 458).

- 6.374.3.2** `virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 157), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 273), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 288), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 319), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 393), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 459).

```
6.374.3.3 virtual int ac-
          tivemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal1
          (OpenWireFormat * wireFormat, commands::DataStructure *
           dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException
          ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 157), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 273), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 288), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 319), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 393), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 459).

6.374.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 158), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 185), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 274), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 289), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 320), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 394), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 460).

6.374.3.5 `virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 158), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 185), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 274), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 289), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 320), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 394), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 460).

Gets if Message (p. 1753) Ids are disabled for this Producer.
- virtual void `setDisableMessageTimeStamp (bool value)=0 throw (CMSEException)`
Sets if Message (p. 1753) Time Stamps are disabled for this Producer.
- virtual bool `getDisableMessageTimeStamp () const =0 throw (CMSEException)`
Gets if Message (p. 1753) Time Stamps are disabled for this Producer.
- virtual void `setPriority (int priority)=0 throw (CMSEException)`
Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () const =0 throw (CMSEException)
Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time)=0 throw (CMSEException)
Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () const =0 throw (CMSEException)
Gets the Time to Live that this producer sends messages with.

6.377.1 Detailed Description

A client uses a **MessageProducer** (p. 1878) object to send messages to a **Destination** (p. 1190). A **MessageProducer** (p. 1878) object is created by passing a **Destination** (p. 1190) object to a message-producer creation method supplied by a session.

A client also has the option of creating a message producer without supplying a destination. In this case, a **Destination** (p. 1190) must be provided with every send operation. A typical use for this kind of message producer is to send replies to requests using the request's **CMSReplyTo** destination.

A client can specify a default delivery mode, priority, and time to live for messages sent by a message producer. It can also specify the delivery mode, priority, and time to live for an individual message.

A client can specify a time-to-live value in milliseconds for each message it sends. This value defines a message expiration time that is the sum of the message's time-to-live and the GMT when it is sent (for transacted sends, this is the time the client sends the message, not the time the transaction is committed).

Since:

1.0

6.377.2 Constructor & Destructor Documentation

6.377.2.1 virtual cms::MessageProducer::~~MessageProducer () [inline, virtual]

6.377.3 Member Function Documentation

6.377.3.1 virtual int cms::MessageProducer::getDeliveryMode () const throw (CMSEException) [pure virtual]

Gets the delivery mode for this Producer.

Returns:

The **DeliveryMode** (p. 1188)

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 778), and **activemq::core::ActiveMQProducer** (p. 327).

6.377.3.2 `virtual bool cms::MessageProducer::getDisableMessageID () const throw (CMSEException) [pure virtual]`

Gets if **Message** (p. 1753) Ids are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 779), and `activemq::core::ActiveMQProducer` (p. 327).

6.377.3.3 `virtual bool cms::MessageProducer::getDisableMessageTimeStamp () const throw (CMSEException) [pure virtual]`

Gets if **Message** (p. 1753) Time Stamps are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 779), and `activemq::core::ActiveMQProducer` (p. 327).

6.377.3.4 `virtual int cms::MessageProducer::getPriority () const throw (CMSEException) [pure virtual]`

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 779), and `activemq::core::ActiveMQProducer` (p. 328).

6.377.3.5 `virtual long long cms::MessageProducer::getTimeToLive () const throw (CMSEException) [pure virtual]`

Gets the Time to Live that this producer sends messages with.

Returns:

Time to live value in milliseconds

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 779), and `activemq::core::ActiveMQProducer` (p. 328).

6.377.3.6 `virtual void cms::MessageProducer::send (const Destination * destination, Message * message, int deliveryMode, int priority, long timeToLive) throw (CMSEException)` [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 780), and `activemq::core::ActiveMQProducer` (p. 329).

6.377.3.7 `virtual void cms::MessageProducer::send (const Destination * destination, Message * message) throw (CMSEException)` [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

destination The destination on which to send the message

message the message to be sent.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 780), and `activemq::core::ActiveMQProducer` (p. 329).

6.377.3.8 `virtual void cms::MessageProducer::send (Message * message,
int deliveryMode, int priority, long long timeToLive) throw (`
`CMSEException)` [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 780), and `activemq::core::ActiveMQProducer` (p. 330).

6.377.3.9 `virtual void cms::MessageProducer::send (Message * message) throw (`
`CMSEException)` [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

message The message to be sent.

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 781), and `activemq::core::ActiveMQProducer` (p. 330).

6.377.3.10 `virtual void cms::MessageProducer::setDeliveryMode (int mode) throw`
`(CMSEException)` [pure virtual]

Sets the delivery mode for this Producer.

Parameters:

mode The `DeliveryMode` (p. 1188)

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 781), and `activemq::core::ActiveMQProducer` (p. 330).

6.377.3.11 `virtual void cms::MessageProducer::setDisableMessageID (bool value)
 throw (CMSException)` [pure virtual]

Sets if **Message** (p. 1753) Ids are disabled for this Producer.

Parameters:

value boolean indicating enable / disable (true / false)

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 781), and **activemq::core::ActiveMQProducer** (p. 330).

6.377.3.12 `virtual void cms::MessageProducer::setDisableMessageTimeStamp
 (bool value) throw (CMSException)` [pure virtual]

Sets if **Message** (p. 1753) Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 782), and **activemq::core::ActiveMQProducer** (p. 331).

6.377.3.13 `virtual void cms::MessageProducer::setPriority (int priority) throw (CMSException)` [pure virtual]

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Exceptions:

CMSException (p. 850) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 782), and **activemq::core::ActiveMQProducer** (p. 331).

6.377.3.14 `virtual void cms::MessageProducer::setTimeToLive (long long time)
 throw (CMSException)` [pure virtual]

Sets the Time to Live that this Producers sends messages with. This value will be used if the time to live is not specified via the send method.

Parameters:

time default time to live value in milliseconds

Exceptions:

CMSEException (p. 850) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 782), and **activemq::core::ActiveMQProducer** (p. 331).

The documentation for this class was generated from the following file:

- `src/main/cms/MessageProducer.h`

6.378 activemq::wireformat::openwire::utils::MessagePropertyInterceptor Class Reference

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

