Chapter 2

Data Structure Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

activemq::core::ActiveMQAckHandler	145
activemq::core::ActiveMQConsumer	219
activemq::core::ActiveMQConstants	216
activemq::library::ActiveMQCPP	227
activemq::core::ActiveMQTransactionContext	481
decaf::lang::Appendable	484
decaf::nio::CharBuffer	817
decaf::internal::nio::CharArrayBuffer	809
decaf::internal::AprPool	486
decaf::util::concurrent::atomic::AtomicBoolean	488
decaf::lang::AtomicRefCounter	496
decaf::util::concurrent::atomic::AtomicReference< T >	498
binary_function	562
decaf::util::Comparator< Pointer< T, R > >	902
decaf::lang::PointerComparator< T, R >	2018
std::less< decaf::lang::Pointer< T > >	1590
activemq::wireformat::openwire::utils::BooleanStream	580
decaf::nio::Buffer	627
decaf::nio::ByteBuffer	734
decaf::internal::nio::ByteArrayBuffer	694
decaf::nio::CharBuffer	817
decaf::nio::DoubleBuffer	1250
decaf::internal::nio::DoubleArrayBuffer	1242
decaf::nio::FloatBuffer	1346
decaf::internal::nio::FloatArrayBuffer	1339
decaf::nio::IntBuffer	1417
decaf::internal::nio::IntArrayBuffer	1410
decaf::nio::LongBuffer	1674
decaf::internal::nio::LongArrayBuffer	1666
decaf::nio::ShortBuffer	2338
decaf::internal::nio::ShortArrayBuffer	2330

Chapter 3

Data Structure Index

3.1 Data Structures

Here are the data structures with brief descriptions:

decaf::util::AbstractCollection< E > (This class provides a skeletal implementation of the Collection (p. 871) interface, to minimize the effort required to implement this interface)	123
decaf::util::AbstractList< E > (This class provides a skeletal implementation of the List (p. 1591) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array))	134
decaf::util::AbstractMap< K, V, COMPARATOR > (This class provides a skeletal implementation of the Map (p. 1689) interface, to minimize the effort required to implement this interface)	135
decaf::util::AbstractQueue< E > (This class provides skeletal implementations of some Queue (p. 2154) operations)	136
decaf::util::AbstractSequentialList< E > (This class provides a skeletal implementation of the List (p. 1591) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list))	140
decaf::util::AbstractSet< E > (This class provides a skeletal implementation of the Set (p. 2320) interface to minimize the effort required to implement this interface)	141
activemq::transport::AbstractTransportFactory (Abstract implementation of the TransportFactory (p. 2614) interface, providing the base functionality that's common to most of the TransportFactory (p. 2614) instances)	143
activemq::core::ActiveMQAckHandler (Interface class that is used to give CMS Messages an interface to Ack themselves with)	145
activemq::commands::ActiveMQBlobMessage	146
activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQBlobMessageMarshaller (p. 151))	151
activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQBlobMessageMarshaller (p. 155))	155
activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQBlobMessageMarshaller (p. 159))	159
activemq::commands::ActiveMQBytesMessage	163

activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQBytesMessageMarshaller (p. 178))	178
activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQBytesMessageMarshaller (p. 182))	182
activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQBytesMessageMarshaller (p. 186))	186
activemq::core::ActiveMQConnection (Concrete connection used for all connectors to the ActiveMQ broker)	190
activemq::core::ActiveMQConnectionFactory	200
activemq::core::ActiveMQConnectionMetaData (This class houses all the various settings and information that is used by an instance of an ActiveMQConnection (p. 190) class)	205
activemq::core::ActiveMQConnectionSupport	209
activemq::core::ActiveMQConstants (Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back an forth between string and enum values)	216
activemq::core::ActiveMQConsumer	219
activemq::library::ActiveMQCPP	227
activemq::commands::ActiveMQDestination	229
activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller (Marshaling code for Open Wire Format for ActiveMQDestinationMarshaller (p. 240))	240
activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller (Marshaling code for Open Wire Format for ActiveMQDestinationMarshaller (p. 244))	244
activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller (Marshaling code for Open Wire Format for ActiveMQDestinationMarshaller (p. 248))	248
activemq::exceptions::ActiveMQException	252
activemq::commands::ActiveMQMapMessage	255
activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQMapMessageMarshaller (p. 267))	267
activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQMapMessageMarshaller (p. 271))	271
activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQMapMessageMarshaller (p. 275))	275
activemq::commands::ActiveMQMessage	279
activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQMessageMarshaller (p. 282))	282
activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQMessageMarshaller (p. 286))	286
activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQMessageMarshaller (p. 290))	290
activemq::commands::ActiveMQMessageTemplate< T >	294
activemq::commands::ActiveMQObjectMessage	310

activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQObjectMessageMarshaller (p. 313))	313
activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQObjectMessageMarshaller (p. 317))	317
activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQObjectMessageMarshaller (p. 321))	321
activemq::core::ActiveMQProducer	325
activemq::util::ActiveMQProperties (Implementation of the CMSProperties interface that delegates to a decaf::util::Properties (p. 2140) object)	332
activemq::commands::ActiveMQQueue	337
activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller (Marshaling code for Open Wire Format for ActiveMQQueueMarshaller (p. 341))	341
activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller (Marshaling code for Open Wire Format for ActiveMQQueueMarshaller (p. 345))	345
activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller (Marshaling code for Open Wire Format for ActiveMQQueueMarshaller (p. 349))	349
activemq::core::ActiveMQSession	353
activemq::core::ActiveMQSessionExecutor (Delegate dispatcher for a single session)	369
activemq::commands::ActiveMQStreamMessage	373
activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQStreamMessageMarshaller (p. 387))	387
activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQStreamMessageMarshaller (p. 391))	391
activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQStreamMessageMarshaller (p. 395))	395
activemq::commands::ActiveMQTempDestination	399
activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller (Marshaling code for Open Wire Format for ActiveMQTempDestinationMarshaller (p. 403))	403
activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller (Marshaling code for Open Wire Format for ActiveMQTempDestinationMarshaller (p. 407))	407
activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller (Marshaling code for Open Wire Format for ActiveMQTempDestinationMarshaller (p. 411))	411
activemq::commands::ActiveMQTempQueue	415
activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller (Marshaling code for Open Wire Format for ActiveMQTempQueueMarshaller (p. 420))	420
activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller (Marshaling code for Open Wire Format for ActiveMQTempQueueMarshaller (p. 424))	424
activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller (Marshaling code for Open Wire Format for ActiveMQTempQueueMarshaller (p. 428))	428

activemq::commands::ActiveMQTempTopic	432
activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller (Marshaling code for Open Wire Format for ActiveMQTempTopicMarshaller (p. 437))	437
activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller (Marshaling code for Open Wire Format for ActiveMQTempTopicMarshaller (p. 441))	441
activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller (Marshaling code for Open Wire Format for ActiveMQTempTopicMarshaller (p. 445))	445
activemq::commands::ActiveMQTextMessage	449
activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQTextMessageMarshaller (p. 453))	453
activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQTextMessageMarshaller (p. 457))	457
activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller (Marshaling code for Open Wire Format for ActiveMQTextMessageMarshaller (p. 461))	461
activemq::commands::ActiveMQTopic	465
activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller (Marshaling code for Open Wire Format for ActiveMQTopicMarshaller (p. 469))	469
activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller (Marshaling code for Open Wire Format for ActiveMQTopicMarshaller (p. 473))	473
activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller (Marshaling code for Open Wire Format for ActiveMQTopicMarshaller (p. 477))	477
activemq::core::ActiveMQTransactionContext (Transaction Management class, hold messages that are to be redelivered upon a request to roll-back)	481
decaf::lang::Appendable	484
decaf::internal::AprPool (Wraps an APR pool object so that classes in decaf (p. 94) can create a static member for use in static methods where apr function calls that need a pool are made)	486
decaf::util::concurrent::atomic::AtomicBoolean (A boolean value that may be updated atomically)	488
decaf::util::concurrent::atomic::AtomicInteger (An int value that may be updated atomically)	491
decaf::lang::AtomicRefCounter	496
decaf::util::concurrent::atomic::AtomicReference< T > (An Pointer reference that may be updated atomically)	498
activemq::transport::failover::BackupTransport	501
activemq::transport::failover::BackupTransportPool	504
activemq::commands::BaseCommand	507
activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller (Marshaling code for Open Wire Format for BaseCommandMarshaller (p. 514))	514
activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller (Marshaling code for Open Wire Format for BaseCommandMarshaller (p. 521))	521

activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller (Marshaling code for Open Wire Format for BaseCommandMarshaller (p. 528))	528
activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller (Base class for all Marshallers that marshal (p. 76) DataStructures to and from the wire using the OpenWire protocol)	535
activemq::commands::BaseDataStructure	557
binary_function	562
decaf::net::BindException	563
decaf::io::BlockingByteArrayInputStream (This is a blocking version of a byte buffer stream)	566
decaf::lang::Boolean	573
activemq::commands::BooleanExpression	578
activemq::wireformat::openwire::utils::BooleanStream (Manages the writing and reading of boolean data streams to and from a data source such as a DataInput- Stream or DataOutputStream)	580
decaf::util::concurrent::BrokenBarrierException	583
activemq::commands::BrokerError (This class represents an Exception sent from the Broker)	586
activemq::exceptions::BrokerException	590
activemq::commands::BrokerId	592
activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller (Marshaling code for Open Wire Format for BrokerIdMarshaller (p. 595))	595
activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller (Marshaling code for Open Wire Format for BrokerIdMarshaller (p. 599))	599
activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller (Marshaling code for Open Wire Format for BrokerIdMarshaller (p. 603))	603
activemq::commands::BrokerInfo	607
activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller (Marshal- ing code for Open Wire Format for BrokerInfoMarshaller (p. 615))	615
activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller (Marshal- ing code for Open Wire Format for BrokerInfoMarshaller (p. 619))	619
activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller (Marshal- ing code for Open Wire Format for BrokerInfoMarshaller (p. 623))	623
decaf::nio::Buffer (A container for data of a specific primitive type)	627
decaf::io::BufferedInputStream (A wrapper around another input stream that per- forms a buffered read, where it reads more data than it needs in order to reduce the number of io (p. 100) operations on the input stream)	633
decaf::io::BufferedOutputStream (Wrapper around another output stream that buffers output before writing to the target output stream)	638
decaf::net::BufferedSocket (Buffered Socket (p. 2371) class that wraps a Socket (p. 2371) derived object and provides Buffered input and Output Streams to improve the efficiency of the reads and writes)	641
decaf::internal::nio::BufferFactory (Factory class used by static methods in the de- caf::nio (p. 106) package to create the various default version of the NIO inter- faces)	648
decaf::nio::BufferOverflowException	658
decaf::nio::BufferUnderflowException	661
decaf::lang::Byte	664
decaf::internal::util::ByteArrayAdapter (This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data)	673
decaf::internal::nio::ByteArrayBuffer (This class defines six categories of operations upon byte buffers:)	694