```
#include <src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h>
```

Public Member Functions

- **MessagePropertyInterceptor** (commands::Message *message, util::PrimitiveMap *properties) throw (decaf::lang::exceptions::NullPointerException)

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

- virtual ~**MessagePropertyInterceptor** ()
- virtual bool **getBooleanProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a boolean property.

- virtual unsigned char **getByteProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a byte property.

- virtual double **getDoubleProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a double property.

- virtual float **getFloatProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a float property.

- virtual int **getIntProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a int property.

- virtual long long **getLongProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a long property.

- virtual short **getShortProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a short property.

- virtual std::string **getStringProperty** (const std::string &name) const throw (exceptions::ActiveMQException)

Gets a string property.

- virtual void **setBooleanProperty** (const std::string &name, bool value) throw (exceptions::ActiveMQException)

Sets a boolean property.

- virtual void **setByteProperty** (const std::string &name, unsigned char value) throw (exceptions::ActiveMQException)

Sets a byte property.

- virtual void **setDoubleProperty** (const std::string &name, double value) throw (exceptions::ActiveMQException)

Sets a double property.

- virtual void **setFloatProperty** (const std::string &name, float value) throw (exceptions::ActiveMQException)

Sets a float property.

- virtual void **setIntProperty** (const std::string &name, int value) throw (exceptions::ActiveMQException)

Sets a int property.

- virtual void **setLongProperty** (const std::string &name, long long value) throw (exceptions::ActiveMQException)

Sets a long property.

- virtual void **setShortProperty** (const std::string &name, short value) throw (exceptions::ActiveMQException)

Sets a short property.

- virtual void **setStringProperty** (const std::string &name, const std::string &value) throw (exceptions::ActiveMQException)

Sets a string property.

6.378.1 Detailed Description

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties. Currently the only properties that are intercepted and handled are:

Name | Conversion Supported ----- JMSXDeliveryCount | Int, Long, String JMSXGroupID | String JMSXGroupSeq | Int, Long, String

6.378.2 Constructor & Destructor Documentation

6.378.2.1 activemq::wireformat::openwire::utils::MessagePropertyInterceptor::MessagePropertyInterceptor (commands::Message * *message*, util::PrimitiveMap * *properties*) throw (decaf::lang::exceptions::NullPointerException)

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

Parameters:

message - The Message to store reserved property data in

properties - The PrimitiveMap to store the rest of the properties in.

Exceptions:

NullPointerException if either param is NULL

6.378.2.2 virtual
activemq::wireformat::openwire::utils::MessagePropertyInterceptor::~~MessagePropertyInt
() [virtual]

6.378.3 Member Function Documentation

6.378.3.1 virtual bool ac-
tivismq::wireformat::openwire::utils::MessagePropertyInterceptor::getBooleanProperty
(const std::string & *name*) const throw (exceptions::ActiveMQException
) [virtual]

Gets a boolean property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.2 virtual unsigned char ac-
tivismq::wireformat::openwire::utils::MessagePropertyInterceptor::getBytesProperty
(const std::string & *name*) const throw (exceptions::ActiveMQException
) [virtual]

Gets a byte property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.3 `virtual double activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getDoubleProperty(const std::string & name) const throw (exceptions::ActiveMQException) [virtual]`

Gets a double property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.4 `virtual float activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getFloatProperty(const std::string & name) const throw (exceptions::ActiveMQException) [virtual]`

Gets a float property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.5 `virtual int activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getIntProperty(const std::string & name) const throw (exceptions::ActiveMQException) [virtual]`

Gets a int property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.6 virtual long long activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getLongProperty (const std::string & *name*) const throw (exceptions::ActiveMQException) [virtual]

Gets a long property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.7 virtual short activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getShortProperty (const std::string & *name*) const throw (exceptions::ActiveMQException) [virtual]

Gets a short property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.8 virtual std::string activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getStringProperty (const std::string & *name*) const throw (exceptions::ActiveMQException) [virtual]

Gets a string property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.378.3.9 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setBooleanProperty (const std::string & *name*, bool *value*) throw (exceptions::ActiveMQException) [virtual]

Sets a boolean property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.378.3.10 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setByteProperty (const std::string & *name*, unsigned char *value*) throw (exceptions::ActiveMQException) [virtual]

Sets a byte property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.378.3.11 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setDoubleProperty (const std::string & *name*, double *value*) throw (exceptions::ActiveMQException) [virtual]

Sets a double property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.378.3.12 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setFloatProperty (const std::string & *name*, float *value*) throw (exceptions::ActiveMQException) [virtual]

Sets a float property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.378.3.13 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setIntProperty (const std::string & *name*, int *value*) throw (exceptions::ActiveMQException) [virtual]

Sets a int property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.378.3.14 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setLongProperty (const std::string & *name*, long long *value*) throw (exceptions::ActiveMQException) [virtual]

Sets a long property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.378.3.15 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setShortProperty (const std::string & name, short value) throw (exceptions::ActiveMQException) [virtual]`

Sets a short property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.378.3.16 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setStringProperty (const std::string & name, const std::string & value) throw (exceptions::ActiveMQException) [virtual]`

Sets a string property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h`

6.379 activemq::commands::MessagePull Class Reference

#include <src/main/activemq/commands/MessagePull.h> Inheritance diagram for activemq::commands::MessagePull:

Public Member Functions

- **MessagePull** ()
- virtual **~MessagePull** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **MessagePull * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ConsumerId** > & **getConsumerId** () const
- virtual **Pointer**< **ConsumerId** > & **getConsumerId** ()
- virtual void **setConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)

- virtual void **setMessageId** (const **Pointer**< **MessageId** > &messageId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_MESSAGEPULL** = 20

Protected Member Functions

- `MessagePull (const MessagePull &)`
- `MessagePull & operator= (const MessagePull &)`

Protected Attributes

- `Pointer< ConsumerId > consumerId`
- `Pointer< ActiveMQDestination > destination`
- `long long timeout`
- `std::string correlationId`
- `Pointer< MessageId > messageId`

6.379.1 Constructor & Destructor Documentation

6.379.1.1 `activemq::commands::MessagePull::MessagePull (const MessagePull &)`
[inline, protected]

6.379.1.2 `activemq::commands::MessagePull::MessagePull ()`

6.379.1.3 `virtual activemq::commands::MessagePull::~~MessagePull ()` [virtual]

6.379.2 Member Function Documentation

6.379.2.1 `virtual MessagePull* activemq::commands::MessagePull::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.379.2.2 `virtual void activemq::commands::MessagePull::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.379.2.3 virtual bool activemq::commands::MessagePull::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.379.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () [virtual]**6.379.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () const [virtual]****6.379.2.6 virtual std::string& activemq::commands::MessagePull::getCorrelationId () [virtual]****6.379.2.7 virtual const std::string& activemq::commands::MessagePull::getCorrelationId () const [virtual]****6.379.2.8 virtual unsigned char activemq::commands::MessagePull::getDataStructureType () const [virtual]**

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.379.2.9 `virtual Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination ()` [virtual]
- 6.379.2.10 `virtual const Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () const` [virtual]
- 6.379.2.11 `virtual Pointer<MessageId>& activemq::commands::MessagePull::getMessageId ()` [virtual]
- 6.379.2.12 `virtual const Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () const` [virtual]
- 6.379.2.13 `virtual long long activemq::commands::MessagePull::getTimeout ()` const [virtual]
- 6.379.2.14 `MessagePull& activemq::commands::MessagePull::operator= (const MessagePull &)` [inline, protected]
- 6.379.2.15 `virtual void activemq::commands::MessagePull::setConsumerId (const Pointer< ConsumerId > & consumerId)` [virtual]
- 6.379.2.16 `virtual void activemq::commands::MessagePull::setCorrelationId (const std::string & correlationId)` [virtual]
- 6.379.2.17 `virtual void activemq::commands::MessagePull::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.379.2.18 `virtual void activemq::commands::MessagePull::setMessageId (const Pointer< MessageId > & messageId)` [virtual]
- 6.379.2.19 `virtual void activemq::commands::MessagePull::setTimeout (long long timeout)` [virtual]
- 6.379.2.20 `virtual std::string activemq::commands::MessagePull::toString ()` const [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p.512).

- 6.379.2.21 `virtual Pointer<Command> activemq::commands::MessagePull::visit (activemq::state::CommandVisitor * visitor)` throw (`exceptions::ActiveMQException`) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the

visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.379.3 Field Documentation

Write a object instance to data output stream.

6.380.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p.1898). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.380.2 Constructor & Destructor Documentation

6.380.2.1 `activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::MessagePullMarshaller()` [inline]

6.380.2.2 `virtual activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::~~MessagePullMarshaller()` [inline, virtual]

6.380.3 Member Function Documentation

6.380.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.380.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.380.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.380.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.380.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.380.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.380.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

6.381.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p.1902). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.381.2 Constructor & Destructor Documentation

6.381.2.1 `activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::MessagePullMarshaller()` [inline]

6.381.2.2 `virtual activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::~~MessagePullMarshaller()` [inline, virtual]

6.381.3 Member Function Documentation

6.381.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.381.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.381.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.381.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.381.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.381.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.381.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.382.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p.1906). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.382.2 Constructor & Destructor Documentation

6.382.2.1 `activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::MessagePullMarshaller()` [inline]

6.382.2.2 `virtual activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::~~MessagePullMarshaller()` [inline, virtual]

6.382.3 Member Function Documentation

6.382.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.382.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.382.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.382.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.382.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.382.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.382.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

6.383.1 Detailed Description

The **MockTransport** (p. 1910) defines a base level **Transport** (p. 2608) class that is intended to be used in place of an a regular protocol **Transport** (p. 2608) such as TCP. This **Transport** (p. 2608) assumes that it is the base **Transport** (p. 2608) in the Transports stack, and destroys any Transports that are passed to it in its constructor.

This **Transport** (p. 2608) defines an Interface **ResponseBuilder** (p. 2235) which must be implemented by any protocol for which the **Transport** (p. 2608) is used to Emulate. The **Transport** (p. 2608) hands off all outbound **commands** (p. 59) to the **ResponseBuilder** (p. 2235) for processing, it is up to the builder to create appropriate responses and schedule any asynchronous messages that might result from a message sent to the Broker.

6.383.2 Constructor & Destructor Documentation

6.383.2.1 `activemq::transport::mock::MockTransport::MockTransport (const Pointer< wireformat::WireFormat > & wireFormat, const Pointer< ResponseBuilder > & responseBuilder)`

6.383.2.2 `virtual activemq::transport::mock::MockTransport::~MockTransport () [inline, virtual]`

6.383.3 Member Function Documentation

6.383.3.1 `virtual void activemq::transport::mock::MockTransport::close () throw (cms::CMSException) [inline, virtual]`

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSException - If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 838).

6.383.3.2 `virtual void activemq::transport::mock::MockTransport::fireCommand (const Pointer< Command > & command) [inline, virtual]`

Fires a Command back through this **transport** (p. 67) to its registered CommandListener if there is one.

Parameters:

command - Command to send to the Listener.

6.383.3.3 `virtual void activemq::transport::mock::MockTransport::fireException (const exceptions::ActiveMQException & ex) [inline, virtual]`

Fires a Exception back through this **transport** (p. 67) to its registered ExceptionListener if there is one.

Parameters:

ex The Exception that will be passed on the the **Transport** (p. 2608) listener.

- 6.383.3.4** static MockTransport* activemq::transport::mock::MockTransport::getInstance ()
[inline, static]
- 6.383.3.5** int activemq::transport::mock::MockTransport::getNumReceivedMessageBeforeFail () const [inline]
- 6.383.3.6** int activemq::transport::mock::MockTransport::getNumReceivedMessages () const [inline]
- 6.383.3.7** int activemq::transport::mock::MockTransport::getNumSentMessageBeforeFail () const [inline]
- 6.383.3.8** int activemq::transport::mock::MockTransport::getNumSentMessages () const [inline]
- 6.383.3.9** virtual std::string activemq::transport::mock::MockTransport::getRemoteAddress () const [inline, virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 2609).

- 6.383.3.10** virtual TransportListener* activemq::transport::mock::MockTransport::getTransportListener () const [inline, virtual]

Gets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).

Returns:

The listener of **transport** (p. 67) events.

Implements **activemq::transport::Transport** (p. 2609).

- 6.383.3.11** virtual bool activemq::transport::mock::MockTransport::isClosed () const [inline, virtual]

Has the **Transport** (p. 2608) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 2608)

Implements **activemq::transport::Transport** (p. 2609).

6.383.3.12 `virtual bool activemq::transport::mock::MockTransport::isConnected () const [inline, virtual]`

Is the **Transport** (p. 2608) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2610).

6.383.3.13 `bool activemq::transport::mock::MockTransport::isFailOnReceiveMessage () const [inline]`

6.383.3.14 `bool activemq::transport::mock::MockTransport::isFailOnSendMessage () const [inline]`

6.383.3.15 `virtual bool activemq::transport::mock::MockTransport::isFaultTolerant () const [inline, virtual]`

Is this **Transport** (p. 2608) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 2608) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2610).

6.383.3.16 `virtual Transport* activemq::transport::mock::MockTransport::narrow (const std::type_info & typeId) [inline, virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 2608) to allow a higher level **transport** (p. 67) to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2610).

6.383.3.17 `virtual void activemq::transport::mock::MockTransport::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2610).

6.383.3.18 `virtual void activemq::transport::mock::MockTransport::reconnect (const decaf::net::URI &uri AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

6.383.3.19 `virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters:

command - The command to be sent.

timeout - The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2611).

6.383.3.20 `virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Implements **activemq::transport::Transport** (p. 2612).

- 6.383.3.21 **void** **activemq::transport::mock::MockTransport::setFailOnReceiveMessage**
 (**bool** *value*) [inline]
- 6.383.3.22 **void** **activemq::transport::mock::MockTransport::setFailOnSendMessage**
 (**bool** *value*) [inline]
- 6.383.3.23 **void** **activemq::transport::mock::MockTransport::setNumReceivedMessageBeforeFail**
 (**int** *value*) [inline]
- 6.383.3.24 **void** **activemq::transport::mock::MockTransport::setNumReceivedMessages**

 (**int** *value*) [inline]
- 6.383.3.26 **void** **activemq::transport::mock::MockTransport::setNumSentMessages**
 (**int** *value*) [inline]
- 6.383.3.27 **virtual void** **activemq::transport::mock::MockTransport::setOutgoingListener**
 (**TransportListener** * *listener*) [inline, virtual]

Sets a Listener that gets notified for every command that would have been sent by this **transport** (p. 67) to the Broker, this allows a client to verify that its messages are making it to the wire.

Parameters:

listener - The CommandListener to notify for each message

- 6.383.3.28 **void** **activemq::transport::mock::MockTransport::setResponseBuilder**
 (**const Pointer**< **ResponseBuilder** > & *responseBuilder*) [inline]

Sets the **ResponseBuilder** (p. 2235) that this class uses to create Responses to Commands sent. These are either real Response Objects, or Commands that would have been sent Asynchronously be the Broker.

Parameters:

responseBuilder - The **ResponseBuilder** (p. 2235) to use from now on.

6.383.3.29 virtual void activemq::transport::mock::MockTransport::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous **exceptions** (p. 62) from this **transport** (p. 67).

Parameters:

listener the listener of **transport** (p. 67) events.

Implements **activemq::transport::Transport** (p. 2612).

6.383.3.30 virtual void activemq::transport::mock::MockTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat *AMQCPP_UNUSED*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat WireFormat the object used to encode / decode **commands** (p. 59).

6.383.3.31 virtual void activemq::transport::mock::MockTransport::start () throw (cms::CMSEException) [inline, virtual]

Starts the service.

Exceptions:

CMSEException if an internal error occurs while starting.

Implements **cms::Startable** (p. 2413).

The documentation for this class was generated from the following file:

6.384.1 Detailed Description

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

6.384.2 Constructor & Destructor Documentation

6.384.2.1 virtual
activemq::transport::mock::MockTransportFactory::~MockTransportFactory
() [inline, virtual]

6.384.3 Member Function Documentation

6.384.3.1 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::create (const
decaf::net::URI & *location*) throw (exceptions::ActiveMQException)
[virtual]

Creates a fully configured **Transport** (p.2608) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.2614).

6.384.3.2 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::createComposite (const
decaf::net::URI & *location*) throw (exceptions::ActiveMQException)
[virtual]

Creates a slimed down **Transport** (p.2608) instance which can be used in composite **transport** (p.67) instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.2615).

6.384.3.3 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::doCreateComposite
(const decaf::net::URI & *location*, const Pointer<
wireformat::WireFormat > & *wireFormat*, const decaf::util::Properties
& *properties*) throw (exceptions::ActiveMQException) [protected,
virtual]

Creates a slimed down **Transport** (p.2608) instance which can be used in composite **transport** (p.67) instances.

Parameters:

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 2608).

properties - Properties to apply to the **transport** (p. 67).

Returns:

Pointer to a new **Transport** (p. 2608) instance.

Exceptions:

ActiveMQException if an error occurs

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/mock/MockTransportFactory.h`

6.385 decaf::util::concurrent::Mutex Class Reference

Creates a `pthread_mutex_t` object.

`#include <src/main/decaf/util/concurrent/Mutex.h>`Inheritance diagram for `decaf::util::concurrent::Mutex`:

Public Member Functions

- **Mutex** ()
Constructor - creates and initializes the mutex.
- virtual **~Mutex** ()
Destructor - destroys the mutex object.
- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.385.1 Detailed Description

Creates a `pthread_mutex_t` object. The object is created such that successive **locks** (p. 119) from the same thread is allowed and will be successful.

See also:

`pthread_mutex_t`

6.385.2 Constructor & Destructor Documentation

6.385.2.1 decaf::util::concurrent::Mutex::Mutex ()

Constructor - creates and initializes the mutex.

6.385.2.2 virtual decaf::util::concurrent::Mutex::~~Mutex () [virtual]

Destructor - destroys the mutex object.

6.385.3 Member Function Documentation**6.385.3.1 virtual void decaf::util::concurrent::Mutex::lock () throw (lang::Exception) [virtual]**

Locks the object.

Exceptions:*ActiveMQException*

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::lock()`, `decaf::util::StlMap< std::string, cms::Topic * >::lock()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::lock()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::lock()`.

6.385.3.2 virtual void decaf::util::concurrent::Mutex::notify () throw (lang::Exception) [virtual]

Signals a waiter on this object that it can now wake up and continue.

Exceptions:*ActiveMQException*

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notify()`, `decaf::util::StlMap< std::string, cms::Topic * >::notify()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notify()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::notify()`.

Signals the waiters on this object that it can now wake up and continue.

Exceptions:*ActiveMQException*

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notifyAll()`, `decaf::util::StlMap< std::string, cms::Topic * >::notifyAll()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notifyAll()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::notifyAll()`.

6.385.3.4 virtual void decaf::util::concurrent::Mutex::unlock () throw (lang::Exception) [virtual]

Unlocks the object.

Exceptions:

ActiveMQException

Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::unlock()`, `decaf::util::StlMap< std::string, cms::Topic * >::unlock()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::unlock()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::unlock()`.

6.385.3.5 virtual void decaf::util::concurrent::Mutex::wait (unsigned long *milliseconds*) throw (lang::Exception) [virtual]

Waits on a signal from this object, which is generated by a call to `Notify`. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait.

Exceptions:

ActiveMQException

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.385.3.6 virtual void decaf::util::concurrent::Mutex::wait () throw (lang::Exception) [virtual]

Waits on a signal from this object, which is generated by a call to `Notify`.

Exceptions:

ActiveMQException

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::wait()`, `decaf::util::StlMap< std::string, cms::Topic * >::wait()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::wait()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::wait()`.

6.386 activemq::commands::NetworkBridgeFilter Class Reference

#include <src/main/activemq/commands/NetworkBridgeFilter.h> Inheritance diagram for activemq::commands::NetworkBridgeFilter:

Public Member Functions

- **NetworkBridgeFilter** ()
- virtual **~NetworkBridgeFilter** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **NetworkBridgeFilter * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual int **getNetworkTTL** () const
- virtual void **setNetworkTTL** (int networkTTL)
- virtual const **Pointer**< **BrokerId** > & **getNetworkBrokerId** () const
- virtual **Pointer**< **BrokerId** > & **getNetworkBrokerId** ()
- virtual void **setNetworkBrokerId** (const **Pointer**< **BrokerId** > &networkBrokerId)

Static Public Attributes

- static const unsigned char **ID_NETWORKBRIDGEFILTER** = 91

Protected Member Functions

- **NetworkBridgeFilter** (const **NetworkBridgeFilter** &)
- **NetworkBridgeFilter** & **operator=** (const **NetworkBridgeFilter** &)

Protected Attributes

- int **networkTTL**
- **Pointer**< **BrokerId** > **networkBrokerId**

6.386.1 Constructor & Destructor Documentation

6.386.1.1 `activemq::commands::NetworkBridgeFilter::NetworkBridgeFilter (const NetworkBridgeFilter &) [inline, protected]`

6.386.1.2 `activemq::commands::NetworkBridgeFilter::NetworkBridgeFilter ()`

6.386.1.3 `virtual
activemq::commands::NetworkBridgeFilter::~~NetworkBridgeFilter ()
[virtual]`

6.386.2 Member Function Documentation

6.386.2.1 `virtual NetworkBridgeFilter* ac-
tivemq::commands::NetworkBridgeFilter::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.386.2.2 `virtual void ac-
tivemq::commands::NetworkBridgeFilter::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.386.2.3 `virtual bool activemq::commands::NetworkBridgeFilter::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

6.386.2.4 `virtual unsigned char ac-
tivemq::commands::NetworkBridgeFilter::getDataStructureType () const
[virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

- 6.386.2.5 **virtual** **Pointer**<**BrokerId**>& **activemq::commands::NetworkBridgeFilter::getNetworkBrokerId** ()
[virtual]
- 6.386.2.6 **virtual const** **Pointer**<**BrokerId**>& **activemq::commands::NetworkBridgeFilter::getNetworkBrokerId** () **const**
[virtual]
- 6.386.2.7 **virtual int** **activemq::commands::NetworkBridgeFilter::getNetworkTTL** () **const** [virtual]
- 6.386.2.8 **NetworkBridgeFilter**& **activemq::commands::NetworkBridgeFilter::operator=** (**const** **NetworkBridgeFilter** &) [inline, protected]
- 6.386.2.9 **virtual void** **activemq::commands::NetworkBridgeFilter::setNetworkBrokerId** (**const** **Pointer**< **BrokerId** > & *networkBrokerId*) [virtual]
- 6.386.2.10 **virtual void** **activemq::commands::NetworkBridgeFilter::setNetworkTTL** (**int** *networkTTL*) [virtual]
- 6.386.2.11 **virtual std::string** **activemq::commands::NetworkBridgeFilter::toString** () **const** [virtual]

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 560).

6.386.3 Field Documentation

- 6.386.3.1 **const unsigned char** **activemq::commands::NetworkBridgeFilter::ID_ - NETWORKBRIDGEFILTER** = 91 [static]

[protected]
- 6.386.3.3 **int** **activemq::commands::NetworkBridgeFilter::networkTTL** [protected]

The documentation for this class was generated from the following file:

- **src/main/activemq/commands/NetworkBridgeFilter.h**

6.387 activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller Class Reference

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p.1927).

#include <src/main/activemq/wireformat/openwire/marshal/v3/NetworkBridgeFilterMarshaller.h>Inheritance diagram for activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller:

Public Member Functions

- **NetworkBridgeFilterMarshaller** ()
- virtual **~NetworkBridgeFilterMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.387.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p.1927).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.387.2 Constructor & Destructor Documentation

6.387.2.1 `activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller()` [inline]

6.387.2.2 `virtual activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller()` [inline, virtual]

6.387.3 Member Function Documentation

6.387.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.387.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.387.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.387.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.387.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.387.3.6 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.387.3.7 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.388.3 Member Function Documentation

6.388.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.388.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.388.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.388.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseUnmarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.388.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.388.3.6 virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.388.3.7 virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

6.389.3 Member Function Documentation

6.389.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.389.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.389.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.389.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.389.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.389.3.6 virtual void activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.389.3.7 virtual void activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

6.390.1 Constructor & Destructor Documentation

6.390.1.1 decaf::net::NoRouteToHostException::NoRouteToHostException () throw () [inline]

Default Constructor.

6.390.1.2 decaf::net::NoRouteToHostException::NoRouteToHostException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.390.1.3 `decaf::net::NoRouteToHostException::NoRouteToHostException (const NoRouteToHostException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.390.1.4 `decaf::net::NoRouteToHostException::NoRouteToHostException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.390.1.5 `decaf::net::NoRouteToHostException::NoRouteToHostException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.390.1.6 `decaf::net::NoRouteToHostException::NoRouteToHostException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.390.1.7 **virtual**
decaf::net::NoRouteToHostException::~~NoRouteToHostException ()
throw () [inline, virtual]

6.390.2 Member Function Documentation

6.390.2.1 **virtual NoRouteToHostException* de-**
caf::net::NoRouteToHostException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2380).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/NoRouteToHostException.h`

6.391 decaf::security::NoSuchAlgorithmException Class Reference

#include <src/main/decaf/security/NoSuchAlgorithmException.h> Inheritance diagram for decaf::security::NoSuchAlgorithmException:

Public Member Functions

- **NoSuchAlgorithmException** () throw ()
Default Constructor.

Clones this exception.
- virtual ~**NoSuchAlgorithmException** () throw ()

6.391.1 Constructor & Destructor Documentation

6.391.1.1 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException () throw () [inline]

Default Constructor.

6.391.1.2 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.391.1.3 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException
(const NoSuchAlgorithmException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.391.1.4 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException
(const char * *file*, const int *lineNumber*, const std::exception * *cause*,
const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.391.1.5 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException
(const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.391.1.6 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException
(const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()
[inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.391.1.7 **virtual**

Default Constructor.

6.392.1.2 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.392.1.3 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const NoSuchElementException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.392.1.4 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.392.1.5 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.392.1.6 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

6.395 decaf::lang::Number Class Reference

The abstract class **Number** (p. 1954) is the superclass of classes **Byte** (p. 664), **Double** (p. 1231), **Float** (p. 1328), **Integer** (p. 1428), **Long** (p. 1652), and **Short** (p. 2321).

#include <src/main/decaf/lang/Number.h> Inheritance diagram for decaf::lang::Number:

Public Member Functions

- virtual `~Number ()`
- virtual unsigned char `byteValue () const`
Answers the byte value which the receiver represents.
- virtual double `doubleValue () const =0`
Answers the double value which the receiver represents.
- virtual float `floatValue () const =0`
Answers the float value which the receiver represents.
- virtual int `intValue () const =0`
Answers the int value which the receiver represents.
- virtual long long `longValue () const =0`
Answers the long value which the receiver represents.
- virtual short `shortValue () const`
Answers the short value which the receiver represents.

6.395.1 Detailed Description

The abstract class **Number** (p. 1954) is the superclass of classes **Byte** (p. 664), **Double** (p. 1231), **Float** (p. 1328), **Integer** (p. 1428), **Long** (p. 1652), and **Short** (p. 2321). Subclasses of **Number** (p. 1954) must provide methods to convert the represented numeric value to byte, double, float, int, long, and short.

6.395.2 Constructor & Destructor Documentation

6.395.2.1 virtual `decaf::lang::Number::~~Number ()` [inline, virtual]

6.395.3 Member Function Documentation

6.395.3.1 virtual unsigned char `decaf::lang::Number::byteValue () const` [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented in **decaf::lang::Byte** (p. 666), **decaf::lang::Character** (p. 803), **decaf::lang::Double** (p. 1233), **decaf::lang::Float** (p. 1330), **decaf::lang::Integer** (p. 1431), **decaf::lang::Long** (p. 1655), and **decaf::lang::Short** (p. 2323).

6.395.3.2 virtual double decaf::lang::Number::doubleValue () const [pure virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 667), **decaf::lang::Character** (p. 804), **decaf::lang::Double** (p. 1235), **decaf::lang::Float** (p. 1331), **decaf::lang::Integer** (p. 1432), **decaf::lang::Long** (p. 1656), **decaf::lang::Short** (p. 2324), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 493).

6.395.3.3 virtual float decaf::lang::Number::floatValue () const [pure virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 668), **decaf::lang::Character** (p. 804), **decaf::lang::Double** (p. 1236), **decaf::lang::Float** (p. 1333), **decaf::lang::Integer** (p. 1433), **decaf::lang::Long** (p. 1657), **decaf::lang::Short** (p. 2325), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 493).

6.395.3.4 virtual int decaf::lang::Number::intValue () const [pure virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 668), **decaf::lang::Character** (p. 805), **decaf::lang::Double** (p. 1236), **decaf::lang::Float** (p. 1333), **decaf::lang::Integer** (p. 1433), **decaf::lang::Long** (p. 1657), **decaf::lang::Short** (p. 2325), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 495).

6.395.3.5 virtual long long decaf::lang::Number::longValue () const [pure virtual]

Answers the long value which the receiver represents.

Returns:

long long the value of the receiver.

Implemented in `decaf::lang::Byte` (p. 668), `decaf::lang::Character` (p. 806), `decaf::lang::Double` (p. 1237), `decaf::lang::Float` (p. 1334), `decaf::lang::Integer` (p. 1434), `decaf::lang::Long` (p. 1658), `decaf::lang::Short` (p. 2325), and `decaf::util::concurrent::atomic::AtomicInteger` (p. 495).

6.395.3.6 virtual short decaf::lang::Number::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented in `decaf::lang::Byte` (p. 670), `decaf::lang::Character` (p. 807), `decaf::lang::Double` (p. 1239), `decaf::lang::Float` (p. 1336), `decaf::lang::Integer` (p. 1438), `decaf::lang::Long` (p. 1662), and `decaf::lang::Short` (p. 2327).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Number.h`

6.396.1 Constructor & Destructor Documentation

6.396.1.1 decaf::lang::exceptions::NumberFormatException::NumberFormatException () [inline]

Default Constructor.

Referenced by clone().

6.396.1.2 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.396.1.3 `decaf::lang::exceptions::NumberFormatException::NumberFormatException
(const NumberFormatException & ex) throw () [inline]`

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.396.1.4 `decaf::lang::exceptions::NumberFormatException::NumberFormatException
(const char * file, const int lineNumber, const std::exception * cause,
const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

References `decaf::lang::Exception::buildMessage()`, and `decaf::lang::Exception::setMark()`.

6.396.1.5 `decaf::lang::exceptions::NumberFormatException::NumberFormatException
(const std::exception * cause) throw () [inline]`

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.396.1.6 `decaf::lang::exceptions::NumberFormatException::NumberFormatException
(const char * file, const int lineNumber, const char * msg, ...) throw ()
[inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

References decaf::lang::Exception::buildMessage(), and decaf::lang::Exception::setMark().

6.396.1.7 virtual

decaf::lang::exceptions::NumberFormatException::~~NumberFormatException
() throw () [inline, virtual]

6.396.2 Member Function Documentation

6.396.2.1 virtual NumberFormatException* decaf::lang::exceptions::NumberFormatException::clone ()
const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1268) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

References NumberFormatException().

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NumberFormatException.h**

6.397 cms::ObjectMessage Class Reference

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

`#include <src/main/cms/ObjectMessage.h>`Inheritance diagram for cms::ObjectMessage:

Public Member Functions

- virtual `~ObjectMessage ()`

6.397.1 Detailed Description

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object. serialized `ObjectMessage` (p. 1960)s.

Since:

1.0

6.397.2 Constructor & Destructor Documentation

6.397.2.1 virtual cms::ObjectMessage::~ObjectMessage () [inline, virtual]

The documentation for this class was generated from the following file:

6.398 decaf::security_provider::unix::openssl::OpenSSLX500Principal Class Reference

The `OpenSSLX500Principal` (p. 1961) wraps around an OpenSSL `X509_NAME` structure.

```
#include <src/main/decaf/security_provider/unix/openssl/OpenSSLX500Principal.h>
```

Public Member Functions

- **OpenSSLX500Principal** (`X509_NAME *name`)
Constructor.
- virtual **~OpenSSLX500Principal** ()
Destructor.
- virtual `X509_NAME *getX509Name` ()
Accessor to the underlying X509 name structure.
- virtual `bool equals` (const `Principal &another`) const
Compares two principals to see if they are the same.
- virtual `std::string getName` () const
Returns the distinguished name string using the RFC2253 formatting.
- virtual `void getEncoded` (std::vector< unsigned char > &output) const
Serializes the distinguished name to its ASN.1 DER encoded form.

Static Public Member Functions

- static `void getEncoded` (`X509_NAME *name`, std::vector< unsigned char > &output)
Serializes the given distinguished name to its ASN.1 DER encoded form.
- static `std::string toString` (`X509_NAME *name`) const
Converts the given name to a string using the RFC2253 formatting.

6.398.1 Detailed Description

The `OpenSSLX500Principal` (p. 1961) wraps around an OpenSSL `X509_NAME` structure. It does not, however, control the lifetime of the structure.

6.398.2 Constructor & Destructor Documentation

6.398.2.1 decaf::security_provider::unix::openssl::OpenSSLX500Principal::OpenSSLX500Principal (`X509_NAME * name`)

Constructor. Saves the **internal** (p. 95) X509 name and caches the string representation of the name.

Parameters:

name The underlying X509 name structure.

6.398.2.2 `virtual decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::~~OpenSSLX500Principal
() [inline, virtual]`

Destructor. Does nothing.

6.398.3 Member Function Documentation

6.398.3.1 `virtual bool decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::equals
(const Principal & another) const [virtual]`

Compares two principals to see if they are the same.

Parameters:

another A principal to be tested for equality to this one.

Returns:

true if the given principal is equivalent to this one.

6.398.3.2 `static void decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::getEncoded
(X509_NAME * name, std::vector< unsigned char > & output)
[static]`

Serializes the given distinguished name to its ASN.1 DER encoded form.

Parameters:

name the X509 name structure to be encoded.

output Receives the distinguished name in ASN.1 DER encoded form.

6.398.3.3 `virtual void decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::getEncoded
(std::vector< unsigned char > & output) const [inline, virtual]`

Serializes the distinguished name to its ASN.1 DER encoded form.

Parameters:

output Receives the distinguished name in ASN.1 DER encoded form.

6.398.3.4 `virtual std::string decaf::security_provider::unix::openssl::OpenSSLX500Principal::getName()
() const [inline, virtual]`

Returns the distinguished name string using the RFC2253 formatting.

Returns:

the RFC2253 formatted distinguished name string.

References toString().

6.398.3.5 `virtual X509_NAME* decaf::security_provider::unix::openssl::OpenSSLX500Principal::getX509Name()
[inline, virtual]`

Accessor to the underlying X509 name structure.

6.398.3.6 `static std::string decaf::security_provider::unix::openssl::OpenSSLX500Principal::toString(
X509_NAME * name) const [static]`

Converts the given name to a string using the RFC2253 formatting.

Parameters:

name the X509 name structure to be formatted.

Returns:

the RFC2253 formatted name string.

Referenced by getName().

6.399.1 Constructor & Destructor Documentation

6.399.1.1 virtual decaf::security_provider::unix::openssl::OpenSSLX509Certificate::~~OpenSSLX509Certificate () [virtual]

6.399.2 Member Function Documentation

6.399.2.1 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::checkValidity (const decaf::util::Date & *date*) const throw (CertificateExpiredException, CertificateNotYetValidException) [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 2728).

6.399.2.2 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::checkValidity () const throw (CertificateExpiredException, CertificateNotYetValidException) [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 2729).

6.399.2.3 virtual bool decaf::security_provider::unix::openssl::OpenSSLX509Certificate::equals (const Certificate & *cert*) const [pure virtual]

Compares the encoded form of the two certificates.

Parameters:

cert The certificate to be tested for equality with this certificate.

Returns:

true if the given certificate is equal to this certificate.

6.399.2.4 `virtual int decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getBasicConstraints ()
const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2729).

6.399.2.5 `virtual void decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getEncoded
(std::vector< unsigned char > & output) const throw (
CertificateEncodingException) [pure virtual]`

Provides the encoded form of this certificate.

Parameters:

output Receives the encoded form of this certificate.

Exceptions:

CertificateEncodingException if an encoding error occurs

Implements `decaf::security::cert::Certificate` (p. 788).

6.399.2.6 `virtual void decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getIssuerUniqueID
(std::vector< bool > & output) const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2729).

6.399.2.7 `virtual const X500Principal* decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getIssuerX500Principal
() const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2729).

6.399.2.8 `virtual void decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getKeyUsage
(std::vector< unsigned char > & output) const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2729).

6.399.2.9 `virtual Date decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getNotAfter () const
[pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2729).

6.399.2.10 `virtual Date decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getNotBefore () const
[pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2729).

6.399.2.11 `virtual const PublicKey* decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getPublicKey () const [pure virtual]`

Gets the public key of this certificate.

Returns:

the public key

Implements `decaf::security::cert::Certificate` (p. 788).

6.399.2.12 `virtual PublicKey* decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getPublicKey () [pure virtual]`

Gets the public key of this certificate.

Returns:

the public key

Implements `decaf::security::cert::Certificate` (p. 788).

6.399.2.13 `virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgName () const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2729).

6.399.2.14 `virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgOID () const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2730).

6.399.2.15 `virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgParams (std::vector< unsigned char > & output) const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2730).

6.399.2.16 `virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSignature (std::vector< unsigned char > & output) const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2730).

6.399.2.17 `virtual void decaf::security_ -
provider::unix::openssl::OpenSSLX509Certificate::getSubjectUniqueID
(std::vector< bool > & output) const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2730).

6.399.2.18 `virtual const X500Principal* decaf::security_ -
provider::unix::openssl::OpenSSLX509Certificate::getSubjectX500Principal
() const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2730).

6.399.2.19 `virtual void decaf::security_ -
provider::unix::openssl::OpenSSLX509Certificate::getTBSCertificate
(std::vector< unsigned char > & output) const throw (
CertificateEncodingException) [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2730).

6.399.2.20 `virtual std::string decaf::security_ -
provider::unix::openssl::OpenSSLX509Certificate::getType () const
[pure virtual]`

Returns the type of this certificate.

Returns:

the type of this certificate

Implements `decaf::security::cert::Certificate` (p. 789).

6.399.2.21 `virtual int decaf::security_ -
provider::unix::openssl::OpenSSLX509Certificate::getVersion () const
[pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 2730).

6.399.2.22 `virtual std::string decaf::security_ -
provider::unix::openssl::OpenSSLX509Certificate::toString () const
[pure virtual]`

Returns a string representation of this certificate.

Returns:

a string representation of this certificate

Implements `decaf::security::cert::Certificate` (p. 789).

6.399.2.23 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::verify (const PublicKey & *publicKey*, const std::string & *sigProvider*) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key. Uses the verification engine of the specified provider.

Parameters:

publicKey The public key used to carry out the validation.

sigProvider The name of the signature provider

Exceptions:

NoSuchAlgorithmException - on unsupported signature algorithms.

InvalidKeyException - on incorrect key.

NoSuchProviderException - if there's no default provider.

SignatureException - on signature errors.

CertificateException - on encoding errors.

6.399.2.24 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::verify (const PublicKey & *publicKey*) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters:

publicKey The public key used to carry out the validation.

Exceptions:

NoSuchAlgorithmException - on unsupported signature algorithms.

InvalidKeyException - on incorrect key.

NoSuchProviderException - if there's no default provider.

SignatureException - on signature errors.

CertificateException - on encoding errors.

6.400 activemq::wireformat::openwire::OpenWireFormat Class Reference

#include <src/main/activemq/wireformat/openwire/OpenWireFormat.h> Inheritance diagram for activemq::wireformat::openwire::OpenWireFormat:

Public Member Functions

- **OpenWireFormat** (const **decaf::util::Properties** &properties)
*Constructs a new **OpenWireFormat** (p. 1970) object.*
- virtual **~OpenWireFormat** ()
- virtual bool **hasNegotiator** () const
*Returns true if this **WireFormat** (p. 2693) has a Negotiator that needs to wrap the Transport that uses it.*
- virtual **Pointer< transport::Transport > createNegotiator** (const **Pointer< transport::Transport >** &transport) throw (**decaf::lang::exceptions::UnsupportedOperationException**)
If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.
- void **addMarshaller** (**marshal::DataStreamMarshaller** *marshaller)
Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.
- virtual void **marshal** (const **Pointer< commands::Command >** &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out) throw (**decaf::io::IOException**)
Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer< commands::Command > unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in) throw (**decaf::io::IOException**)
Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form.
- virtual int **tightMarshalNestedObject1** (**commands::DataStructure** *object, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Utility method for Tight Marshaling the given object to the boolean stream passed.
- void **tightMarshalNestedObject2** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
*Utility method that will Tight **marshal** (p. 76) some internally nested object that implements the **DataStructure** interface.*

- **commands::DataStructure** * **tightUnmarshalNestedObject** (decaf::io::DataInputStream *dis, utils::BooleanStream *bs) throw (decaf::io::IOException)
Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.
- **commands::DataStructure** * **looseUnmarshalNestedObject** (decaf::io::DataInputStream *dis) throw (decaf::io::IOException)
Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.
- void **looseMarshalNestedObject** (commands::DataStructure *o, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)
Utility method to loosely Marshal an object that is derived from the DataStrcutre interface.
- void **renegotiateWireFormat** (const commands::WireFormatInfo &info) throw (decaf::lang::exceptions::IllegalStateException)
Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.
- virtual void **setPreferedWireFormatInfo** (const Pointer< commands::WireFormatInfo > &info) throw (decaf::lang::exceptions::IllegalStateException)
Configures this object using the provided WireformatInfo object.
- virtual const Pointer< commands::WireFormatInfo > & **getPreferedWireFormatInfo** () const
Gets the Preferred WireFormatInfo object that this class holds.
- bool **isStackTraceEnabled** () const
Checks if the stackTraceEnabled flag is on.
- void **setStackTraceEnabled** (bool stackTraceEnabled)
Sets if the stackTraceEnabled flag is on.
- bool **isTcpNoDelayEnabled** () const
Checks if the tcpNoDelayEnabled flag is on.
- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)
Sets if the tcpNoDelayEnabled flag is on.
- int **getVersion** () const
Get the current Wireformat Version.
- void **setVersion** (int version) throw (decaf::lang::exceptions::IllegalArgumentException)
Set the current Wireformat Version.
- bool **isCacheEnabled** () const
Checks if the cacheEnabled flag is on.
- void **setCacheEnabled** (bool cacheEnabled)

Sets if the cacheEnabled flag is on.

- **int getCacheSize () const**
Returns the currently set Cache size.
- **void setCacheSize (int value)**
Sets the current Cache size.
- **bool isTightEncodingEnabled () const**
Checks if the tightEncodingEnabled flag is on.
- **void setTightEncodingEnabled (bool tightEncodingEnabled)**
Sets if the tightEncodingEnabled flag is on.
- **bool isSizePrefixDisabled () const**
Checks if the sizePrefixDisabled flag is on.
- **void setSizePrefixDisabled (bool sizePrefixDisabled)**
Sets if the sizePrefixDisabled flag is on.
- **long long getMaxInactivityDuration () const**
Gets the MaxInactivityDuration setting.
- **void setMaxInactivityDuration (long long value)**
Sets the MaxInactivityDuration setting.
- **long long getMaxInactivityDurationInitialDelay () const**
Gets the MaxInactivityDurationInitialDelay setting.
- **void setMaxInactivityDurationInitialDelay (long long value)**
Sets the MaxInactivityDurationInitialDelay setting.

Protected Member Functions

- **commands::DataStructure * doUnmarshal (decaf::io::DataInputStream *dis)**
throw (decaf::io::IOException)
Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.
- **void destroyMarshallers ()**
Cleans up all registered Marshallers and empties the dataMarshallers vector.

Static Protected Attributes

- static const unsigned char **NULL__TYPE**
- static const int **DEFAULT__VERSION = 1**

6.400.1 Constructor & Destructor Documentation

6.400.1.1 activemq::wireformat::openwire::OpenWireFormat::OpenWireFormat (const decaf::util::Properties & *properties*)

Constructs a new **OpenWireFormat** (p. 1970) object.

Parameters:

properties - can contain optional config params.

6.400.1.2 virtual activemq::wireformat::openwire::OpenWireFormat::~~OpenWireFormat () [virtual]

6.400.2 Member Function Documentation

6.400.2.1 void activemq::wireformat::openwire::OpenWireFormat::addMarshaller (marshal::DataStreamMarshaller * *marshaller*)

Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.

Parameters:

marshaller - the Marshaler to add to the collection.

6.400.2.2 virtual Pointer<transport::Transport> activemq::wireformat::openwire::OpenWireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) throw (decaf::lang::exceptions::UnsupportedOperationException) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns:

new instance of a **WireFormatNegotiator** (p. 2721).

Implements **activemq::wireformat::WireFormat** (p. 2694).

6.400.2.3 void activemq::wireformat::openwire::OpenWireFormat::destroyMarshallers () [protected]

Cleans up all registered Marshallers and empties the dataMarshallers vector. This should be called before a reconfiguration of the version marshallers, or on destruction of this object

6.400.2.4 `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::doUnmarshal (decaf::io::DataInputStream * dis) throw (decaf::io::IOException)`
[protected]

Perform the actual unmarshal of data from the given `DataInputStream` return the unmarshalled `DataStructure` object once done, caller takes ownership of this object. This method can return null if the type of the object to unmarshal is NULL, empty data.

Parameters:

dis - `DataInputStream` to read from

Returns:

new `DataStructure*` that the caller owns

Exceptions:

IOException if an error occurs during the unmarshal

6.400.2.5 `int activemq::wireformat::openwire::OpenWireFormat::getCacheSize ()`
`const` [inline]

Returns the currently set Cache size.

Returns:

the current value of the broker's cache size.

6.400.2.6 `long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDuration ()`
`const` [inline]

Gets the `MaxInactivityDuration` setting.

Returns:

maximum inactivity duration value in milliseconds.

6.400.2.7 `long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDurationInitialDelay ()`
`const` [inline]

Gets the `MaxInactivityDurationInitialDelay` setting.

Returns:

maximum inactivity duration initial delay value in milliseconds.

6.400.2.8 `virtual const Pointer<commands::WireFormatInfo>& activemq::wireformat::openwire::OpenWireFormat::getPreferredWireFormatInfo () const [inline, virtual]`

Gets the Preferred WireFormatInfo object that this class holds.

Returns:

pointer to a preferred WireFormatInfo object

6.400.2.9 `int activemq::wireformat::openwire::OpenWireFormat::getVersion () const [inline, virtual]`

Get the current Wireformat Version.

Returns:

int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 2694).

6.400.2.10 `virtual bool activemq::wireformat::openwire::OpenWireFormat::hasNegotiator () const [inline, virtual]`

Returns true if this **WireFormat** (p. 2693) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 2693) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2694).

6.400.2.11 `bool activemq::wireformat::openwire::OpenWireFormat::isCacheEnabled () const [inline]`

Checks if the cacheEnabled flag is on.

Returns:

true if the flag is on.

6.400.2.12 `bool activemq::wireformat::openwire::OpenWireFormat::isSizePrefixDisabled () const [inline]`

Checks if the sizePrefixDisabled flag is on.

Returns:

true if the flag is on.

6.400.2.13 `bool activemq::wireformat::openwire::OpenWireFormat::isStackTraceEnabled() const [inline]`

Checks if the `stackTraceEnabled` flag is on.

Returns:

true if the flag is on.

6.400.2.14 `bool activemq::wireformat::openwire::OpenWireFormat::isTcpNoDelayEnabled() const [inline]`

Checks if the `tcpNoDelayEnabled` flag is on.

Returns:

true if the flag is on.

6.400.2.15 `bool activemq::wireformat::openwire::OpenWireFormat::isTightEncodingEnabled() const [inline]`

Checks if the `tightEncodingEnabled` flag is on.

Returns:

true if the flag is on.

6.400.2.16 `void activemq::wireformat::openwire::OpenWireFormat::looseMarshalNestedObject(commands::DataStructure * o, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`

Utility method to loosely Marshal an object that is derived from the `DataStructure` interface. The marshaled data is written to the passed in `DataOutputStream`.

Parameters:

o - `DataStructure` derived Object to Marshal
dataOut - `DataOutputStream` to write the data to

Exceptions:

IOException if an error occurs.

6.400.2.17 `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::looseUnmarshalNestedObject(decaf::io::DataInputStream * dis) throw (decaf::io::IOException)`

Utility method to unmarshal a `DataStructure` object from an `DataInputStream` using the Loose Unmarshaling format. Will read the Data and construct a new `DataStructure` based Object, the pointer to the Object returned is now owned by the caller.

Parameters:

dis - the DataInputStream to read the data from

Returns:

a new DataStructure derived Object pointer

Exceptions:

IOException if an error occurs.

6.400.2.18 `virtual void activemq::wireformat::openwire::OpenWireFormat::marshal
(const Pointer< commands::Command > & command,
const activemq::transport::Transport * transport,
decaf::io::DataOutputStream * out) throw (decaf::io::IOException)
[virtual]`

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal.

transport (p. 67) The Transport instance that called this method.

out The output stream to write the command to.

Exceptions:

IOException

Implements `activemq::wireformat::WireFormat` (p. 2695).

6.400.2.19 `void ac-
tivemq::wireformat::openwire::OpenWireFormat::renegotiateWireFormat
(const commands::WireFormatInfo & info) throw (de-
caf::lang::exceptions::IllegalStateException)`

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

Parameters:

info - The new Wireformat Info settings

Exceptions:

IllegalStateException is wire format can't be negotiated.

6.400.2.20 `void ac-
tivemq::wireformat::openwire::OpenWireFormat::setCacheEnabled (bool
cacheEnabled) [inline]`

Sets if the cacheEnabled flag is on.

Parameters:

cacheEnabled - true to turn flag is on

6.400.2.21 `void activemq::wireformat::openwire::OpenWireFormat::setCacheSize
(int value) [inline]`

Sets the current Cache size.

Parameters:

value - the value to send as the broker's cache size.

6.400.2.22 `void ac-
tivemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDuration
(long long value) [inline]`

Sets the MaxInactivityDuration setting.

Parameters:

value - the Max inactivity duration value in milliseconds.

6.400.2.23 `void ac-
tivemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDurationInitialDelay
(long long value) [inline]`

Sets the MaxInactivityDurationInitialDelay setting.

Parameters:

value - the Max inactivity Initial Delay duration value in milliseconds.

6.400.2.24 `virtual void ac-
tivemq::wireformat::openwire::OpenWireFormat::setPreferredWireFormatInfo
(const Pointer< commands::WireFormatInfo > & info) throw (
decaf::lang::exceptions::IllegalStateException) [virtual]`

Configures this object using the provided WireFormatInfo object.

Parameters:

info - a WireFormatInfo object, takes ownership.

6.400.2.25 `void ac-
tivemq::wireformat::openwire::OpenWireFormat::setSizePrefixDisabled
(bool sizePrefixDisabled) [inline]`

Sets if the sizePrefixDisabled flag is on.

Parameters:

sizePrefixDisabled - true to turn flag is on

6.400.2.26 void `activemq::wireformat::openwire::OpenWireFormat::setStackTraceEnabled` (bool *stackTraceEnabled*) [inline]

Sets if the `stackTraceEnabled` flag is on.

Parameters:

stackTraceEnabled - true to turn flag is on

6.400.2.27 void `activemq::wireformat::openwire::OpenWireFormat::setTcpNoDelayEnabled` (bool *tcpNoDelayEnabled*) [inline]

Sets if the `tcpNoDelayEnabled` flag is on.

Parameters:

tcpNoDelayEnabled - true to turn flag is on

6.400.2.28 void `activemq::wireformat::openwire::OpenWireFormat::setTightEncodingEnabled` (bool *tightEncodingEnabled*) [inline]

Sets if the `tightEncodingEnabled` flag is on.

Parameters:

tightEncodingEnabled - true to turn flag is on

6.400.2.29 void `activemq::wireformat::openwire::OpenWireFormat::setVersion` (int *version*) throw (`decaf::lang::exceptions::IllegalArgumentException`) [virtual]

Set the current Wireformat Version.

Parameters:

version - int that identifies the version

Implements `activemq::wireformat::WireFormat` (p. 2695).

6.400.2.30 virtual int `activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject1` (`commands::DataStructure` * *object*, `utils::BooleanStream` * *bs*) throw (`decaf::io::IOException`) [virtual]

Utility method for Tight Marshaling the given object to the boolean stream passed.

Parameters:

object - The DataStructure to `marshal` (p. 76)

bs - the BooleanStream to write to

Returns:

size of the data returned.

6.400.2.31 `void activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject2 (commands::DataStructure * o, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs) throw (decaf::io::IOException)`

Utility method that will Tight **marshal** (p. 76) some internally nested object that implements the DataStructure interface. Writes the data to the Data Output Stream provided.

Parameters:

o - DataStructure object
ds - DataOutputStream for writing
bs - BooleanStream

Exceptions:

IOException if an error occurs.

6.400.2.32 `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::tightUnmarshalNestedObject (decaf::io::DataInputStream * dis, utils::BooleanStream * bs) throw (decaf::io::IOException)`

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream. The DataStructure instance that is returned is now the property of the caller.

Parameters:

dis - DataInputStream to read from
bs - BooleanStream to read from

Returns:

Newly allocated DataStructure Object

Exceptions:

IOException if an error occurs.

6.400.2.33 `virtual Pointer<commands::Command> activemq::wireformat::openwire::OpenWireFormat::unmarshal (const activemq::transport::Transport * transport, decaf::io::DataInputStream * in) throw (decaf::io::IOException) [virtual]`

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form. Returns a Pointer to the newly un-marshaled Command.

Parameters:

transport (p. 67) - Pointer to the **transport** (p. 67) that is making this request.
in - the input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException

Implements **activemq::wireformat::WireFormat** (p. 2695).

6.400.3 Field Documentation

6.400.3.1 `const int`
`activemq::wireformat::openwire::OpenWireFormat::DEFAULT_`
`VERSION = 1` [static, protected]

6.401 activemq::wireformat::openwire::OpenWireFormatFactory Class Reference

#include <src/main/activemq/wireformat/openwire/OpenWireFormatFactory.h> Inheritance diagram for activemq::wireformat::openwire::OpenWireFormatFactory:

Public Member Functions

- **OpenWireFormatFactory ()**

Constructor - Sets Defaults for all properties, these are all subject to change once the `createWireFormat` method is called.

- virtual **~OpenWireFormatFactory ()**

- virtual **Pointer< wireformat::WireFormat > createWireFormat (const decaf::util::Properties &properties) throw (decaf::lang::exceptions::IllegalStateException)**

*Creates a new **WireFormat** (p. 2693) Object passing it a set of properties from which it can obtain any optional settings.*

6.401.1 Constructor & Destructor Documentation

6.401.1.1 activemq::wireformat::openwire::OpenWireFormatFactory::OpenWireFormatFactory () [inline]

Constructor - Sets Defaults for all properties, these are all subject to change once the `createWireFormat` method is called. URL options ----- wireFormat.stackTraceEnabled wireFormat.cacheEnabled wireFormat.tcpNoDelayEnabled wireFormat.tightEncodingEnabled wireFormat.sizePrefixDisabled wireFormat.maxInactivityDuration wireFormat.maxInactivityDurationInitialDelay

6.401.1.2 virtual activemq::wireformat::openwire::OpenWireFormatFactory::~~OpenWireFormatFactory () [inline, virtual]

6.401.2 Member Function Documentation

6.401.2.1 virtual Pointer<wireformat::WireFormat> activemq::wireformat::openwire::OpenWireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) throw (decaf::lang::exceptions::IllegalStateException) [virtual]

Creates a new **WireFormat** (p. 2693) Object passing it a set of properties from which it can obtain any optional settings.

Parameters:

properties - the Properties for this **WireFormat** (p. 2693)

Implements **activemq::wireformat::WireFormatFactory** (p. 2697).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireFormatFactory.h`

6.402 activemq::wireformat::openwire::OpenWireFormatNegotiator Class Reference

#include <src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h> Inheritance diagram for activemq::wireformat::openwire::OpenWireFormatNegotiator:

Public Member Functions

- **OpenWireFormatNegotiator** (**OpenWireFormat** *wireFormat, const **Pointer**< **transport::Transport** > &next)
Constructor - Initializes this object around another Transport.
- virtual **~OpenWireFormatNegotiator** ()
- virtual void **oneway** (const **Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends a one-way command.
- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given request to the server and waits for the response.
- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given request to the server and waits for the response.
- virtual void **onCommand** (const **Pointer**< **commands::Command** > &command)
This is called in the context of the nested transport's reading thread.
- virtual void **onTransportException** (**transport::Transport** *source, const **decaf::lang::Exception** &ex)
*Event handler for an exception from a command **transport** (p. 67).*
- virtual void **start** () throw (cms::CMSException)
*Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59).*
- virtual void **close** () throw (cms::CMSException)
Stops the polling thread and closes the streams.

6.402.1 Constructor & Destructor Documentation

6.402.1.1 activemq::wireformat::openwire::OpenWireFormatNegotiator::OpenWireFormatNegotiator (**OpenWireFormat** * wireFormat, const **Pointer**< **transport::Transport** > & next)

Constructor - Initializes this object around another Transport.

Parameters:

wireFormat - The **WireFormat** (p. 2693) object we use to negotiate
next - The next **transport** (p. 67) in the chain

6.402.1.2 virtual
activemq::wireformat::openwire::OpenWireFormatNegotiator::~~OpenWireFormatNegotiator()
[virtual]

6.402.2 Member Function Documentation

6.402.2.1 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::close()
throw (cms::CMSException) [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

CMSException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 2618).

6.402.2.2 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onCommand(
const Pointer< commands::Command > & *command*) [virtual]

This is called in the context of the nested transport's reading thread. In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters:

command the received from the nested **transport** (p. 67).

Reimplemented from **activemq::transport::TransportFilter** (p. 2620).

6.402.2.3 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::oneway(
const Pointer< commands::Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
[virtual]

Sends a one-way command. Does not wait for any response from the broker. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this **transport** (p. 67).

Reimplemented from **activemq::transport::TransportFilter** (p. 2620).

6.402.2.4 `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onTransportException (transport::Transport * source, const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command **transport** (p. 67).

Parameters:

source The source of the exception
ex The exception.

6.402.2.5 `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given request to the server and waits for the response. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters:

command The request to send.
timeout The time to wait for the response.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 2621).

6.402.2.6 `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given request to the server and waits for the response. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters:

command The request to send.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 2622).

6.402.2.7 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::start () throw (cms::CMSException) [virtual]

Starts this **transport** (p. 67) object and creates the thread for polling on the input stream for **commands** (p. 59). If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

CMSException if an error occurs or if this **transport** (p. 67) has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 2622).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h

6.403 activemq::wireformat::openwire::OpenWireResponseBuilder Class Reference

#include <src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h> Inheritance diagram for activemq::wireformat::openwire::OpenWireResponseBuilder:

Public Member Functions

- **OpenWireResponseBuilder** ()
- virtual **~OpenWireResponseBuilder** ()
- virtual **Pointer< commands::Response > buildResponse** (const **Pointer< commands::Command > &command**)

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

- virtual void **buildIncomingCommands** (const **Pointer< commands::Command > &command**, **decaf::util::StlQueue< Pointer< commands::Command > > &queue**)

*When called the ResponseBuilder must construct all the Responses or Asynchronous **commands** (p. 59) that would be sent to this client by the Broker upon receipt of the passed command.*

6.403.1 Constructor & Destructor Documentation

6.403.1.1 **activemq::wireformat::openwire::OpenWireResponseBuilder::OpenWireResponseBuilder** () [inline]

6.403.1.2 **virtual** **activemq::wireformat::openwire::OpenWireResponseBuilder::~~OpenWireResponseBuilder** () [inline, virtual]

6.403.2 Member Function Documentation

6.403.2.1 **virtual void** **activemq::wireformat::openwire::OpenWireResponseBuilder::buildIncomingCommands** (const **Pointer< commands::Command > & command**, **decaf::util::StlQueue< Pointer< commands::Command > > & queue**) [virtual]

When called the ResponseBuilder must construct all the Responses or Asynchronous **commands** (p. 59) that would be sent to this client by the Broker upon receipt of the passed command.

Parameters:

command - The Command being sent to the Broker.

queue - Queue of Command sent back from the broker.

Implements **activemq::transport::mock::ResponseBuilder** (p. 2235).

6.403.2.2 `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireResponseBuilder::buildResponse(const Pointer< commands::Command > & command) [virtual]`

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters:

command - The command to build a response for

Returns:

A Response object pointer, or NULL if no response.

Implements **activemq::transport::mock::ResponseBuilder** (p. 2236).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h`

6.404 activemq::wireformat::openwire::utils::OpenwireStringSupport Class Reference