decaf::io::ByteArrayInputStream (Simple implementation of InputStream (p.1406) that wraps around an STL Vector <code>std::vector<unsigned char></code>) . . .	716
decaf::io::ByteArrayOutputStream	723
decaf::internal::nio::ByteArrayPerspective (This class extends ByteArray to create a reference counted byte array that can be held and used by several different ByteBuffers and allow them to know on destruction whose job it is to delete the perspective)	729
decaf::nio::ByteBuffer (This class defines six categories of operations upon byte buffers:)	734
cms::BytesMessage (A BytesMessage (p.759) object is used to send a message containing a stream of unsigned bytes)	759
activemq::cmsutil::CachedConsumer (A cached message consumer contained within a pooled session)	773
activemq::cmsutil::CachedProducer (A cached message producer contained within a pooled session)	777
decaf::util::concurrent::Callable< V >	783
decaf::util::concurrent::CancellationException	784
decaf::security::cert::Certificate (Base interface for all identity certificates)	787
decaf::security::cert::CertificateEncodingException	791
decaf::security::cert::CertificateException	793
decaf::security::cert::CertificateExpiredException	795
decaf::security::cert::CertificateNotYetValidException	797
decaf::security::cert::CertificateParsingException	799
decaf::lang::Character	801
decaf::internal::nio::CharArrayBuffer	809
decaf::nio::CharBuffer (This class defines four categories of operations upon character buffers:)	817
decaf::lang::CharSequence (A CharSequence (p.833) is a readable sequence of char values)	833
decaf::lang::exceptions::ClassCastException	835
cms::Closeable (Interface for a class that implements the close method)	838
decaf::io::Closeable (Interface for a class that implements the close method)	840
activemq::transport::failover::CloseTransportsTask	841
activemq::cmsutil::CmsAccessor (Base class for activemq.cmsutil.CmsTemplate (p.858) and other CMS-accessing gateway helpers, defining common properties such as the CMS cms.ConnectionFactory (p.978) to operate on)	843
activemq::cmsutil::CmsDestinationAccessor (Extends the CmsAccessor (p.843) to add support for resolving destination names)	847
cms::CMSException (CMS API Exception that is the base for all exceptions thrown from CMS classes)	850
cms::CMSProperties (Interface for a Java-like properties object)	853
cms::CMSSecurityException (This exception must be thrown when a provider rejects a user name/password submitted by a client)	857
activemq::cmsutil::CmsTemplate (CmsTemplate (p.858) simplifies performing synchronous CMS operations)	858
decaf::util::Collection< E > (The root interface in the collection hierarchy)	871
activemq::commands::Command	879
activemq::state::CommandVisitor (Interface for an Object that can visit the various Command Objects that are sent from and to this client)	885
activemq::state::CommandVisitorAdapter (Default Implementation of a CommandVisitor (p.885) that returns NULL for all calls)	893
decaf::lang::Comparable< T > (This interface imposes a total ordering on the objects of each class that implements it)	899

decaf::util::Comparator< T > (A comparison function, which imposes a total ordering on some collection of objects)	902
activemq::util::CompositeData (Represents a Composite URI)	904
activemq::threads::CompositeTask (Represents a single task that can be part of a set of Tasks that are contained in a CompositeTaskRunner (p. 908))	906
activemq::threads::CompositeTaskRunner (A Task (p. 2520) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added)	908
activemq::transport::CompositeTransport (A Composite Transport (p. 2608) is a Transport (p. 2608) implementation that is composed of several Transports)	911
decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR > (Interface for a Map (p. 1689) type that provides additional atomic (p. 118) putIfAbsent , remove , and replace methods alongside the already available Map (p. 1689) interface)	913
decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (Map (p. 1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map)	918
decaf::util::concurrent::locks::Condition (Condition (p. 932) factors out the Mutex (p. 1921) monitor methods (wait , notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary Lock (p. 1618) implementations)	932
decaf::net::ConnectException	938
cms::Connection (The client's connection to its provider)	941
activemq::commands::ConnectionControl	945
activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller (Marshaling code for Open Wire Format for ConnectionControlMarshaller (p. 950))	950
activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller (Marshaling code for Open Wire Format for ConnectionControlMarshaller (p. 954))	954
activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller (Marshaling code for Open Wire Format for ConnectionControlMarshaller (p. 958))	958
activemq::commands::ConnectionError	962
activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller (Marshaling code for Open Wire Format for ConnectionErrorMarshaller (p. 966))	966
activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller (Marshaling code for Open Wire Format for ConnectionErrorMarshaller (p. 970))	970
activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller (Marshaling code for Open Wire Format for ConnectionErrorMarshaller (p. 974))	974
cms::ConnectionFactory (Defines the interface for a factory that creates connection objects, the Connection (p. 941) objects returned implement the CMS Connection (p. 941) interface and hide the CMS Provider specific implementation details behind that interface)	978
activemq::commands::ConnectionId	981
activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller (Marshaling code for Open Wire Format for ConnectionIdMarshaller (p. 985))	985
activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller (Marshaling code for Open Wire Format for ConnectionIdMarshaller (p. 989))	989
activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller (Marshaling code for Open Wire Format for ConnectionIdMarshaller (p. 993))	993