```
#include <src/main/activemq/wireformat/openwire/utils/OpenwireStringSupport.h>
```

Static Public Member Functions

- static std::string **readString** (decaf::io::DataInputStream &dataIn) throw (decaf::io::IOException)

Static method used for reading a string that uses the Openwire format from a DataInputStream, this can throw an IOException for the same reason as a DataInputStream.readUTF might, as well as if the string that is received doesn't conform to the supported character encoding.

- static void **writeString** (decaf::io::DataOutputStream &dataOut, const std::string *str) throw (decaf::io::IOException)

Static method used for writing a string that uses the Openwire format from a DataOutputStream, this can throw an IOException for the same reason as a DataOutputStream.writeUTF might.

Protected Member Functions

- OpenwireStringSupport ()
- virtual ~OpenwireStringSupport ()

6.404.1 Constructor & Destructor Documentation

6.404.1.2 **virtual**
activemq::wireformat::openwire::utils::OpenwireStringSupport::~~OpenwireStringSupport () [inline, protected, virtual]

6.404.2 Member Function Documentation

6.404.2.1 **static std::string** **activemq::wireformat::openwire::utils::OpenwireStringSupport::readString** (decaf::io::DataInputStream & *dataIn*) throw (decaf::io::IOException) [static]

Static method used for reading a string that uses the Openwire format from a DataInputStream, this can throw an IOException for the same reason as a DataInputStream.readUTF might, as well as if the string that is received doesn't conform to the supported character encoding.

Parameters:

dataIn - DataInputStream to read from

Returns:

A string that has been read

Exceptions:

IOException on Error.

6.404.2.2 static void activemq::wireformat::openwire::utils::OpenwireStringSupport::writeString (decaf::io::DataOutputStream & *dataOut*, const std::string * *str*) throw (decaf::io::IOException) [static]

Static method used for writing a string that uses the Openwire format from a DataOutputStream, this can throw an IOException for the same reason as a DataOutputStream.writeUTF might.

Parameters:

dataOut - DataOutputStream to write to

str - A pointer to a string that should be written, NULL needs to be an option here as its written as -1.

Exceptions:

IOException on Error.

6.405 decaf::io::OutputStream Class Reference

Base interface for an output stream.

#include <src/main/decaf/io/OutputStream.h> Inheritance diagram for decaf::io::OutputStream:

Public Member Functions

- virtual **~OutputStream** ()
- virtual void **write** (unsigned char c)=0 throw (IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer)=0 throw (IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len)=0 throw (IOException, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** ()=0 throw (IOException)
Flushes any pending writes in this output stream.

6.405.1 Detailed Description

Base interface for an output stream.

6.405.2 Constructor & Destructor Documentation

6.405.2.1 virtual decaf::io::OutputStream::~~OutputStream () [inline, virtual]

6.405.3 Member Function Documentation

6.405.3.1 virtual void decaf::io::OutputStream::flush () throw (IOException)
[pure virtual]

Flushes any pending writes in this output stream.

Exceptions:

IOException (p. 1477)

Implemented in **decaf::internal::io::StandardErrorOutputStream** (p. 2400), **decaf::internal::io::StandardOutputStream** (p. 2410), **decaf::io::BufferedOutputStream** (p. 639), **decaf::io::ByteArrayOutputStream** (p. 725), **decaf::io::FilterOutputStream** (p. 1324), and **decaf::net::SocketOutputStream** (p. 2391).

6.405.3.2 virtual void decaf::io::OutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [pure virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implemented in `activemq:io::LoggingOutputStream` (p. 1635), `decaf::internal::io::StandardErrorOutputStream` (p. 2401), `decaf::internal::io::StandardOutputStream` (p. 2411), `decaf::io::BufferedOutputStream` (p. 639), `decaf::io::ByteArrayOutputStream` (p. 727), `decaf::io::DataOutputStream` (p. 1127), `decaf::io::FilterOutputStream` (p. 1326), and `decaf::net::SocketOutputStream` (p. 2393).

6.405.3.3 virtual void decaf::io::OutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [pure virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implemented in `decaf::internal::io::StandardErrorOutputStream` (p. 2402), `decaf::internal::io::StandardOutputStream` (p. 2412), `decaf::io::BufferedOutputStream` (p. 640), `decaf::io::ByteArrayOutputStream` (p. 727), `decaf::io::DataOutputStream` (p. 1127), `decaf::io::FilterOutputStream` (p. 1326), and `decaf::net::SocketOutputStream` (p. 2393).

6.405.3.4 virtual void decaf::io::OutputStream::write (unsigned char *c*) throw (IOException) [pure virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implemented in `activemq::io::LoggingOutputStream` (p. 1636), `decaf::internal::io::StandardErrorOutputStream` (p. 2402), `decaf::internal::io::StandardOutputStream` (p. 2412), `decaf::io::BufferedOutputStream` (p. 640), `decaf::io::ByteArrayOutputStream` (p. 728), `decaf::io::DataOutputStream` (p. 1127), `decaf::io::FilterOutputStream` (p. 1327), and `decaf::net::SocketOutputStream` (p. 2393).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/OutputStream.h`

6.406 activemq::commands::PartialCommand Class Reference

#include <src/main/activemq/commands/PartialCommand.h> Inheritance diagram for activemq::commands::PartialCommand:

Public Member Functions

- **PartialCommand** ()
- virtual **~PartialCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **PartialCommand** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const

- 6.406.1.3** `virtual activemq::commands::PartialCommand::~~PartialCommand () [virtual]`

6.406.2 Member Function Documentation

- 6.406.2.1** `virtual PartialCommand* activemq::commands::PartialCommand::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

Reimplemented in `activemq::commands::LastPartialCommand` (p. 1576).

- 6.406.2.2** `virtual void activemq::commands::PartialCommand::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented in `activemq::commands::LastPartialCommand` (p. 1576).

- 6.406.2.3** `virtual bool activemq::commands::PartialCommand::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented in `activemq::commands::LastPartialCommand` (p. 1576).

- 6.406.2.4** `virtual int activemq::commands::PartialCommand::getCommandId () const [virtual]`
- 6.406.2.5** `virtual std::vector<unsigned char>& activemq::commands::PartialCommand::getData () [virtual]`

- 6.406.2.7** `virtual unsigned char activemq::commands::PartialCommand::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1577).

- 6.406.2.8** `PartialCommand& activemq::commands::PartialCommand::operator= (const PartialCommand &) [inline, protected]`

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1577).

- 6.406.2.9** `virtual void activemq::commands::PartialCommand::setCommandId (int commandId) [virtual]`
- 6.406.2.10** `virtual void activemq::commands::PartialCommand::setData (const std::vector< unsigned char > & data) [virtual]`
- 6.406.2.11** `virtual std::string activemq::commands::PartialCommand::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 560).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1577).

6.406.3 Field Documentation

6.407 activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p.1999).

#include <src/main/activemq/wireformat/openwire/marshal/v2/PartialCommandMarshaller.h>Inheritance
diagram for activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller:

Public Member Functions

- **PartialCommandMarshaller** ()
- virtual **~PartialCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.407.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p.1999). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.407.2 Constructor & Destructor Documentation

6.407.2.1 `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::PartialCommandMarshaller()` [inline]

6.407.2.2 `virtual activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::~~PartialCommandMarshaller()` [inline, virtual]

6.407.3 Member Function Documentation

6.407.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 1587).

6.407.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 1587).

6.407.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1587).

6.407.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1588).

6.407.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal1
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, utils::BooleanStream * *bs*) throw (decaf::io::IOException
) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1588).

6.407.3.6 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1589).

6.407.3.7 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1589).

The documentation for this class was generated from the following file:

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2003). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.408.2 Constructor & Destructor Documentation

6.408.2.1 `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::PartialCommandMarshaller()` [inline]

6.408.2.2 `virtual activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::~~PartialCommandMarshaller()` [inline, virtual]

6.408.3 Member Function Documentation

6.408.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1579).

6.408.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1579).

6.408.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1579).

6.408.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1580).

6.408.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal1
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, utils::BooleanStream * *bs*) throw (decaf::io::IOException
) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1580).

6.408.3.6 virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1581).

6.408.3.7 virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1581).

6.409.3 Member Function Documentation

6.409.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 1583).

6.409.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller` (p. 1583).

6.409.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 1583).

6.409.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::looseUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure
* *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 1584).

6.409.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightMarshal1
(OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, utils::BooleanStream * *bs*) throw (decaf::io::IOException
) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 1584).

6.409.3.6 virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 1585).

6.409.3.7 virtual void activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller** (p. 1585).

- `bool operator!= (const T *left, const Pointer &right)`

6.410.1 Detailed Description

`template<typename T, typename REFCOUNTER = AtomicRefCounter> class`
`decaf::lang::Pointer< T, REFCOUNTER >`

Decaf's implementation of a Smart **Pointer** (p. 2011) that is a template on a Type and is **Thread** (p. 2544) Safe if the default Reference Counter is used. This **Pointer** (p. 2011) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of **ReferenceCounter**.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2011) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 2011) in a STL container that requires it, **Pointer** (p. 2011) provides an implementation of std::less.

Since:

1.0

6.410.2 Member Typedef Documentation

- 6.410.2.1** `template<typename T, typename REFCOUNTER = AtomicRefCount> typedef REFCOUNTER decaf::lang::Pointer< T, REFCOUNTER >::CounterType`
- 6.410.2.2** `template<typename T, typename REFCOUNTER = AtomicRefCount> typedef T* decaf::lang::Pointer< T, REFCOUNTER >::PointerType`
- 6.410.2.3** `template<typename T, typename REFCOUNTER = AtomicRefCount> typedef T& decaf::lang::Pointer< T, REFCOUNTER >::ReferenceType`

6.410.3 Constructor & Destructor Documentation

- 6.410.3.1** `template<typename T, typename REFCOUNTER = AtomicRefCount> decaf::lang::Pointer< T, REFCOUNTER >::Pointer () [inline]`

Default Constructor. Initialized the contained pointer to NULL, using the -> operator results in an exception unless reset to contain a real value.

Referenced by `decaf::lang::Pointer< TransactionId >::reset()`.

- 6.410.3.2** `template<typename T, typename REFCOUNTER = AtomicRefCount> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const PointerType value) [inline, explicit]`

Explicit Constructor, creates a **Pointer** (p. 2011) that contains value with a single reference. This object now has ownership until a call to release.

Parameters:

value - instance of the type we are containing here.

- 6.410.3.3** `template<typename T, typename REFCOUNTER = AtomicRefCount> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T, REFCOUNTER > & value) throw () [inline]`

Copy constructor. Copies the value contained in the pointer to the new instance and increments the reference counter.

- 6.410.3.4** `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & value) throw () [inline]`

Copy constructor. Copies the value contained in the pointer to the new instance and increments the reference counter.

```

6.410.3.5  template<typename T, typename REFCOUNTER =
           AtomicRefCount> template<typename T1 , typename R1 >
           decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1,
           R1 > & value, const STATIC_CAST_TOKEN &) throw () [inline]

```

Static Cast constructor. Copies the value contained in the pointer to the new instance and increments the reference counter performing a static cast on the value contained in the source **Pointer** (p.2011) object.

Parameters:

value - **Pointer** (p.2011) instance to cast to this type.

```

6.410.3.6  template<typename T, typename REFCOUNTER =
           AtomicRefCount> template<typename T1 , typename R1 >
           decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer<
           T1, R1 > & value, const DYNAMIC_CAST_TOKEN &) throw (
           decaf::lang::exceptions::ClassCastException ) [inline]

```

Dynamic Cast constructor. Copies the value contained in the pointer to the new instance and increments the reference counter performing a dynamic cast on the value contained in the source **Pointer** (p.2011) object. If the cast fails and return NULL then this method throws a **ClassCastException**.

Parameters:

value - **Pointer** (p.2011) instance to cast to this type.

Exceptions:

ClassCastException if the dynamic cast returns NULL

```

6.410.3.7  template<typename T, typename REFCOUNTER =
           AtomicRefCount> virtual decaf::lang::Pointer< T, REFCOUNTER
           >::~Pointer () throw () [inline, virtual]

```

6.410.4 Member Function Documentation

```

6.410.4.1  template<typename T, typename REFCOUNTER =
           AtomicRefCount> template<typename T1 > Pointer<T1,
           CounterType> decaf::lang::Pointer< T, REFCOUNTER >::dynamicCast
           () const [inline]

```

```

6.410.4.2  template<typename T, typename REFCOUNTER =
           AtomicRefCount> PointerType decaf::lang::Pointer< T,
           REFCOUNTER >::get () const [inline]

```

Gets the real pointer that is contained within this **Pointer** (p.2011). This is not really safe since the caller could delete or alter the pointer but it mimics the STL `auto_ptr` and gives access in cases where the caller absolutely needs the real **Pointer** (p.2011). Use at your own risk.

Returns:

the contained pointer.

Referenced by activemq::core::ActiveMQConnectionSupport::getProperties(), activemq::core::ActiveMQConnectionSupport::getTransport(), decaf::lang::operator!=(), decaf::lang::Pointer< TransactionId >::operator!=(), std::less< decaf::lang::Pointer< T > >::operator()(), decaf::lang::operator==(), decaf::lang::Pointer< TransactionId >::operator==(), and activemq::state::ConnectionState::removeTempDestination().

6.410.4.3 `template<typename T, typename REFCOUNTER = AtomicRefCount> bool decaf::lang::Pointer< T, REFCOUNTER >::operator! () const [inline]`

6.410.4.4 `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1, typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator!= (const Pointer< T1, R1 > & right) const [inline]`

6.410.4.5 `template<typename T, typename REFCOUNTER = AtomicRefCount> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* () const [inline]`

6.410.4.6 `template<typename T, typename REFCOUNTER = AtomicRefCount> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* () [inline]`

Dereference Operator, returns a reference to the Contained value. This method throws an `NullPointerException` if the contained value is `NULL`.

Returns:

reference to the contained pointer.

Exceptions:

NullPointerException if the contained value is `Null`

6.410.4.7 `template<typename T, typename REFCOUNTER = AtomicRefCount> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> () const [inline]`

6.410.4.8 `template<typename T, typename REFCOUNTER = AtomicRefCount> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> () [inline]`

Indirection Operator, returns a pointer to the Contained value. This method throws an `NullPointerException` if the contained value is `NULL`.

Returns:

reference to the contained pointer.

Exceptions:

NullPointerException if the contained value is Null

6.410.4.9 `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1, typename R1 > Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T1, R1 > & right) throw () [inline]`

6.410.4.10 `template<typename T, typename REFCOUNTER = AtomicRefCount> Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T, REFCOUNTER > & right) throw () [inline]`

Assigns the value of *right* to this **Pointer** (p.2011) and increments the reference Count.

Parameters:

right - **Pointer** (p.2011) on the right hand side of an operator= call to this.

6.410.4.11 `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1, typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator== (const Pointer< T1, R1 > & right) const [inline]`

6.410.4.12 `template<typename T, typename REFCOUNTER = AtomicRefCount> void decaf::lang::Pointer< T, REFCOUNTER >::reset (T * value) [inline]`

Resets the **Pointer** (p.2011) to hold the new value. Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p.2011) to a NULL pointer.

Parameters:

value - The new value to contain.

6.410.4.13 `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::staticCast () const [inline]`

6.410.4.14 `template<typename T, typename REFCOUNTER = AtomicRefCount> void decaf::lang::Pointer< T, REFCOUNTER >::swap (Pointer< T, REFCOUNTER > & value) throw () [inline]`

Exception (p.1268) Safe Swap Function.

Parameters:

value - the value to swap with this.

Referenced by decaf::lang::Pointer< TransactionId >::operator=(), and decaf::lang::Pointer< TransactionId >::swap().

6.410.5 Friends And Related Function Documentation

6.411 decaf::lang::PointerComparator< T, R > Class Template Reference

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2011) instance.

#include <src/main/decaf/lang/Pointer.h> Inheritance diagram for decaf::lang::PointerComparator< T, R >:

Public Member Functions

- virtual bool **operator()** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const
- virtual int **compare** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const

6.411.1 Detailed Description

```
template<typename T, typename R = AtomicRefCounter> class
decaf::lang::PointerComparator< T, R >
```

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2011) instance. This can be useful in the case where a series of values in a Collection is more efficiently accessed in the Objects Natural Order and not the underlying pointers location in memory.

Also this allows **Pointer** (p. 2011) objects that Point to different instances of the same type to be compared based on the comparison of the object itself and not just the value of the pointer.

6.411.2 Member Function Documentation

6.411.2.1 template<typename T , typename R = AtomicRefCounter> virtual int decaf::lang::PointerComparator< T, R >::compare (const **Pointer**< T, R > & *left*, const **Pointer**< T, R > & *right*) const [inline, virtual]

6.411.2.2 template<typename T , typename R = AtomicRefCounter> virtual bool decaf::lang::PointerComparator< T, R >::operator() (const **Pointer**< T, R > & *left*, const **Pointer**< T, R > & *right*) const [inline, virtual]

6.412 activemq::cmsutil::PooledSession Class Reference

A pooled session object that wraps around a delegate session.

#include <src/main/activemq/cmsutil/PooledSession.h> Inheritance diagram for activemq::cmsutil::PooledSession:

Public Member Functions

- **PooledSession** (SessionPool *pool, cms::Session *session)
- virtual ~**PooledSession** ()
Does nothing.
- virtual cms::Session * **getSession** ()
Returns a non-constant reference to the internal session object.
- virtual const cms::Session * **getSession** () const
Returns a constant reference to the internal session object.
- virtual void **close** () throw (cms::CMSEException)
Returns this session back to the pool, but does not close or destroy the internal session object.
- virtual void **commit** () throw (cms::CMSEException)
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** () throw (cms::CMSEException)
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** () throw (cms::CMSEException)
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual cms::MessageConsumer * **createConsumer** (const cms::Destination *destination) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination.
- virtual cms::MessageConsumer * **createConsumer** (const cms::Destination *destination, const std::string &selector) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual cms::MessageConsumer * **createConsumer** (const cms::Destination *destination, const std::string &selector, bool noLocal) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual cms::MessageConsumer * **createDurableConsumer** (const cms::Topic *destination, const std::string &name, const std::string &selector, bool noLocal=false) throw (cms::CMSEException)
Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageConsumer** * **createCachedConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal) throw (cms::CMSEException)
First checks the internal consumer cache and creates one if none exist for the given destination, selector, noLocal.
- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination) throw (cms::CMSEException)
Creates a MessageProducer to send messages to the specified destination.
- virtual **cms::MessageProducer** * **createCachedProducer** (const **cms::Destination** *destination) throw (cms::CMSEException)
First checks the internal producer cache and creates one if none exist for the given destination.
- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue) throw (cms::CMSEException)
Creates a new QueueBrowser to peek at Messages on the given Queue.
- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector) throw (cms::CMSEException)
Creates a new QueueBrowser to peek at Messages on the given Queue.
- virtual **cms::Queue** * **createQueue** (const std::string &queueName) throw (cms::CMSEException)
Creates a queue identity given a Queue name.
- virtual **cms::Topic** * **createTopic** (const std::string &topicName) throw (cms::CMSEException)
Creates a topic identity given a Queue name.
- virtual **cms::TemporaryQueue** * **createTemporaryQueue** () throw (cms::CMSEException)
Creates a TemporaryQueue object.
- virtual **cms::TemporaryTopic** * **createTemporaryTopic** () throw (cms::CMSEException)
Creates a TemporaryTopic object.
- virtual **cms::Message** * **createMessage** () throw (cms::CMSEException)
Creates a new Message.
- virtual **cms::BytesMessage** * **createBytesMessage** () throw (cms::CMSEException)
Creates a BytesMessage.
- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, std::size_t bytesSize) throw (cms::CMSEException)
Creates a BytesMessage and sets the payload to the passed value.
- virtual **cms::StreamMessage** * **createStreamMessage** () throw (cms::CMSEException)
Creates a new StreamMessage.

- virtual **cms::TextMessage** * **createTextMessage** () throw (cms::CMSEException)
Creates a new TextMessage.
- virtual **cms::TextMessage** * **createTextMessage** (const std::string &text) throw (cms::CMSEException)
Creates a new TextMessage and set the text to the value given.
- virtual **cms::MapMessage** * **createMapMessage** () throw (cms::CMSEException)
Creates a new MapMessage.
- virtual **cms::Session::AcknowledgeMode** **getAcknowledgeMode** () const throw (cms::CMSEException)
Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () const throw (cms::CMSEException)
Gets if the Sessions is a Transacted Session.
- virtual void **unsubscribe** (const std::string &name) throw (cms::CMSEException)
Unsubscribes a durable subscription that has been created by a client.

6.412.1 Detailed Description

A pooled session object that wraps around a delegate session. Calls to close this session only result in giving the session back to the pool.

6.412.2 Constructor & Destructor Documentation

6.412.2.1 **activemq::cmsutil::PooledSession::PooledSession** (SessionPool * *pool*, cms::Session * *session*)

6.412.2.2 **virtual activemq::cmsutil::PooledSession::~~PooledSession** () [virtual]

Does nothing.

6.412.3 Member Function Documentation

6.412.3.1 **virtual void activemq::cmsutil::PooledSession::close** () throw (cms::CMSEException) [virtual]

Returns this session back to the pool, but does not close or destroy the internal session object. Implements **cms::Session** (p. 2273).

6.412.3.2 **virtual void activemq::cmsutil::PooledSession::commit** () throw (cms::CMSEException) [inline, virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSEException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2274).

References cms::Session::commit().

6.412.3.3 `virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * queue, const std::string & selector) throw (cms::CMSEException)` [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSEException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2274).

6.412.3.4 `virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * queue) throw (cms::CMSEException)` [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSEException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2274).

6.412.3.5 `virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage (const unsigned char * bytes, std::size_t bytesSize) throw (cms::CMSEException) [inline, virtual]`

Creates a BytesMessage and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2275).

References cms::Session::createBytesMessage().

6.412.3.6 `virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage () throw (cms::CMSEException) [inline, virtual]`

Creates a BytesMessage.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2275).

References cms::Session::createBytesMessage().

6.412.3.7 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createCachedConsumer (const cms::Destination * destination, const std::string & selector, bool noLocal) throw (cms::CMSEException) [virtual]`

First checks the internal consumer cache and creates one if none exist for the given destination, selector, noLocal. If created, the consumer is added to the pool's lifecycle manager.

Parameters:

destination the destination to receive on

selector the selector to use

noLocal whether or not to receive messages from the same connection

Returns:

the consumer resource

Exceptions:

cms::CMSEException (p. 850) if something goes wrong.

6.412.3.8 `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createCachedProducer (const cms::Destination * destination) throw (cms::CMSEException)` [virtual]

First checks the internal producer cache and creates one if none exist for the given destination. If created, the producer is added to the pool's lifecycle manager.

Parameters:

destination the destination to send on

Returns:

the producer resource

Exceptions:

cms::CMSEException (p. 850) if something goes wrong.

6.412.3.9 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * destination, const std::string & selector, bool noLocal) throw (cms::CMSEException)` [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSEException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements `cms::Session` (p. 2275).

References `cms::Session::createConsumer()`.

6.412.3.10 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * destination, const std::string & selector) throw (cms::CMSEException)` [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSEException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2276).

References cms::Session::createConsumer().

```
6.412.3.11 virtual cms::MessageConsumer* ac-
tivemq::cmsutil::PooledSession::createConsumer (const
cms::Destination * destination) throw ( cms::CMSEException ) [inline,
virtual]
```

Creates a MessageConsumer for the specified destination.

Parameters:

destination the Destination that this consumer receiving messages for.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSEException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2276).

References cms::Session::createConsumer().

```
6.412.3.12 virtual cms::MessageConsumer* ac-
tivemq::cmsutil::PooledSession::createDurableConsumer
(const cms::Topic * destination, const std::string & name,
const std::string & selector, bool noLocal = false) throw (
cms::CMSEException ) [inline, virtual]
```

Creates a durable subscriber to the specified topic, using a Message selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSEException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2277).

References cms::Session::createDurableConsumer().

6.412.3.13 `virtual cms::MapMessage* activemq::cmsutil::PooledSession::createMapMessage ()
throw (cms::CMSEException) [inline, virtual]`

Creates a new MapMessage.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2277).

References cms::Session::createMapMessage().

6.412.3.14 `virtual cms::Message* activemq::cmsutil::PooledSession::createMessage
() throw (cms::CMSEException) [inline, virtual]`

Creates a new Message.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2278).

References cms::Session::createMessage().

6.412.3.15 `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createProducer (const
cms::Destination * destination) throw (cms::CMSEException) [inline,
virtual]`

Creates a MessageProducer to send messages to the specified destination.

Parameters:

destination the Destination to send on

Returns:

New MessageProducer that is owned by the caller.

Exceptions:

CMSEException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2278).

References cms::Session::createProducer().

6.412.3.16 `virtual cms::Queue* activemq::cmsutil::PooledSession::createQueue
(const std::string & queueName) throw (cms::CMSEException)
[inline, virtual]`

Creates a queue identity given a Queue name.

Parameters:

queueName the name of the new Queue

Returns:

new Queue pointer that is owned by the caller.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2278).

References cms::Session::createQueue().

6.412.3.17 `virtual cms::StreamMessage* ac-
tivemq::cmsutil::PooledSession::createStreamMessage ()
throw (cms::CMSEException) [inline, virtual]`

Creates a new StreamMessage.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2279).

References cms::Session::createStreamMessage().

6.412.3.18 `virtual cms::TemporaryQueue* activemq::cmsutil::PooledSession::createTemporaryQueue ()
throw (cms::CMSException) [inline, virtual]`

Creates a TemporaryQueue object.

Returns:

new TemporaryQueue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2279).

References cms::Session::createTemporaryQueue().

6.412.3.19 `virtual cms::TemporaryTopic* activemq::cmsutil::PooledSession::createTemporaryTopic ()
throw (cms::CMSException) [inline, virtual]`

Creates a TemporaryTopic object.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2279).

References cms::Session::createTemporaryTopic().

6.412.3.20 `virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage (const
std::string & text) throw (cms::CMSException) [inline, virtual]`

Creates a new TextMessage and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2279).

References cms::Session::createTextMessage().

6.412.3.21 `virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage ()
throw (cms::CMSException) [inline, virtual]`

Creates a new TextMessage.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2280).

References cms::Session::createTextMessage().

6.412.3.22 `virtual cms::Topic* activemq::cmsutil::PooledSession::createTopic (const std::string & topicName) throw (cms::CMSEException) [inline, virtual]`

Creates a topic identity given a Queue name.

Parameters:

topicName the name of the new Topic

Returns:

new Topic pointer that is owned by the caller.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2280).

References cms::Session::createTopic().

6.412.3.23 `virtual cms::Session::AcknowledgeMode activemq::cmsutil::PooledSession::getAcknowledgeMode () const throw (cms::CMSEException) [inline, virtual]`

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2280).

References cms::Session::getAcknowledgeMode().

6.412.3.24 `virtual const cms::Session* activemq::cmsutil::PooledSession::getSession () const [inline, virtual]`

Returns a constant reference to the internal session object.

Returns:

the session object.

6.412.3.25 `virtual cms::Session* activemq::cmsutil::PooledSession::getSession ()`
[inline, virtual]

Returns a non-constant reference to the internal session object.

Returns:

the session object.

6.412.3.26 `virtual bool activemq::cmsutil::PooledSession::isTransacted () const`
`throw (cms::CMSException)` [inline, virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Exceptions:

CMSException - If an internal error occurs.

Implements `cms::Session` (p. 2281).

References `cms::Session::isTransacted()`.

6.412.3.27 `virtual void activemq::cmsutil::PooledSession::recover () throw (`
`cms::CMSException)` [inline, virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements `cms::Session` (p. 2281).

References `cms::Session::recover()`.

6.412.3.28 `virtual void activemq::cmsutil::PooledSession::rollback () throw (cms::CMSException) [inline, virtual]`

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2281).

References cms::Session::rollback().

6.412.3.29 `virtual void activemq::cmsutil::PooledSession::unsubscribe (const std::string & name) throw (cms::CMSException) [inline, virtual]`

Unsubscribes a durable subscription that has been created by a client. This method deletes the **state** (p. 65) being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2282).

References cms::Session::unsubscribe().

- src/main/activemq/cmsutil/**PooledSession.h**

6.413 decaf::util::concurrent::PooledThread Class Reference

#include <src/main/decaf/util/concurrent/PooledThread.h> Inheritance diagram for decaf::util::concurrent::PooledThread:

Public Member Functions

- **PooledThread** (**ThreadPool** *pool)

Constructor.

- virtual ~**PooledThread** ()
- virtual void **run** ()

*Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 2549) and then grabs it and calls its run method.*

- virtual void **stop** () throw (lang::Exception)

Stops the Thread, thread will complete its task if currently running one, and then die.

- virtual bool **isBusy** ()

Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.

- virtual void **setPooledThreadListener** (**PooledThreadListener** *listener)

*Adds a listener to this **PooledThread** (p. 2032) to be notified when this thread starts and completes a task.*

- virtual **PooledThreadListener** * **getPooledThreadListener** ()

*Removes a listener for this **PooledThread** (p. 2032) to be notified when this thread starts and completes a task.*

6.413.1 Constructor & Destructor Documentation

6.413.1.1 decaf::util::concurrent::PooledThread::PooledThread (**ThreadPool** * pool)

Constructor.

Parameters:

pool the parent **ThreadPool** (p. 2549) object

6.413.1.2 virtual decaf::util::concurrent::PooledThread::~~PooledThread ()
[virtual]

6.413.2 Member Function Documentation

6.413.2.1 virtual PooledThreadListener* decaf::util::concurrent::PooledThread::getPooledThreadListener ()
[inline, virtual]

Removes a listener for this PooledThread (p.2032) to be notified when this thread starts and completes a task.

Returns:

a pointer to this thread's listener or NULL

6.413.2.2 virtual bool decaf::util::concurrent::PooledThread::isBusy () [inline, virtual]

Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.

Returns:

true if the Thread is busy

6.413.2.3 virtual void decaf::util::concurrent::PooledThread::run () [virtual]

Run Method for this object waits for something to be enqueued on the **ThreadPool** (p.2549) and then grabs it and calls its run method.

Reimplemented from **decaf::lang::Thread** (p.2545).

6.413.2.4 virtual void decaf::util::concurrent::PooledThread::setPooledThreadListener (PooledThreadListener * *listener*) [inline, virtual]

Adds a listener to this PooledThread (p.2032) to be notified when this thread starts and completes a task.

Parameters:

listener the listener to send notifications to.

6.413.2.5 virtual void decaf::util::concurrent::PooledThread::stop () throw (lang::Exception) [virtual]

Stops the Thread, thread will complete its task if currently running one, and then die. Does not block.

Exceptions:

Exception

[inline, virtual]

6.414.3 Member Function Documentation

- 6.414.3.1 virtual void `decaf::util::concurrent::PooledThreadListener::onTaskCompleted (PooledThread * thread)` [pure virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.

Parameters:

thread - Pointer the the Pooled Thread that is making this call.

Implemented in **decaf::util::concurrent::ThreadPool** (p. 2552).

6.414.3.2 virtual void decaf::util::concurrent::PooledThreadListener::onTaskException (PooledThread * *thread*, lang::Exception & *ex*) [pure virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2032) is now no longer running.

Parameters:

thread - Pointer to the Pooled Thread that is making this call

ex - The Exception that occurred.

Implemented in **decaf::util::concurrent::ThreadPool** (p. 2552).

6.414.3.3 virtual void decaf::util::concurrent::PooledThreadListener::onTaskStarted (PooledThread * *thread*) [pure virtual]

Called by a pooled thread when it is about to begin executing a new task.

Parameters:

thread - Pointer to the Pooled Thread that is making this call

Implemented in **decaf::util::concurrent::ThreadPool** (p. 2553).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**PooledThreadListener.h**

6.415 decaf::net::PortUnreachableException Class Reference

#include <src/main/decaf/net/PortUnreachableException.h> Inheritance diagram for decaf::net::PortUnreachableException:

Public Member Functions

- **PortUnreachableException** () throw ()
Default Constructor.
- **PortUnreachableException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **PortUnreachableException** (const **PortUnreachableException** &ex) throw ()
Copy Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **PortUnreachableException** (const std::exception *cause) throw ()
Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **PortUnreachableException** * clone () const
Clones this exception.
- virtual ~**PortUnreachableException** () throw ()

6.415.1 Constructor & Destructor Documentation

6.415.1.1 decaf::net::PortUnreachableException::PortUnreachableException () throw () [inline]

Default Constructor.

6.415.1.2 decaf::net::PortUnreachableException::PortUnreachableException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.415.1.3 decaf::net::PortUnreachableException::PortUnreachableException (const PortUnreachableException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.415.1.4 decaf::net::PortUnreachableException::PortUnreachableException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.415.1.5 decaf::net::PortUnreachableException::PortUnreachableException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.415.1.6 decaf::net::PortUnreachableException::PortUnreachableException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.415.1.7 **virtual**
decaf::net::PortUnreachableException::~~PortUnreachableException ()
throw () [inline, virtual]

6.415.2 Member Function Documentation

6.415.2.1 **virtual PortUnreachableException* de-**
caf::net::PortUnreachableException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2380).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**PortUnreachableException.h**

6.416 activemq::util::PrimitiveList Class Reference

List of primitives.

#include <src/main/activemq/util/PrimitiveList.h> Inheritance diagram for activemq::util::PrimitiveList:

Public Member Functions

- **PrimitiveList** ()
Default Constructor, creates an Empty list.
- virtual ~**PrimitiveList** ()
- **PrimitiveList** (const **decaf::util::List**< **PrimitiveValueNode** > &src)
Copy Constructor.
- **PrimitiveList** (const **PrimitiveList** &src)
Copy Constructor.
- std::string **toString** () const
Converts the contents into a formatted string that can be output in a Log File or other debugging tool.
- virtual bool **getBool** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Boolean value at the specified index.
- virtual void **setBool** (std::size_t index, bool value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual unsigned char **getByte** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Byte value at the specified index.
- virtual void **setByte** (std::size_t index, unsigned char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual char **getChar** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Character value at the specified index.

- virtual void **setChar** (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual short **getShort** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Short value at the specified index.
- virtual void **setShort** (std::size_t index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual int **getInt** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Integer value at the specified index.
- virtual void **setInt** (std::size_t index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual long long **getLong** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Long value at the specified index.
- virtual void **setLong** (std::size_t index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual float **getFloat** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Float value at the specified index.
- virtual void **setFloat** (std::size_t index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual double **getDouble** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Double value at the specified index.

- virtual void **setDouble** (std::size_t index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::string **getString** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the String value at the specified index.

- virtual void **setString** (std::size_t index, const std::string &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::vector< unsigned char > **getByteArray** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Byte Array value at the specified index.

- virtual void **setByteArray** (std::size_t index, const std::vector< unsigned char > &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

6.416.1 Detailed Description

List of primitives.

6.416.2 Constructor & Destructor Documentation

6.416.2.1 activemq::util::PrimitiveList::PrimitiveList ()

Default Constructor, creates an Empty list.

6.416.2.2 virtual activemq::util::PrimitiveList::~~PrimitiveList () [virtual]

6.416.2.3 activemq::util::PrimitiveList::PrimitiveList (const decaf::util::List< PrimitiveValueNode > & src)

Copy Constructor.

Parameters:

src - the Decaf List of PrimitiveNodeValues to copy

6.416.2.4 activemq::util::PrimitiveList::PrimitiveList (const PrimitiveList & *src*)

Copy Constructor.

Parameters:

src - the **PrimitiveList** (p. 2040) to copy

6.416.3 Member Function Documentation

6.416.3.1 virtual bool activemq::util::PrimitiveList::getBool (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Boolean value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.2 virtual unsigned char activemq::util::PrimitiveList::getBytes (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Byte value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.3 `virtual std::vector<unsigned char> activemq::util::PrimitiveList::getByteArray (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Byte Array value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > `size()` (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.4 `virtual char activemq::util::PrimitiveList::getChar (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Character value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > `size()` (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.5 `virtual double activemq::util::PrimitiveList::getDouble (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Double value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.6 virtual float activemq::util::PrimitiveList::getFloat (std::size_t *index*)
const throw (decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Float value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.7 virtual int activemq::util::PrimitiveList::getInt (std::size_t *index*)
const throw (decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Integer value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.8 virtual long long activemq::util::PrimitiveList::getLong (std::size_t *index*)
const throw (decaf::lang::exceptions::IndexOutOfBoundsException,
decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Long value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.9 `virtual short activemq::util::PrimitiveList::getShort (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Short value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.10 `virtual std::string activemq::util::PrimitiveList::getString (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the String value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is $> \text{size}()$ (p. 2428)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.416.3.11 `virtual void activemq::util::PrimitiveList::setBool (std::size_t index,
bool value) throw (decaf::lang::exceptions::IndexOutOfBoundsException
)` [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.12 `virtual void activemq::util::PrimitiveList::setByte
(std::size_t index, unsigned char value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.13 `virtual void activemq::util::PrimitiveList::setByteArray (std::size_t
index, const std::vector< unsigned char > & value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.14 `virtual void activemq::util::PrimitiveList::setChar (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.15 `virtual void activemq::util::PrimitiveList::setDouble (std::size_t index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.16 `virtual void activemq::util::PrimitiveList::setFloat (std::size_t index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.17 `virtual void activemq::util::PrimitiveList::setInt (std::size_t index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.18 `virtual void activemq::util::PrimitiveList::setLong (std::size_t index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.19 `virtual void activemq::util::PrimitiveList::setShort (std::size_t index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > size() (p. 2428).

6.416.3.20 `virtual void activemq::util::PrimitiveList::setString
(std::size_t index, const std::string & value) throw (
decaf::lang::exceptions::IndexOutOfBoundsException)` [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if `index > size()` (p. 2428).

6.416.3.21 `std::string activemq::util::PrimitiveList::toString () const`

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns:

formatted String of all elements in the list.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveList.h`

6.417 activemq::util::PrimitiveMap Class Reference

Map of named primitives.

#include <src/main/activemq/util/PrimitiveMap.h> Inheritance diagram for activemq::util::PrimitiveMap:

Public Member Functions

- **PrimitiveMap** ()
Default Constructor, creates an empty map.
- virtual ~**PrimitiveMap** ()
- **PrimitiveMap** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &source)
Copy Constructor.
- **PrimitiveMap** (const **PrimitiveMap** &source)
Copy Constructor.
- std::string **toString** () const
Converts the contents into a formatted string that can be output in a Log File or other debugging tool.
- virtual bool **getBool** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setBool** (const std::string &key, bool value)
Sets the value at key to the specified type.
- virtual unsigned char **getByte** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setByte** (const std::string &key, unsigned char value)
Sets the value at key to the specified type.
- virtual char **getChar** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)
Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setChar** (const std::string &key, char value)

Sets the value at key to the specified type.

- virtual short **getShort** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setShort** (const std::string &key, short value)

Sets the value at key to the specified type.

- virtual int **getInt** (const std::string &key) const throw (de-
cafe::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setInt** (const std::string &key, int value)

Sets the value at key to the specified type.

- virtual long long **getLong** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setLong** (const std::string &key, long long value)

Sets the value at key to the specified type.

- virtual float **getFloat** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setFloat** (const std::string &key, float value)

Sets the value at key to the specified type.

- virtual double **getDouble** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setDouble** (const std::string &key, double value)

Sets the value at key to the specified type.

- virtual std::string **getString** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
cafe::lang::exceptions::UnsupportedOperationException)

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setString** (const std::string &key, const std::string &value)

Sets the value at key to the specified type.

- virtual std::vector< unsigned char > **getByteArray** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setByteArray** (const std::string &key, const std::vector< unsigned char > &value)

Sets the value at key to the specified type.

6.417.1 Detailed Description

Map of named primitives.

6.417.2 Constructor & Destructor Documentation

6.417.2.1 activemq::util::PrimitiveMap::PrimitiveMap ()

Default Constructor, creates an empty map.

6.417.2.2 virtual activemq::util::PrimitiveMap::~~PrimitiveMap () [virtual]

6.417.2.3 activemq::util::PrimitiveMap::PrimitiveMap (const decaf::util::Map< std::string, PrimitiveValueNode > & source)

Copy Constructor.

Parameters:

source The Decaf Library Map instance whose elements will be copied into this Map.

6.417.2.4 activemq::util::PrimitiveMap::PrimitiveMap (const PrimitiveMap & source)

Copy Constructor.

Parameters:

source The **PrimitiveMap** (p. 2051) whose elements will be copied into this Map.

6.417.3 Member Function Documentation

6.417.3.1 `virtual bool activemq::util::PrimitiveMap::getBool (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.2 `virtual unsigned char activemq::util::PrimitiveMap::getBytes (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.3 `virtual std::vector<unsigned char> activemq::util::PrimitiveMap::getBytesArray (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at *key* in the type requested.

Exceptions:

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.4 `virtual char activemq::util::PrimitiveMap::getChar (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Character value at the given *key*, if the *key* is not in the map or cannot be returned as the requested value then an exception of type *NoSuchElementException* is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at *key* in the type requested.

Exceptions:

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.5 `virtual double activemq::util::PrimitiveMap::getDouble (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Double value at the given *key*, if the *key* is not in the map or cannot be returned as the requested value then an exception of type *NoSuchElementException* is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at *key* in the type requested.

Exceptions:

NoSuchElementException if *key* is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.6 `virtual float activemq::util::PrimitiveMap::getFloat (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.7 `virtual int activemq::util::PrimitiveMap::getInt (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.8 `virtual long long activemq::util::PrimitiveMap::getLong (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.9 virtual short activemq::util::PrimitiveMap::getShort (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.10 virtual std::string activemq::util::PrimitiveMap::getString (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.417.3.11 virtual void activemq::util::PrimitiveMap::setBool (const std::string & *key*, bool *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.12 virtual void activemq::util::PrimitiveMap::setByte (const std::string & *key*, unsigned char *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.13 virtual void activemq::util::PrimitiveMap::setByteArray (const std::string & *key*, const std::vector< unsigned char > & *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.14 virtual void activemq::util::PrimitiveMap::setChar (const std::string & *key*, char *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.15 virtual void activemq::util::PrimitiveMap::setDouble (const std::string & *key*, double *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.16 virtual void activemq::util::PrimitiveMap::setFloat (const std::string & *key*, float *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.17 virtual void activemq::util::PrimitiveMap::setInt (const std::string & *key*, int *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.18 virtual void activemq::util::PrimitiveMap::setLong (const std::string & *key*, long long *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.19 virtual void activemq::util::PrimitiveMap::setShort (const std::string & *key*, short *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.20 `virtual void activemq::util::PrimitiveMap::setString (const std::string & key, const std::string & value) [virtual]`

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.417.3.21 `std::string activemq::util::PrimitiveMap::toString () const`

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns:

formatted String of all elements in the map.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveMap.h`

6.418 activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller Class Reference

This class wraps the functionality needed to **marshal** (p. 76) a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