activemq::commands::ConnectionInfo	997
activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller (Marshaling code for Open Wire Format for ConnectionInfoMarshaller (p. 1003))	1003
activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller (Marshaling code for Open Wire Format for ConnectionInfoMarshaller (p. 1007))	1007
activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller (Marshaling code for Open Wire Format for ConnectionInfoMarshaller (p. 1011))	1011
cms::ConnectionMetaData (A ConnectionMetaData (p. 1015) object provides in- formation describing the Connection (p. 941) object)	1015
activemq::state::ConnectionState	1019
activemq::state::ConnectionStateTracker	1022
activemq::commands::ConsumerControl	1028
activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller (Marshaling code for Open Wire Format for ConsumerControlMarshaller (p. 1033))	1033
activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller (Marshaling code for Open Wire Format for ConsumerControlMarshaller (p. 1037))	1037
activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller (Marshaling code for Open Wire Format for ConsumerControlMarshaller (p. 1041))	1041
activemq::commands::ConsumerId	1045
activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller (Mar- shaling code for Open Wire Format for ConsumerIdMarshaller (p. 1050))	1050
activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller (Mar- shaling code for Open Wire Format for ConsumerIdMarshaller (p. 1054))	1054
activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller (Mar- shaling code for Open Wire Format for ConsumerIdMarshaller (p. 1058))	1058
activemq::commands::ConsumerInfo	1062
activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller (Mar- shaling code for Open Wire Format for ConsumerInfoMarshaller (p. 1070))	1070
activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller (Mar- shaling code for Open Wire Format for ConsumerInfoMarshaller (p. 1074))	1074
activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller (Mar- shaling code for Open Wire Format for ConsumerInfoMarshaller (p. 1078))	1078
activemq::state::ConsumerState	1082
activemq::commands::ControlCommand	1083
activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller (Marshaling code for Open Wire Format for ControlCommandMarshaller (p. 1087))	1087
activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller (Marshaling code for Open Wire Format for ControlCommandMarshaller (p. 1091))	1091

activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller (Marshaling code for Open Wire Format for ControlCommandMarshaller (p. 1095))	1095
decaf::util::concurrent::CountDownLatch	1099
activemq::commands::DataArrayResponse	1101
activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller (Marshaling code for Open Wire Format for DataArrayResponseMarshaller (p. 1104))	1104
activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller (Marshaling code for Open Wire Format for DataArrayResponseMarshaller (p. 1108))	1108
activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller (Marshaling code for Open Wire Format for DataArrayResponseMarshaller (p. 1112))	1112
decaf::io::DataInputStream (A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way)	1116
decaf::io::DataOutputStream (A data output stream lets an application write prim- itive Java data types to an output stream in a portable way)	1125
activemq::commands::DataResponse	1132
activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller (Mar- shaling code for Open Wire Format for DataResponseMarshaller (p. 1135))	1135
activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller (Mar- shaling code for Open Wire Format for DataResponseMarshaller (p. 1139))	1139
activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller (Mar- shaling code for Open Wire Format for DataResponseMarshaller (p. 1143))	1143
activemq::wireformat::openwire::marshal::DataStreamMarshaller (Base class for all classes that marshal (p. 76) commands (p. 59) for Openwire)	1147
activemq::commands::DataStructure	1174
decaf::util::Date (Wrapper class around a time value in milliseconds)	1179
decaf::internal::DecafRuntime (Handles APR initialization and termination)	1182
activemq::threads::DedicatedTaskRunner	1183
activemq::transport::DefaultTransportListener	1185
decaf::util::concurrent::Delayed (A mix-in style interface for marking objects that should be acted upon after a given delay)	1187
cms::DeliveryMode (This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages)	1188
cms::Destination (A Destination (p. 1190) object encapsulates a provider-specific ad- dress)	1190
activemq::commands::ActiveMQDestination::DestinationFilter	1193
activemq::commands::DestinationInfo	1194
activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller (Marshaling code for Open Wire Format for DestinationInfoMarshaller (p. 1199))	1199
activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller (Marshaling code for Open Wire Format for DestinationInfoMarshaller (p. 1203))	1203
activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller (Marshaling code for Open Wire Format for DestinationInfoMarshaller (p. 1207))	1207
activemq::cmsutil::DestinationResolver (Resolves a CMS destination name to a Destination)	1211