```
#include <src/main/activemq/wireformat/openwire/marshal/PrimitiveTypesMarshaller.h>
```

Public Member Functions

- **PrimitiveTypesMarshaller** ()
- virtual **~PrimitiveTypesMarshaller** ()

Static Public Member Functions

- static void **marshal** (const **util::PrimitiveMap** *map, std::vector< unsigned char > &dest) throw (decaf::lang::Exception)
Static Marshal of a primitive map object.
- static void **unmarshal** (**util::PrimitiveMap** *map, const std::vector< unsigned char > &src) throw (decaf::lang::Exception)
Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.
- static void **marshal** (const **util::PrimitiveList** *list, std::vector< unsigned char > &dest) throw (decaf::lang::Exception)
Static Marshal of a primitive map object.
- static void **unmarshal** (**util::PrimitiveList** *list, const std::vector< unsigned char > &src) throw (decaf::lang::Exception)
Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.

Static Protected Member Functions

- static void **marshalPrimitiveMap** (decaf::io::DataOutputStream &dataOut, const decaf::util::Map< std::string, util::PrimitiveValueNode > &map) throw (decaf::io::IOException)
Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.
- static void **marshalPrimitiveList** (decaf::io::DataOutputStream &dataOut, const decaf::util::List< util::PrimitiveValueNode > &list) throw (decaf::io::IOException)
Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.
- static void **marshalPrimitive** (decaf::io::DataOutputStream &dataOut, const util::PrimitiveValueNode &value) throw (decaf::io::IOException)
Used to Marshal the Primitive types out on the Wire.

- static void **unmarshalPrimitiveMap** (decaf::io::DataInputStream &dataIn, util::PrimitiveMap &map) throw (decaf::io::IOException)

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

- static void **unmarshalPrimitiveList** (decaf::io::DataInputStream &dataIn, decaf::util::StIList< util::PrimitiveValueNode > &list) throw (decaf::io::IOException)

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

- static util::PrimitiveValueNode **unmarshalPrimitive** (decaf::io::DataInputStream &dataIn) throw (decaf::io::IOException)

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

6.418.1 Detailed Description

This class wraps the functionality needed to **marshal** (p. 76) a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

6.418.2 Constructor & Destructor Documentation

- 6.418.2.1 **activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::PrimitiveTypesMarshaller** () [inline]

- 6.418.2.2 **virtual**
activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::~~PrimitiveTypesMarshaller () [inline, virtual]

6.418.3 Member Function Documentation

- 6.418.3.1 **static void** **activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal** (const util::PrimitiveList * *list*, std::vector< unsigned char > & *dest*) throw (decaf::lang::Exception) [static]

Static Marshal of a primitive map object.

Parameters:

list The list object to Marshal

dest Reference to a byte array to house the data

Exceptions:

Exception

6.418.3.2 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveMap * *map*, std::vector< unsigned char > & *dest*) throw (decaf::lang::Exception) [static]

Static Marshal of a primitive map object.

Parameters:

map Map to Marshal.

dest Reference to a byte array to house the data.

Exceptions:

Exception

6.418.3.3 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive (decaf::io::DataOutputStream & *dataOut*, const util::PrimitiveValueNode & *value*) throw (decaf::io::IOException) [static, protected]

Used to Marshal the Primitive types out on the Wire.

Parameters:

dataOut - the DataOutputStream to write to

value - the ValueNode to write.

Exceptions:

IOException

6.418.3.4 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveList (decaf::io::DataOutputStream & *dataOut*, const decaf::util::List< util::PrimitiveValueNode > & *list*) throw (decaf::io::IOException) [static, protected]

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters:

dataOut - the DataOutputStream to write to

list - the ValueNode to write.

Exceptions:

IOException

6.418.3.5 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveMap (decaf::io::DataOutputStream & *dataOut*, const decaf::util::Map< std::string, util::PrimitiveValueNode > & *map*) throw (decaf::io::IOException) [static, protected]

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters:

dataOut - the DataOutputStream to write to

map - the ValueNode to write.

Exceptions:

IOException

6.418.3.6 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveList * *list*, const std::vector< unsigned char > & *src*) throw (decaf::lang::Exception) [static]

Static Map Unmarshaller, takes an array of bytes and returns a new instance of a PrimitiveMap object. Caller owns the pointer.

Parameters:

list The list object to Un-marshal

src Reference to a byte array to read data from.

Exceptions:

Exception

6.418.3.7 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveMap * *map*, const std::vector< unsigned char > & *src*) throw (decaf::lang::Exception) [static]

Static Map Unmarshaller, takes an array of bytes and returns a new instance of a PrimitiveMap object. Caller owns the pointer.

Parameters:

map Map to Unmarshal into

src Reference to a byte array to read data from.

Exceptions:

Exception

6.418.3.8 static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive (decaf::io::DataInputStream & *dataIn*) throw (decaf::io::IOException)
[static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

Parameters:

dataIn - DataInputStream to read from.

Returns:

a PrimitiveValueNode containing the data.

Exceptions:

IOException

6.418.3.9 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveList (decaf::io::DataInputStream & *dataIn*, decaf::util::StlList< util::PrimitiveValueNode > & *list*) throw (decaf::io::IOException)
[static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters:

dataIn - DataInputStream to read from.

list - the ValueNode to write.

Exceptions:

IOException

6.418.3.10 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveMap (decaf::io::DataInputStream & *dataIn*, util::PrimitiveMap & *map*)
throw (decaf::io::IOException) [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters:

dataIn - DataInputStream to read from.

map - the map to fill with data.

Exceptions:

IOException

6.420 activemq::util::PrimitiveValueConverter Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p.2070) from one type to another.

```
#include <src/main/activemq/util/PrimitiveValueConverter.h>
```

Public Member Functions

- **PrimitiveValueConverter** ()
- virtual **~PrimitiveValueConverter** ()
- template<typename TO >
TO **convert** (const **PrimitiveValueNode** &value) const throw (decaf::lang::exceptions::UnsupportedOperationException)

6.420.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p.2070) from one type to another. If the conversion is supported then calling the convert method will throw an UnsupportedOperationException to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

	boolean	byte	short	int	long	float	double	String
boolean	X X							
byte		X X X X X						
short			X X X X					
int				X X X				
long					X X			
float						X X X		
double							X X X	
String								X X X X X X X

6.420.3.1 **std::vector< unsigned char > activemq::util::PrimitiveValueConverter::convert** (const **PrimitiveValueNode** & *value*) const throw (decaf::lang::exceptions::UnsupportedOperationException)
[inline]

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveValueConverter.h`

6.421 activemq::util::PrimitiveValueNode Class Reference

Class that wraps around a single value of one of the many types.

```
#include <src/main/activemq/util/PrimitiveValueNode.h>
```

Data Structures

- union **PrimitiveValue**

Define a union type comprised of the various types.

Public Types

- enum **PrimitiveType** {
 NULL_TYPE = 0, **BOOLEAN_TYPE** = 1, **BYTE_TYPE** = 2, **CHAR_TYPE** = 3,
 SHORT_TYPE = 4, **INTEGER_TYPE** = 5, **LONG_TYPE** = 6, **DOUBLE_TYPE** = 7,
 FLOAT_TYPE = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10, **MAP_TYPE** = 11,
 LIST_TYPE = 12, **BIG_STRING_TYPE** = 13 }

Enumeration for the various primitive types.

Public Member Functions

- **PrimitiveValueNode** ()
Default Constructor, creates a value of the NULL_TYPE.
- **PrimitiveValueNode** (bool value)
Boolean Value Constructor.
- **PrimitiveValueNode** (unsigned char value)
Byte Value Constructor.
- **PrimitiveValueNode** (char value)
Char Value Constructor.
- **PrimitiveValueNode** (short value)
Short Value Constructor.
- **PrimitiveValueNode** (int value)
Int Value Constructor.
- **PrimitiveValueNode** (long long value)
Long Value Constructor.
- **PrimitiveValueNode** (float value)

Float Value Constructor.

- **PrimitiveValueNode** (double value)
Double Value Constructor.
- **PrimitiveValueNode** (const char *value)
String Value Constructor.
- **PrimitiveValueNode** (const std::string &value)
String Value Constructor.
- **PrimitiveValueNode** (const std::vector< unsigned char > &value)
Byte Array Value Constructor.
- **PrimitiveValueNode** (const decaf::util::List< PrimitiveValueNode > &value)
Primitive List Constructor.
- **PrimitiveValueNode** (const decaf::util::Map< std::string, PrimitiveValueNode > &value)
Primitive Map Value Constructor.
- **PrimitiveValueNode** (const PrimitiveValueNode &node)
Copy constructor.
- **~PrimitiveValueNode** ()
- **PrimitiveValueNode & operator=** (const PrimitiveValueNode &node)
Assignment operator, copies the data from the other node.
- **bool operator==** (const PrimitiveValueNode &node) const
Comparison Operator, compares this node to the other node.
- **PrimitiveType getType** () const
Gets the Value Type of this type wrapper.
- **PrimitiveValue getValue** () const
Gets the internal Primitive Value object from this wrapper.
- **void setValue** (const PrimitiveValue &value, PrimitiveType valueType)
Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.
- **void clear** ()
Clears the value from this wrapper converting it back to a blank NULL_ TYPE value.
- **void setBool** (bool value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- **bool getBool** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Boolean value of this Node.

- void **setByte** (unsigned char value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- unsigned char **getByte** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Byte value of this Node.
- void **setChar** (char value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- char **getChar** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Character value of this Node.
- void **setShort** (short value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- short **getShort** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Short value of this Node.
- void **setInt** (int value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- int **getInt** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Integer value of this Node.
- void **setLong** (long long value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- long long **getLong** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Long value of this Node.
- void **setFloat** (float value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- float **getFloat** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Float value of this Node.
- void **setDouble** (double value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- double **getDouble** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Double value of this Node.

- void **setString** (const std::string &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::string **getString** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the String value of this Node.
- void **setByteArray** (const std::vector< unsigned char > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::vector< unsigned char > **getByteArray** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Byte Array value of this Node.
- void **setList** (const decaf::util::List< PrimitiveValueNode > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- const decaf::util::List< PrimitiveValueNode > & **getList** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Primitive List value of this Node.
- void **setMap** (const decaf::util::Map< std::string, PrimitiveValueNode > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- const decaf::util::Map< std::string, PrimitiveValueNode > & **getMap** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Primitive Map value of this Node.
- std::string **toString** () const
Creates a string representation of this value.

6.421.1 Detailed Description

Class that wraps around a single value of one of the many types. Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

6.421.2 Member Enumeration Documentation

6.421.2.1 enum activemq::util::PrimitiveValueNode::PrimitiveType

Enumeration for the various primitive types.

Enumerator:

NULL_ **TYPE**

BOOLEAN_TYPE
BYTE_TYPE
CHAR_TYPE
SHORT_TYPE
INTEGER_TYPE
LONG_TYPE
DOUBLE_TYPE
FLOAT_TYPE
STRING_TYPE
BYTE_ARRAY_TYPE
MAP_TYPE
LIST_TYPE
BIG_STRING_TYPE

6.421.3 Constructor & Destructor Documentation

6.421.3.1 `activemq::util::PrimitiveValueNode::PrimitiveValueNode ()`

Default Constructor, creates a value of the `NULL_TYPE`.

6.421.3.2 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (bool value)`

Boolean Value Constructor.

Parameters:

value - the new value to store.

6.421.3.3 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (unsigned char value)`

Byte Value Constructor.

Parameters:

value - the new value to store.

6.421.3.4 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (char value)`

Char Value Constructor.

Parameters:

value - the new value to store.

6.421.3.5 activemq::util::PrimitiveValueNode::PrimitiveValueNode (short *value*)

Short Value Constructor.

Parameters:

value - the new value to store.

6.421.3.6 activemq::util::PrimitiveValueNode::PrimitiveValueNode (int *value*)

Int Value Constructor.

Parameters:

value - the new value to store.

6.421.3.7 activemq::util::PrimitiveValueNode::PrimitiveValueNode (long long *value*)

Long Value Constructor.

Parameters:

value - the new value to store.

6.421.3.8 activemq::util::PrimitiveValueNode::PrimitiveValueNode (float *value*)

Float Value Constructor.

Parameters:

value - the new value to store.

6.421.3.9 activemq::util::PrimitiveValueNode::PrimitiveValueNode (double *value*)

Double Value Constructor.

Parameters:

value - the new value to store.

6.421.3.10 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const char * *value*)

String Value Constructor.

Parameters:

value - the new value to store.

6.421.3.11 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::string & value)`

String Value Constructor.

Parameters:

value - the new value to store.

6.421.3.12 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::vector< unsigned char > & value)`

Byte Array Value Constructor.

Parameters:

value - the new value to store.

6.421.3.13 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::List< PrimitiveValueNode > & value)`

Primitive List Constructor.

Parameters:

value - the new value to store.

6.421.3.14 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::Map< std::string, PrimitiveValueNode > & value)`

Primitive Map Value Constructor.

Parameters:

value - the new value to store.

6.421.3.15 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const PrimitiveValueNode & node)`

Copy constructor.

Parameters:

node The instance of another node to copy to this one.

6.421.3.16 `activemq::util::PrimitiveValueNode::~~PrimitiveValueNode () [inline]`

6.421.4 Member Function Documentation

6.421.4.1 `void activemq::util::PrimitiveValueNode::clear ()`

Clears the value from this wrapper converting it back to a blank NULL_TYPE value.

6.421.4.2 `bool activemq::util::PrimitiveValueNode::getBool () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Boolean value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.3 `unsigned char activemq::util::PrimitiveValueNode::getBytes () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Byte value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.4 `std::vector<unsigned char> activemq::util::PrimitiveValueNode::getBytesArray () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Byte Array value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.5 `char activemq::util::PrimitiveValueNode::getChar () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Character value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.6 double activemq::util::PrimitiveValueNode::getDouble () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Double value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.7 float activemq::util::PrimitiveValueNode::getFloat () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Float value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.8 int activemq::util::PrimitiveValueNode::getInt () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Integer value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.9 const decaf::util::List<PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getList () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Primitive List value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.10 `long long activemq::util::PrimitiveValueNode::getLong () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Long value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.11 `const decaf::util::Map<std::string, PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getMap () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Primitive Map value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.12 `short activemq::util::PrimitiveValueNode::getShort () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Short value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.13 `std::string activemq::util::PrimitiveValueNode::getString () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the String value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.421.4.14 PrimitiveType activemq::util::PrimitiveValueNode::getType () const
[inline]

Gets the Value Type of this type wrapper.

Returns:

the PrimitiveType value for this wrapper.

6.421.4.15 PrimitiveValue activemq::util::PrimitiveValueNode::getValue () const
[inline]

Gets the internal Primitive Value object from this wrapper.

Returns:

a copy of the contained **PrimitiveValue** (p. 2066)

6.421.4.16 PrimitiveValueNode& activemq::util::PrimitiveValueNode::operator=
(const PrimitiveValueNode & node)

Assignment operator, copies the data from the other node.

Parameters:

node The instance of another node to copy to this one.

6.421.4.17 bool activemq::util::PrimitiveValueNode::operator== (const
PrimitiveValueNode & node) const

Comparison Operator, compares this node to the other node.

Returns:

true if the values are the same false otherwise.

6.421.4.18 void activemq::util::PrimitiveValueNode::setBool (bool value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.19 void activemq::util::PrimitiveValueNode::setByte (unsigned char value)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.20 void activemq::util::PrimitiveValueNode::setByteArray (const std::vector< unsigned char > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.21 void activemq::util::PrimitiveValueNode::setChar (char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.22 void activemq::util::PrimitiveValueNode::setDouble (double *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.23 void activemq::util::PrimitiveValueNode::setFloat (float *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.24 void activemq::util::PrimitiveValueNode::setInt (int *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.25 void activemq::util::PrimitiveValueNode::setList (const decaf::util::List< PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.26 void activemq::util::PrimitiveValueNode::setLong (long long *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.27 void activemq::util::PrimitiveValueNode::setMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.28 void activemq::util::PrimitiveValueNode::setShort (short *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.29 void activemq::util::PrimitiveValueNode::setString (const std::string & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.421.4.30 void activemq::util::PrimitiveValueNode::setValue (const PrimitiveValue & *value*, PrimitiveType *valueType*)

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

Parameters:

value The value to set as the value contained in this Node.

valueType The type of the value being set into this one.

6.421.4.31 `std::string activemq::util::PrimitiveValueNode::toString () const`

Creates a string representation of this value.

Returns:

string value of this type wrapper.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveValueNode.h`

6.422 decaf::security::Principal Class Reference

Base interface for a principal, which can represent an individual or organization.

#include <src/main/decaf/security/Principal.h> Inheritance diagram for decaf::security::Principal:

Public Member Functions

- virtual **~Principal** ()
- virtual bool **equals** (const **Principal** &another) const =0
Compares two principals to see if they are the same.
- virtual std::string **getName** () const =0
Provides the name of this principal.

6.422.1 Detailed Description

Base interface for a principal, which can represent an individual or organization.

6.422.2 Constructor & Destructor Documentation

6.422.2.1 virtual decaf::security::Principal::~~Principal () [inline, virtual]

6.422.3 Member Function Documentation

6.422.3.1 virtual bool decaf::security::Principal::equals (const **Principal** & *another*) const [pure virtual]

Compares two principals to see if they are the same.

Parameters:

another A principal to be tested for equality to this one.

Returns:

true if the given principal is equivalent to this one.

6.422.3.2 virtual std::string decaf::security::Principal::getName () const [pure virtual]

Provides the name of this principal.

Returns:

the name of this principal.

Implemented in **decaf::security::auth::x500::X500Principal** (p. 2727).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**Principal.h**

6.423 activemq::commands::ProducerAck Class Reference

#include <src/main/activemq/commands/ProducerAck.h> Inheritance diagram for activemq::commands::ProducerAck:

Public Member Functions

- **ProducerAck** ()
- virtual **~ProducerAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ProducerAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &producerId)
- virtual int **getSize** () const
- virtual void **setSize** (int size)
- virtual bool **isProducerAck** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_PRODUCERACK** = 19

Protected Member Functions

- **ProducerAck** (const **ProducerAck** &)
- **ProducerAck** & **operator=** (const **ProducerAck** &)

Protected Attributes

- `Pointer< ProducerId > producerId`
- `int size`

6.423.1 Constructor & Destructor Documentation

6.423.1.1 `activemq::commands::ProducerAck::ProducerAck (const ProducerAck &) [inline, protected]`

6.423.1.2 `activemq::commands::ProducerAck::ProducerAck ()`

6.423.1.3 `virtual activemq::commands::ProducerAck::~~ProducerAck () [virtual]`

6.423.2 Member Function Documentation

6.423.2.1 `virtual ProducerAck* activemq::commands::ProducerAck::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.423.2.2 `virtual void activemq::commands::ProducerAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.423.2.3 `virtual bool activemq::commands::ProducerAck::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.423.2.4 `virtual unsigned char activemq::commands::ProducerAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

6.423.2.5 `virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () [virtual]`

6.423.2.6 `virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () const [virtual]`

6.423.2.7 `virtual int activemq::commands::ProducerAck::getSize () const [virtual]`

6.423.2.8 `virtual bool activemq::commands::ProducerAck::isProducerAck () const [inline, virtual]`

Returns:

an answer of true to the **isProducerAck()** (p. 2088) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 511).

6.423.2.9 `ProducerAck& activemq::commands::ProducerAck::operator= (const ProducerAck &) [inline, protected]`

6.423.2.10 `virtual void activemq::commands::ProducerAck::setProducerId (const Pointer< ProducerId > & producerId) [virtual]`

6.423.2.11 `virtual void activemq::commands::ProducerAck::setSize (int size) [virtual]`

6.423.2.12 `virtual std::string activemq::commands::ProducerAck::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.423.2.13 `virtual Pointer<Command> activemq::commands::ProducerAck::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.423.3 Field Documentation

6.423.3.1 `const unsigned char activemq::commands::ProducerAck::ID_-
PRODUCERACK = 19` [static]

6.423.3.2 `Pointer<ProducerId> activemq::commands::ProducerAck::producerId`
[protected]

6.423.3.3 `int activemq::commands::ProducerAck::size` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ProducerAck.h`

6.424 activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller Class Reference

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2090).

#include <src/main/activemq/wireformat/openwire/marshal/v3/ProducerAckMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller:

Public Member Functions

- **ProducerAckMarshaller** ()
- virtual **~ProducerAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.424.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2090). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.424.2 Constructor & Destructor Documentation

6.424.2.1 `activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::ProducerAckMarshaller()` `[inline]`

6.424.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::~~ProducerAckMarshaller()` `[inline, virtual]`

6.424.3 Member Function Documentation

6.424.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.424.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.424.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.424.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.424.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.424.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.424.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.425.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2094). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.425.2 Constructor & Destructor Documentation

6.425.2.1 `activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::ProducerAckMarshaller()` [inline]

6.425.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::~~ProducerAckMarshaller()` [inline, virtual]

6.425.3 Member Function Documentation

6.425.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.425.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.425.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.425.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.425.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.425.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.425.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ProducerAckMarshaller.h**

6.426 activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller Class Reference

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2098).

#include <src/main/activemq/wireformat/openwire/marshal/v2/ProducerAckMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller:

Public Member Functions

- **ProducerAckMarshaller** ()

Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.426.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2098). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.426.2 Constructor & Destructor Documentation

6.426.2.1 `activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::ProducerAckMarshaller()` [inline]

6.426.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::~~ProducerAckMarshaller()` [inline, virtual]

6.426.3 Member Function Documentation

6.426.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.426.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.426.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.426.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.426.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.426.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.426.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**ProducerAckMarshaller.h**

6.427 activemq::cmsutil::ProducerCallback Class Reference

Callback for sending a message to a CMS destination.

#include <src/main/activemq/cmsutil/ProducerCallback.h> Inheritance diagram for activemq::cmsutil::ProducerCallback:

Public Member Functions

- virtual `~ProducerCallback()`
- virtual void `doInCms(cms::Session *session, cms::MessageProducer *producer)=0`
throw (cms::CMSException)

Execute an action given a session and producer.

6.427.1 Detailed Description

Callback for sending a message to a CMS destination.

6.427.2 Constructor & Destructor Documentation

- 6.427.2.1 virtual `activemq::cmsutil::ProducerCallback::~~ProducerCallback()`
[inline, virtual]

6.427.3 Member Function Documentation

- 6.427.3.1 virtual void `activemq::cmsutil::ProducerCallback::doInCms(cms::Session * session, cms::MessageProducer * producer) throw (cms::CMSException)` [pure virtual]

Execute an action given a session and producer.

Parameters:

session the CMS Session

producer the CMS Producer

Exceptions:

cms::CMSException (p. 850) if thrown by CMS API methods

Implemented in `activemq::cmsutil::CmsTemplate::SendExecutor` (p. 2267).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/ProducerCallback.h

6.428 activemq::cmsutil::CmsTemplate::ProducerExecutor Class Reference

#include <src/main/activemq/cmsutil/CmsTemplate.h> Inheritance diagram for activemq::cmsutil::CmsTemplate::ProducerExecutor:

6.429.1 Member Typedef Documentation

6.429.1.1 `typedef decaf::lang::PointerComparator<ProducerId>
activemq::commands::ProducerId::COMPARATOR`

6.429.2 Constructor & Destructor Documentation

6.429.2.1 `activemq::commands::ProducerId::ProducerId ()`

6.429.2.2 `activemq::commands::ProducerId::ProducerId (const ProducerId &
other)`

6.429.2.3 `activemq::commands::ProducerId::ProducerId (const SessionId &
sessionId, long long consumerId) [inline]`

References `activemq::commands::SessionId::getConnectionId()`, and `activemq::commands::SessionId::getValue()`.

6.429.2.4 `virtual activemq::commands::ProducerId::~~ProducerId () [virtual]`

6.429.3 Member Function Documentation

6.429.3.1 `virtual ProducerId* ac-
tivemq::commands::ProducerId::cloneDataStructure ()
const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.429.3.2 `virtual int activemq::commands::ProducerId::compareTo (const
ProducerId & value) const [virtual]`

6.429.3.3 `virtual void activemq::commands::ProducerId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.429.3.4 virtual bool activemq::commands::ProducerId::equals (const ProducerId & *value*) const [virtual]

6.429.3.5 virtual bool activemq::commands::ProducerId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.429.3.6 virtual std::string& activemq::commands::ProducerId::getConnectionId () [virtual]

6.429.3.7 virtual const std::string& activemq::commands::ProducerId::getConnectionId () const [virtual]

6.429.3.8 virtual unsigned char activemq::commands::ProducerId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.429.3.9 `const Pointer<SessionId>& activemq::commands::ProducerId::getParentId () const`
- 6.429.3.10 `virtual long long activemq::commands::ProducerId::getSessionId () const [virtual]`
- 6.429.3.11 `virtual long long activemq::commands::ProducerId::getValue () const [virtual]`
- 6.429.3.12 `virtual bool activemq::commands::ProducerId::operator< (const ProducerId & value) const [virtual]`
- 6.429.3.13 `ProducerId& activemq::commands::ProducerId::operator= (const ProducerId & other)`
- 6.429.3.14 `virtual bool activemq::commands::ProducerId::operator== (const ProducerId & value) const [virtual]`
- 6.429.3.15 `virtual void activemq::commands::ProducerId::setConnectionId (const std::string & connectionId) [virtual]`
- 6.429.3.16 `virtual void activemq::commands::ProducerId::setSessionId (long long sessionId) [virtual]`
- 6.429.3.17 `virtual void activemq::commands::ProducerId::setValue (long long value) [virtual]`
- 6.429.3.18 `virtual std::string activemq::commands::ProducerId::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.560).

6.429.4 Field Documentation

- 6.429.4.1 `std::string activemq::commands::ProducerId::connectionId [protected]`
- 6.429.4.2 `const unsigned char activemq::commands::ProducerId::ID_ - PRODUCERID = 123 [static]`

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.429.4.3 `long long activemq::commands::ProducerId::sessionId` [protected]

6.429.4.4 `long long activemq::commands::ProducerId::value` [protected]

The documentation for this class was generated from the following file:

Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.430.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2110). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.430.2 Constructor & Destructor Documentation

6.430.2.1 `activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::ProducerIdMarshaller()` [inline]

6.430.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::~~ProducerIdMarshaller()` [inline, virtual]

6.430.3 Member Function Documentation

6.430.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.430.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.430.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.430.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.430.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.430.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.430.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.431.3 Member Function Documentation

6.431.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.431.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.431.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.431.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.431.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.431.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.431.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**ProducerIdMarshaller.h**

6.432 activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller Class Reference

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2118).

Write a object instance to data output stream.

6.432.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2118). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.432.2 Constructor & Destructor Documentation

6.432.2.1 `activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::ProducerIdMarshaller()` `[inline]`

6.432.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::~~ProducerIdMarshaller()` `[inline, virtual]`

6.432.3 Member Function Documentation

6.432.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::createObject() const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.432.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::getDataStructureType() const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.432.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.432.3.4 virtual void **activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.432.3.5 virtual int **activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - **BooleanStream** stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.432.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.432.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

- int **windowSize**

6.433.1 Constructor & Destructor Documentation

6.433.1.1 **activemq::commands::ProducerInfo::ProducerInfo** (const **ProducerInfo** &) [inline, protected]

6.433.1.2 **activemq::commands::ProducerInfo::ProducerInfo** ()

6.433.1.3 **virtual** **activemq::commands::ProducerInfo::~~ProducerInfo** () [virtual]

6.433.2 Member Function Documentation

6.433.2.1 **virtual** **ProducerInfo*** **activemq::commands::ProducerInfo::cloneDataStructure** ()
const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p.1174).

6.433.2.2 **virtual** void **activemq::commands::ProducerInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p.508).

6.433.2.3 `virtual bool activemq::commands::ProducerInfo::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.433.2.4 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath ()` [virtual]

6.433.2.5 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () const` [virtual]

6.433.2.6 `virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.433.2.7 `virtual Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination ()` [virtual]
- 6.433.2.8 `virtual const Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () const` [virtual]
- 6.433.2.9 `virtual Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId ()` [virtual]
- 6.433.2.10 `virtual const Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () const` [virtual]
- 6.433.2.11 `virtual int activemq::commands::ProducerInfo::getWindowSize () const` [virtual]
- 6.433.2.12 `virtual bool activemq::commands::ProducerInfo::isDispatchAsync () const` [virtual]
- 6.433.2.13 `virtual bool activemq::commands::ProducerInfo::isProducerInfo () const` [inline, virtual]

Returns:

an answer of true to the `isProducerInfo()` (p. 2125) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 511).

- 6.433.2.14 `ProducerInfo& activemq::commands::ProducerInfo::operator= (const ProducerInfo &)` [inline, protected]
- 6.433.2.15 `virtual void activemq::commands::ProducerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath)` [virtual]
- 6.433.2.16 `virtual void activemq::commands::ProducerInfo::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.433.2.17 `virtual void activemq::commands::ProducerInfo::setDispatchAsync (bool dispatchAsync)` [virtual]
- 6.433.2.18 `virtual void activemq::commands::ProducerInfo::setProducerId (const Pointer< ProducerId > & producerId)` [virtual]
- 6.433.2.19 `virtual void activemq::commands::ProducerInfo::setWindowSize (int windowSize)` [virtual]
- 6.433.2.20 `virtual std::string activemq::commands::ProducerInfo::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 512).

6.433.2.21 `virtual Pointer<Command> activemq::commands::ProducerInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.433.3 Field Documentation

6.433.3.1 `std::vector< decaf::lang::Pointer<BrokerId> > activemq::commands::ProducerInfo::brokerPath` [protected]

Write a object instance to data output stream.

6.434.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2127). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.434.2 Constructor & Destructor Documentation

6.434.2.1 `activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::ProducerInfoMarshaller()` [inline]

6.434.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::~~ProducerInfoMarshaller()` [inline, virtual]

6.434.3 Member Function Documentation

6.434.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.434.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.434.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.434.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.434.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.434.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.434.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

6.435.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2131). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.435.2 Constructor & Destructor Documentation

6.435.2.1 `activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::ProducerInfoMarshaller()` [inline]

6.435.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::~~ProducerInfoMarshaller()` [inline, virtual]

6.435.3 Member Function Documentation

6.435.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.435.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.435.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.435.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.435.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.435.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.435.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

6.436.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2135). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.436.2 Constructor & Destructor Documentation

6.436.2.1 `activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::ProducerInfoMarshaller()` [inline]

6.436.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::~~ProducerInfoMarshaller()` [inline, virtual]

6.436.3 Member Function Documentation

6.436.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.436.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.436.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.436.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.436.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.436.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.436.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

6.438 decaf::util::Properties Class Reference

Java-like properties class for mapping string names to string values.

```
#include <src/main/decaf/util/Properties.h>
```

Public Member Functions

- **Properties** ()
- **Properties** (const **Properties** &src)
- virtual ~**Properties** ()
- **Properties** & **operator=** (const **Properties** &src)
Assignment Operator.
- bool **isEmpty** () const
Returns true if the properties object is empty.
- std::size_t **size** () const
- const char * **getProperty** (const std::string &name) const
Looks up the value for the given property.
- std::string **getProperty** (const std::string &name, const std::string &defaultValue) const
Looks up the value for the given property.
- void **setProperty** (const std::string &name, const std::string &value)
Sets the value for a given property.
- bool **hasProperty** (const std::string &name) const
Check to see if the Property exists in the set.
- void **remove** (const std::string &name)
Removes the property with the given name.
- std::vector< std::pair< std::string, std::string > > **toArray** () const
Method that serializes the contents of the property map to an array.
- void **copy** (const **Properties** &source)
*Copies the contents of the given properties object to this one, if the given **Properties** (p. 2140) instance in NULL then this **List** (p. 1591) is not modified.*
- **Properties** * **clone** () const
Clones this object.
- void **clear** ()
Clears all properties from the map.
- bool **equals** (const **Properties** &source) const
*Test whether two **Properties** (p. 2140) objects are equivalent.*
- std::string **toString** () const

*Formats the contents of the **Properties** (p. 2140) Object into a string that can be logged, etc.*

- void **load** (decaf::io::InputStream *stream) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input byte stream.

- void **load** (decaf::io::Reader *reader) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

- void **store** (decaf::io::OutputStream *out, const std::string &comment) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

*Writes this property list (key and element pairs) in this **Properties** (p. 2140) table to the output stream in a format suitable for loading into a **Properties** (p. 2140) table using the load(InputStream) method.*

- void **store** (decaf::io::Writer *writer, const std::string &comments) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

*Writes this property list (key and element pairs) in this **Properties** (p. 2140) table to the output character stream in a format that can be read by the load(Reader) method.*

Protected Attributes

- std::auto_ptr< **Properties** > **defaults**

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.438.1 Detailed Description

Java-like properties class for mapping string names to string values. The **Properties** (p. 2140) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 2140) instance can contain an **internal** (p. 95) **Properties** (p. 2140) list that contains default values for keys not found in the **Properties** (p. 2140) **List** (p. 1591).

The **Properties** (p. 2140) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

Since:

1.0

6.438.2 Constructor & Destructor Documentation

6.438.2.1 `decaf::util::Properties::Properties ()`

6.438.2.2 `decaf::util::Properties::Properties (const Properties & src)`

6.438.2.3 `virtual decaf::util::Properties::~~Properties ()` [virtual]

6.438.3 Member Function Documentation

6.438.3.1 `void decaf::util::Properties::clear ()`

Clears all properties from the map.

6.438.3.2 `Properties* decaf::util::Properties::clone () const`

Clones this object.

Returns:

a replica of this object.

6.438.3.3 `void decaf::util::Properties::copy (const Properties & source)`

Copies the contents of the given properties object to this one, if the given **Properties** (p. 2140) instance is NULL then this **List** (p. 1591) is not modified.

Parameters:

source The source properties object.

6.438.3.4 `bool decaf::util::Properties::equals (const Properties & source) const`

Test whether two **Properties** (p. 2140) objects are equivalent. Two **Properties** (p. 2140) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

Parameters:

source The **Properties** (p. 2140) object to compare this instance to.

Returns:

true if the contents of the two **Properties** (p. 2140) objects are the same.

6.438.3.5 `std::string decaf::util::Properties::getProperty (const std::string & name, const std::string & default Value) const`

Looks up the value for the given property.

Parameters:

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns:

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

6.438.3.6 const char* decaf::util::Properties::getProperty (const std::string & *name*) const

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

Returns:

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Referenced by decaf::util::logging::LogManager::getProperty().

6.438.3.7 bool decaf::util::Properties::hasProperty (const std::string & *name*) const

Check to see if the Property exists in the set.

Parameters:

name - property name to check for in this properties set.

Returns:

true if property exists, false otherwise.

6.438.3.8 bool decaf::util::Properties::isEmpty () const

Returns true if the properties object is empty.

Returns:

true if empty

6.438.3.9 void decaf::util::Properties::load (decaf::io::Reader * *reader*) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format. **Properties** (p. 2140) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character `\`. Note that a comment line cannot be extended in this manner; every natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is ignored. A comment line has an ASCII `'#'` or `'!'` as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (`' '`), tab (`'\t'`), and form feed (`'\f'`) to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of the following line have no effect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of $2n$ contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped `'='`, `':'`, or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

```
\: \=
```

would be the two-character key `":="`. Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is `'='` or `':'`, then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string `""`. Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key `"Truth"` and the associated element value `"Beauty"`:

```
Truth = Beauty Truth:Beauty Truth :Beauty
```

As another example, the following three lines specify a single property:

```
fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango
```

The key is `"fruits"` and the associated element is: `"apple, banana, pear, cantaloupe, watermelon, kiwi, mango"`

Note that a space appears before each `\` so that a space will appear after each comma in the final result; the `\`, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

```
cheeses
```

specifies that the key is `"cheeses"` and the associated element is the empty string `""`.

Characters in keys and elements can be represented in escape sequences similar to those used

for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
- The character sequence **does** not represent a backspace character.
- The method does not treat a backslash character, `\`, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence `"\z"` would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence `"\b"` as equivalent to the single character `'b'`.
- Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

Parameters:

reader The Reader that provides an character stream as input.

Exceptions:

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

6.438.3.10 `void decaf::util::Properties::load (decaf::io::InputStream
* stream) throw (decaf::io::IOException, de-
caf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::NullPointerException)`

Reads a property list (key and element pairs) from the input byte stream. The input stream is in a simple line-oriented format as specified in `load(Reader)` and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

Parameters:

stream The stream to read the properties data from.

Exceptions:

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

6.438.3.11 Properties& decaf::util::Properties::operator= (const Properties & *src*)

Assignment Operator.

Parameters:

src The **Properties** (p. 2140) list to copy to this **List** (p. 1591).

Returns:

a reference to this **List** (p. 1591) for use in chaining.

6.438.3.12 void decaf::util::Properties::remove (const std::string & *name*)

Removes the property with the given name.

Parameters:

name the name of the property to remove.

6.438.3.13 void decaf::util::Properties::setProperty (const std::string & *name*, const std::string & *value*)

Sets the value for a given property. If the property already exists, overwrites the value.

Parameters:

name The name of the value to be written.

value The value to be written.

6.438.3.14 std::size_t decaf::util::Properties::size () const**Returns:**

The number of **Properties** (p. 2140) in this **Properties** (p. 2140) Object.

6.438.3.15 void decaf::util::Properties::store (decaf::io::Writer * *writer*, const std::string & *comments*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

Writes this property list (key and element pairs) in this **Properties** (p. 2140) table to the output character stream in a format that can be read by the load(Reader) method. **Properties** (p. 2140) from the defaults table of this **Properties** (p. 2140) table (if any) are not written out by this method.

If the comments argument is not empty, then an ASCII # character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed (

'), a carriage return ("), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the Writer and if the next character in comments is not character # or character ! then an ASCII # is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII `#` character, the current date and time (as if produced by the `toString` method of **Date** (p. 1179) for the current time), and a line separator as generated by the `Writer`.

Then every entry in this **Properties** (p. 2140) table is written out, one per line. For each entry the key string is written, then an ASCII `=`, then the associated element string. For the key, all space characters are written with a preceding `\` character. For the element, leading space characters, but not embedded or trailing space characters, are written with a preceding `\` character. The key and element characters `#`, `!`, `=`, and `:` are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters:

- writer* The `Writer` instance to use to output the properties.
- comments* A description of these properties that is written before writing the properties.

Exceptions:

- IOException* if there is an error while writing from the stream.
- NullPointerException* if the passed stream is `Null`.

6.438.3.16 `void decaf::util::Properties::store (decaf::io::OutputStream * out, const std::string & comment) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)`

Writes this property list (key and element pairs) in this **Properties** (p.2140) table to the output stream in a format suitable for loading into a **Properties** (p.2140) table using the `load(InputStream)` method. **Properties** (p. 2140) from the defaults table of this **Properties** (p. 2140) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in `store(Writer)`, with the following differences:

- The stream is written using the ISO 8859-1 character encoding.
- Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value `xxxx`.
- Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value `xxxx`.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters:

- out* The `OutputStream` instance to write the properties to.
- comment* A description of these properties that is written to the output stream.

Exceptions:

- IOException* if there is an error while writing from the stream.
- NullPointerException* if the passed stream is `Null`.

6.438.3.17 `std::vector< std::pair< std::string, std::string > >
decaf::util::Properties::toArray () const`

Method that serializes the contents of the property map to an array.

Returns:

list of pairs where the first is the name and the second is the value.

6.438.3.18 `std::string decaf::util::Properties::toString () const`

Formats the contents of the **Properties** (p. 2140) Object into a string that can be logged, etc.

Returns:

string value of this object.

6.438.4 Field Documentation

6.438.4.1 `std::auto_ptr<Properties> decaf::util::Properties::defaults [protected]`

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Properties.h`

6.439 decaf::util::logging::PropertiesChangeListener Class Reference

Defines the interface that classes can use to listen for change events on **Properties** (p. 2140).

6.440 decaf::net::ProtocolException Class Reference

#include <src/main/decaf/net/ProtocolException.h> Inheritance diagram for decaf::net::ProtocolException:

Public Member Functions

- **ProtocolException** () throw ()
Default Constructor.
- **ProtocolException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **ProtocolException** (const **ProtocolException** &ex) throw ()
Copy Constructor.
- **ProtocolException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ProtocolException** (const std::exception *cause) throw ()
Constructor.
- **ProtocolException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ProtocolException** * clone () const
Clones this exception.
- virtual ~**ProtocolException** () throw ()

6.440.1 Constructor & Destructor Documentation

6.440.1.1 decaf::net::ProtocolException::ProtocolException () throw () [inline]

Default Constructor.

6.440.1.2 decaf::net::ProtocolException::ProtocolException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.440.1.3 decaf::net::ProtocolException::ProtocolException (const ProtocolException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.440.1.4 decaf::net::ProtocolException::ProtocolException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.440.1.5 decaf::net::ProtocolException::ProtocolException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.440.1.6 decaf::net::ProtocolException::ProtocolException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.440.1.7 `virtual decaf::net::ProtocolException::~~ProtocolException () throw ()`
 `[inline, virtual]`

6.440.2 Member Function Documentation

6.440.2.1 `virtual ProtocolException* decaf::net::ProtocolException::clone () const`
 `[inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ProtocolException.h`

6.441 decaf::security::PublicKey Class Reference

A public key.

`#include <src/main/decaf/security/PublicKey.h>`
Inheritance diagram for decaf::security::PublicKey:

Public Member Functions

- virtual `~PublicKey ()`

6.441.1 Detailed Description

A public key. This interface contains no methods or constants. It merely serves to group (and provide type safety for) all public key interfaces.

6.441.2 Constructor & Destructor Documentation

6.441.2.1 virtual `decaf::security::PublicKey::~~PublicKey ()` [inline, virtual]

The documentation for this class was generated from the following file:

6.442 decaf::util::Queue< E > Class Template Reference

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

#include <src/main/decaf/util/Queue.h> Inheritance diagram for decaf::util::Queue< E >:

Public Member Functions

- virtual `~Queue ()`
- virtual `const E & getEmptyMarker () const =0`
*Returns a reference to the Marker value that is returned from methods that do not throw an exception when there is no element in the **Queue** (p. 2154) to return.*
- virtual `bool offer (const E &value)=0`
Inserts the specified element into the queue provided that the condition allows such an operation.
- virtual `E poll ()=0`
Gets and removes the element in the head of the queue, or returns null if there is no element in the queue.
- virtual `E remove ()=0 throw (decaf::lang::exceptions::NoSuchElementException)`
Gets and removes the element in the head of the queue.
- virtual `const E & peek () const =0`
Gets but not removes the element in the head of the queue.
- virtual `const E & element () const =0 throw (decaf::lang::exceptions::NoSuchElementException)`
Gets but not removes the element in the head of the queue.

6.442.1 Detailed Description

`template<typename E> class decaf::util::Queue< E >`

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection. Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

Queue (p. 2154) does not provide blocking queue methods, which will block until the operation of the method is allowed. BlockingQueue interface defines such methods.

Certain methods in the **Queue** (p. 2154) interface return a special value instead of throwing an exception if there is no element in the **Queue** (p. 2154) to return, this special value can be obtained by calling the **Queue** (p. 2154) method `getEmptyMarker`.

6.442.2 Constructor & Destructor Documentation

6.442.2.1 `template<typename E > virtual decaf::util::Queue< E >::~~Queue ()`
[inline, virtual]

6.442.3 Member Function Documentation

6.442.3.1 `template<typename E > virtual const E& decaf::util::Queue< E >::element () const throw (decaf::lang::exceptions::NoSuchElementException)` [pure virtual]

Gets but not removes the element in the head of the queue. Throws a `NoSuchElementException` if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException if there is no element in the queue.

Implemented in `decaf::util::AbstractQueue< E >` (p. 138).

6.442.3.2 `template<typename E > virtual const E& decaf::util::Queue< E >::getEmptyMarker () const` [pure virtual]

Returns a reference to the Marker value that is returned from methods that do not throw an exception when there is no element in the **Queue** (p. 2154) to return. The empty marker is usually an instance of the contained element initialized using the default constructor (if its a Class) or the default value for the primitive type.

Returns:

a value that indicates that the **Queue** (p. 2154) is empty.

Referenced by `decaf::util::AbstractQueue< E >::clear()`, `decaf::util::AbstractQueue< E >::element()`, and `decaf::util::AbstractQueue< E >::remove()`.

6.442.3.3 `template<typename E > virtual bool decaf::util::Queue< E >::offer (const E & value)` [pure virtual]

Inserts the specified element into the queue provided that the condition allows such an operation. The method is generally preferable to the `collection.add(E)`, since the latter might throw an exception if the operation fails.

Parameters:

value the specified element to insert into the queue.

Returns:

true if the operation succeeds and false if it fails.

Referenced by `decaf::util::AbstractQueue< E >::add()`.

6.442.3.4 `template<typename E > virtual const E& decaf::util::Queue< E >::peek
() const [pure virtual]`

Gets but not removes the element in the head of the queue.

Returns:

the element in the head of the queue or null if there is no element in the queue.

Referenced by `decaf::util::AbstractQueue< E >::element()`.

6.442.3.5 `template<typename E > virtual E decaf::util::Queue< E >::poll () [pure
virtual]`

Gets and removes the element in the head of the queue, or returns null if there is no element in the queue.

Returns:

the element in the head of the queue or null if there is no element in the queue.

Referenced by `decaf::util::AbstractQueue< E >::clear()`, and `decaf::util::AbstractQueue< E >::remove()`.

6.442.3.6 `template<typename E > virtual E decaf::util::Queue< E >::remove ()
throw (decaf::lang::exceptions::NoSuchElementException) [pure
virtual]`

Gets and removes the element in the head of the queue. Throws a `NoSuchElementException` if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException if there is no element in the queue.

Implemented in `decaf::util::AbstractQueue< E >` (p.138).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Queue.h`

6.443 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

#include <src/main/cms/Queue.h> Inheritance diagram for cms::Queue:

Public Member Functions

- virtual `~Queue ()`
- virtual `std::string getQueueName () const =0 throw (CMSEException)`
Gets the name of this queue.

6.443.1 Detailed Description

An interface encapsulating a provider-specific queue name. Messages sent to a **Queue** (p. 2157) are sent to a Single Subscriber on that **Queue** (p. 2157) **Destination** (p. 1190). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 1753) in a **Queue** (p. 2157) is not defined by the CMS API, consult your Provider documentation for this information.

Since:

1.0

6.443.2 Constructor & Destructor Documentation

6.443.2.1 virtual `cms::Queue::~Queue ()` [inline, virtual]

6.443.3 Member Function Documentation

6.443.3.1 virtual `std::string cms::Queue::getQueueName () const throw (CMSEException)` [pure virtual]

Gets the name of this queue.

Returns:

The queue name.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

Implemented in `activemq::commands::ActiveMQQueue` (p. 340).

The documentation for this class was generated from the following file:

- `src/main/cms/Queue.h`

6.444 cms::QueueBrowser Class Reference

This class implements in interface for browsing the messages in a **Queue** (p.2157) without removing them.

#include <src/main/cms/QueueBrowser.h> Inheritance diagram for cms::QueueBrowser:

Public Member Functions

- virtual **~QueueBrowser** ()
- virtual const **Queue** * **getQueue** () const =0 throw (cms::CMSEException)
- virtual std::string **getMessageSelector** () const =0 throw (cms::CMSEException)
- virtual std::vector< const **cms::Message** * > **getEnumeration** () const =0 throw (cms::CMSEException)

Gets an enumeration for browsing the current queue messages in the order they would be received.

6.444.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p.2157) without removing them. The **getEnumeration** method of this class returns a static snapshot of the **Queue** (p.2157) at the time the method is called. Since new Message's can be arriving and old Message's could expire the client should periodically refresh its view by calling **getEnumeration** again.

Since:

1.1

6.444.2 Constructor & Destructor Documentation

6.444.2.1 virtual cms::QueueBrowser::~~QueueBrowser () [inline, virtual]

6.444.3 Member Function Documentation

6.444.3.1 virtual std::vector<const cms::Message*>
cms::QueueBrowser::getEnumeration () const throw (
cms::CMSEException) [pure virtual]

Gets an enumeration for browsing the current queue messages in the order they would be received. The enumeration returned is a static view of the **Queue** (p.2157) and is not updated as new Messages arrive, the client should refresh its enumeration by calling this method again.

Returns:

an STL vector for browsing the messages.

Exceptions:

CMSEException (p. 850) if an internal error occurs.

6.444.3.2 virtual std::string cms::QueueBrowser::getMessageSelector () const
throw (cms::CMSEException) [pure virtual]

Returns:

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions:

CMSEException (p. 850) if an internal error occurs.

6.444.3.3 virtual const Queue* cms::QueueBrowser::getQueue () const throw (cms::CMSEException) [pure virtual]

Returns:

the **Queue** (p. 2157) that this browser is listening on.

Exceptions:

CMSEException (p. 850) if an internal error occurs.

- src/main/cms/QueueBrowser.h

6.445 decaf::util::Random Class Reference

Random (p. 2160) Value Generator which is used to generate a stream of pseudorandom numbers.

```
#include <src/main/decaf/util/Random.h>
```

Public Member Functions

- **Random** ()
Construct a random generator with the current time of day in milliseconds as the initial state.
- **Random** (unsigned long long seed)
Construct a random generator with the given `seed` as the initial state.
- bool **nextBoolean** ()
Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.
- void **nextBytes** (std::vector< unsigned char > &buf)
Modifies the byte array by a random sequence of bytes generated by this random number generator.
- double **nextDouble** ()
Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.
- float **nextFloat** ()
Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.
- double **nextGaussian** ()
Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of 1.0 using the polar method of G.
- int **nextInt** ()
Generates a uniformly distributed 32-bit `int` value from the this random number sequence.
- int **nextInt** (int n) throw (lang::exceptions::IllegalArgumentException)
Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).
- long long **nextLong** ()
Generates a uniformly distributed 64-bit `int` value from the this random number sequence.
- void **setSeed** (unsigned long long seed)
*Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2, Section 3.2.1*.*

Protected Member Functions

- virtual int **next** (int bits)
Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

6.445.1 Detailed Description

Random (p. 2160) Value Generator which is used to generate a stream of pseudorandom numbers. The algorithms implemented by class **Random** (p. 2160) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

Since:

1.0

6.445.2 Constructor & Destructor Documentation

6.445.2.1 decaf::util::Random::Random ()

Construct a random generator with the current time of day in milliseconds as the initial state.

See also:

`setSeed` (p. 2164)

6.445.2.2 decaf::util::Random::Random (unsigned long long *seed*)

Construct a random generator with the given *seed* as the initial state.

Parameters:

seed the seed that will determine the initial state of this random number generator

See also:

`setSeed` (p. 2164)

6.445.3 Member Function Documentation

6.445.3.1 virtual int decaf::util::Random::next (int *bits*) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument *bits* as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns:

`int` a pseudo-random generated `int` number

Parameters:

bits number of bits of the returned value

See also:

`nextBytes` (p. 2162)

`nextDouble` (p. 2162)

`nextFloat` (p. 2162)

`nextInt()` (p. 2163)

nextInt(int) (p. 2163)
nextGaussian (p. 2163)
nextLong (p. 2163)

6.445.3.2 **bool decaf::util::Random::nextBoolean ()**

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

Returns:

boolean a pseudo-random, uniformly distributed boolean value

6.445.3.3 **void decaf::util::Random::nextBytes (std::vector< unsigned char > & buf)**

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters:

buf non-null array to contain the new random bytes

See also:

next (p. 2161)

6.445.3.4 **double decaf::util::Random::nextDouble ()**

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

Returns:

double

See also:

nextFloat (p. 2162)

6.445.3.5 **float decaf::util::Random::nextFloat ()**

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

Returns:

float a random float number between 0.0 and 1.0

See also:

nextDouble (p. 2162)

6.445.3.6 double decaf::util::Random::nextGaussian ()

Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of 1.0 using the *polar method* of G. E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

Returns:

`double`

See also:

`nextDouble` (p. 2162)

6.445.3.7 int decaf::util::Random::nextInt (int *n*) throw (lang::exceptions::IllegalArgumentException)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

Returns:

`int`

Parameters:

n `int`

Exceptions:

IllegalArgumentException

6.445.3.8 int decaf::util::Random::nextInt ()

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

Returns:

int uniformly distributed `int` value

See also:

`next` (p. 2161)

`nextLong` (p. 2163)

6.445.3.9 long long decaf::util::Random::nextLong ()

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

Returns:

64-bit `int` random number

See also:

`next` (p. 2161)
`nextInt()` (p. 2163)
`nextInt(int)` (p. 2163)

6.445.3.10 `void decaf::util::Random::setSeed (unsigned long long seed)`

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters:

seed the seed that alters the state of the random number generator

See also:

`next` (p. 2161)
`Random()` (p. 2161)
`Random(long)`

6.446 decaf::io::Reader Class Reference

```
#include <src/main/decaf/io/Reader.h>
```

Public Member Functions

- virtual `~Reader ()`
- virtual void `setInputStream (InputStream *is)=0`
Sets the target input stream.
- virtual `InputStream * getInputStream ()=0`
Gets the target input stream.
- virtual `std::size_t read (unsigned char *buffer, std::size_t count)=0` throw (`IOException`, `lang::exceptions::NullPointerException`)
Attempts to read an array of bytes from the stream.
- virtual unsigned char `readByte ()=0` throw (`IOException`)
Attempts to read a byte from the input stream.

6.446.1 Constructor & Destructor Documentation

6.446.1.1 virtual `decaf::io::Reader::~~Reader ()` [inline, virtual]

6.446.2 Member Function Documentation

6.446.2.1 virtual `InputStream* decaf::io::Reader::getInputStream ()` [pure virtual]

Gets the target input stream.

6.446.2.2 virtual `std::size_t decaf::io::Reader::read (unsigned char * buffer, std::size_t count)` throw (`IOException`, `lang::exceptions::NullPointerException`) [pure virtual]

Attempts to read an array of bytes from the stream.

Parameters:

buffer The target byte buffer.
count The number of bytes to read.

Returns:

The number of bytes read.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

6.446.2.3 **virtual unsigned char decaf::io::Reader::readByte () throw (IOException)** [pure virtual]

Attempts to read a byte from the input stream.

Returns:

The byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

6.446.2.4 **virtual void decaf::io::Reader::setInputStream (InputStream * is)** [pure virtual]

Sets the target input stream.

[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::UnsupportedOperationException** (p. 2637).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**ReadOnlyBufferException.h**

6.448 decaf::util::concurrent::locks::ReadWriteLock Class Reference

A **ReadWriteLock** (p.2170) maintains a pair of associated **locks** (p.119), one for read-only operations and one for writing.

```
#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>
```

Public Member Functions

- virtual **~ReadWriteLock** ()
- virtual **Lock & readLock** ()=0
Returns the lock used for reading.
- virtual **Lock & writeLock** ()=0
Returns the lock used for writing.

6.448.1 Detailed Description

A **ReadWriteLock** (p.2170) maintains a pair of associated **locks** (p.119), one for read-only operations and one for writing. The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p.2170) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p.1618) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of code. Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

* Determining whether to grant the read lock or the write lock, when both readers and writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-lived as expected. Fair, or "in-order" implementations are also possible. * Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency. * Determining whether the **locks** (p. 119) are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant? * Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.

Since:

1.0

6.448.2 Constructor & Destructor Documentation

6.448.2.1 `virtual decaf::util::concurrent::locks::ReadWriteLock::~~ReadWriteLock ()`
[inline, virtual]

6.448.3 Member Function Documentation

6.448.3.1 `virtual Lock& decaf::util::concurrent::locks::ReadWriteLock::readLock ()`
[pure virtual]

Returns the lock used for reading.

Returns:

the lock used for reading.

6.448.3.2 `virtual Lock& decaf::util::concurrent::locks::ReadWriteLock::writeLock ()`
[pure virtual]

Returns the lock used for writing.

Returns:

the lock used for writing.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/locks/ReadWriteLock.h`

6.449 activemq::cmsutil::CmsTemplate::ReceiveExecutor Class Reference

#include <src/main/activemq/cmsutil/CmsTemplate.h> Inheritance diagram for activemq::cmsutil::CmsTemplate::ReceiveExecutor:

Public Member Functions

- **ReceiveExecutor** (**CmsTemplate** *parent, **cms::Destination** *destination, const std::string &selector, bool noLocal)
- virtual ~**ReceiveExecutor** ()
- virtual void **doInCms** (**cms::Session** *session) throw (cms::CMSException)
Execute any number of operations against the supplied CMS session.
- virtual **cms::Destination** * **getDestination** (**cms::Session** *session AMQCPP_UNUSED) throw (cms::CMSException)
- **cms::Message** * **getMessage** ()

Protected Attributes

- **cms::Destination** * destination
- std::string selector
- bool noLocal
- **cms::Message** * message
- **CmsTemplate** * parent

6.449.1 Constructor & Destructor Documentation

6.449.1.1 **activemq::cmsutil::CmsTemplate::ReceiveExecutor::ReceiveExecutor** (**CmsTemplate** * parent, **cms::Destination** * destination, const std::string & selector, bool noLocal) [inline]

6.449.1.2 virtual **activemq::cmsutil::CmsTemplate::ReceiveExecutor::~~ReceiveExecutor** () [inline, virtual]

6.449.2 Member Function Documentation

6.449.2.1 virtual void **activemq::cmsutil::CmsTemplate::ReceiveExecutor::doInCms** (**cms::Session** * session) throw (cms::CMSException) [virtual]

Execute any number of operations against the supplied CMS session.

Parameters:

session the CMS Session

Exceptions:

cms::CMSException (p. 850) if thrown by CMS API methods

Implements `activemq::cmsutil::SessionCallback` (p. 2283).

6.449.2.2 `virtual cms::Destination* activemq::cmsutil::CmsTemplate::ReceiveExecutor::getDestination (cms::Session *session AMQCPP_UNUSED) throw (cms::CMSException)` [inline, virtual]

6.449.2.3 `cms::Message* activemq::cmsutil::CmsTemplate::ReceiveExecutor::getMessage ()` [inline]

6.449.3 Field Documentation

6.449.3.1 `cms::Destination* activemq::cmsutil::CmsTemplate::ReceiveExecutor::destination` [protected]

6.449.3.2 `cms::Message* activemq::cmsutil::CmsTemplate::ReceiveExecutor::message` [protected]

6.449.3.3 `bool activemq::cmsutil::CmsTemplate::ReceiveExecutor::noLocal` [protected]

6.449.3.4 `CmsTemplate* activemq::cmsutil::CmsTemplate::ReceiveExecutor::parent` [protected]

6.449.3.5 `std::string activemq::cmsutil::CmsTemplate::ReceiveExecutor::selector` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CmsTemplate.h`

6.450 decaf::util::concurrent::RejectedExecutionException Class Reference

#include <src/main/decaf/util/concurrent/RejectedExecutionException.h> Inheritance diagram for decaf::util::concurrent::RejectedExecutionException:

Public Member Functions

- **RejectedExecutionException** () throw ()
Default Constructor.
- **RejectedExecutionException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **RejectedExecutionException** (const **RejectedExecutionException** &ex) throw ()
Copy Constructor.
- **RejectedExecutionException** (const std::exception *cause) throw ()
Constructor.
- **RejectedExecutionException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **RejectedExecutionException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **RejectedExecutionException** * clone () const
Clones this exception.
- virtual ~**RejectedExecutionException** () throw ()

6.450.1 Constructor & Destructor Documentation

6.450.1.1 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException () throw () [inline]

Default Constructor.

6.450.1.2 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.450.1.3 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const RejectedExecutionException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

References `decaf::lang::Exception::Exception()`.

6.450.1.4 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.450.1.5 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - list of primitives that are formatted into the message

6.450.1.6 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.450.1.7 **virtual**
decaf::util::concurrent::RejectedExecutionException::~RejectedExecutionException
() throw () [inline, virtual]

6.450.2 Member Function Documentation

6.450.2.1 **virtual RejectedExecutionException* de-**
caf::util::concurrent::RejectedExecutionException::clone ()
const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new instance this exception type with a copy the current state.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/RejectedExecutionException.h`

6.451 activemq::commands::RemoveInfo Class Reference

#include <src/main/activemq/commands/RemoveInfo.h> Inheritance diagram for activemq::commands::RemoveInfo:

Public Member Functions

- **RemoveInfo** ()
- virtual **~RemoveInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **RemoveInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **DataStructure** > & **getObjectId** () const
- virtual **Pointer**< **DataStructure** > & **getObjectId** ()
- virtual void **setObjectId** (const **Pointer**< **DataStructure** > &objectId)
- virtual bool **isRemoveInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REMOVEINFO** = 12

Protected Member Functions

- **RemoveInfo** (const **RemoveInfo** &)
- **RemoveInfo** & **operator=** (const **RemoveInfo** &)

Protected Attributes

- **Pointer**< **DataStructure** > **objectId**

6.451.1 Constructor & Destructor Documentation

6.451.1.1 `activemq::commands::RemoveInfo::RemoveInfo (const RemoveInfo &)`
[inline, protected]

6.451.1.2 `activemq::commands::RemoveInfo::RemoveInfo ()`

6.451.1.3 `virtual activemq::commands::RemoveInfo::~~RemoveInfo ()` [virtual]

6.451.2 Member Function Documentation

6.451.2.1 `virtual RemoveInfo* activemq::commands::RemoveInfo::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.451.2.2 `virtual void activemq::commands::RemoveInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.451.2.3 `virtual bool activemq::commands::RemoveInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.451.2.4 `virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType ()`
`const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataSet** (p. 1174) type copy.

Implements **activemq::commands::DataSet** (p. 1176).

6.451.2.5 `virtual Pointer<DataSet>& activemq::commands::RemoveInfo::getObjectId ()`
[virtual]

6.451.2.6 `virtual const Pointer<DataSet>& activemq::commands::RemoveInfo::getObjectId () const`
[virtual]

6.451.2.7 `virtual bool activemq::commands::RemoveInfo::isRemoveInfo () const`
[inline, virtual]

Returns:

an answer of true to the **isRemoveInfo()** (p. 2179) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 511).

6.451.2.8 `RemoveInfo& activemq::commands::RemoveInfo::operator= (const RemoveInfo &)` [inline, protected]

6.451.2.9 `virtual void activemq::commands::RemoveInfo::setObjectId (const Pointer< DataSet > & objectId)` [virtual]

6.451.2.10 `virtual std::string activemq::commands::RemoveInfo::toString () const`
[virtual]

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.451.2.11 `virtual Pointer<Command> activemq::commands::RemoveInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.451.3 Field Documentation

6.451.3.1 `const unsigned char activemq::commands::RemoveInfo::ID_REMOVEINFO = 12` [static]

6.451.3.2 `Pointer<DataStructure> activemq::commands::RemoveInfo::objectId` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/RemoveInfo.h`

6.452 activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2181).

#include <src/main/activemq/wireformat/openwire/marshal/v2/RemoveInfoMarshaller.h>Inheritance diagram for activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller:

Public Member Functions

- **RemoveInfoMarshaller** ()
- virtual **~RemoveInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.452.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2181). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.452.2 Constructor & Destructor Documentation

6.452.2.1 `activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::RemoveInfoMarshaller()` [inline]

6.452.2.2 `virtual activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::~~RemoveInfoMarshaller()` [inline, virtual]

6.452.3 Member Function Documentation

6.452.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.452.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.452.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.452.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.452.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]