activemq::commands::DiscoveryEvent	1213
activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller (Marshaling code for Open Wire Format for DiscoveryEventMarshaller (p. 1217))	1217
activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller (Marshaling code for Open Wire Format for DiscoveryEventMarshaller (p. 1221))	1221
activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller (Marshaling code for Open Wire Format for DiscoveryEventMarshaller (p. 1225))	1225
activemq::core::DispatchData (Simple POJO that contains the information necessary to route a message to a specified consumer)	1229
activemq::core::Dispatcher (Interface for an object responsible for dispatching messages to consumers)	1230
decaf::lang::Double	1231
decaf::internal::nio::DoubleArrayBuffer	1242
decaf::nio::DoubleBuffer (This class defines four categories of operations upon double buffers:)	1250
decaf::lang::DYNAMIC_CAST_TOKEN	1261
activemq::cmsutil::DynamicDestinationResolver (Resolves a CMS destination name to a Destination)	1262
decaf::util::Map< K, V, COMPARATOR >::Entry	1264
decaf::io::EOFException	1265
decaf::lang::Exception	1268
cms::ExceptionListener (If a CMS provider detects a serious problem, it notifies the client application through an ExceptionListener (p. 1275) that is registered with the Connection (p. 941))	1275
activemq::commands::ExceptionResponse	1276
activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller (Marshaling code for Open Wire Format for ExceptionResponseMarshaller (p. 1279))	1279
activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller (Marshaling code for Open Wire Format for ExceptionResponseMarshaller (p. 1283))	1283
activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller (Marshaling code for Open Wire Format for ExceptionResponseMarshaller (p. 1287))	1287
decaf::util::concurrent::ExecutionException	1291
decaf::util::concurrent::Executor (An object that executes submitted decaf.lang Runnable (p. 2256) tasks)	1294
activemq::transport::failover::FailoverTransport	1296
activemq::transport::failover::FailoverTransportFactory (Creates an instance of a FailoverTransport (p. 1296))	1308
activemq::transport::failover::FailoverTransportListener (Utility class used by the Transport (p. 2608) to perform the work of responding to events from the active Transport (p. 2608))	1311
decaf::util::logging::Filter (A Filter (p. 1314) can be used to provide fine grain control over what is logged, beyond the control provided by log levels)	1314
decaf::io::FilterInputStream (A FilterInputStream (p. 1315) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality)	1315
decaf::io::FilterOutputStream (This class is the superclass of all classes that filter output streams)	1322
decaf::lang::Float	1328

decaf::internal::nio::FloatArrayBuffer	1339
decaf::nio::FloatBuffer (This class defines four categories of operations upon float buffers:)	1346
activemq::commands::FlushCommand	1357
activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller (Marshaling code for Open Wire Format for FlushCommandMarshaller (p. 1360))	1360
activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller (Marshaling code for Open Wire Format for FlushCommandMarshaller (p. 1364))	1364
activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller (Marshaling code for Open Wire Format for FlushCommandMarshaller (p. 1368))	1368
decaf::util::logging::Formatter (A Formatter (p. 1372) provides support for formatting LogRecords)	1372
decaf::util::concurrent::Future< V > (A Future (p. 1374) represents the result of an asynchronous computation)	1374
activemq::transport::correlator::FutureResponse (A container that holds a response object)	1377
decaf::security::GeneralSecurityException	1379
decaf::util::logging::Handler (A Handler (p. 1382) object takes log messages from a Logger (p. 1623) and exports them)	1382
decaf::internal::util::HexStringParser	1386
activemq::wireformat::openwire::utils::HexTable (Maps hexadecimal strings to the value of an index into the table, i.e)	1388
decaf::net::HttpRetryException	1390
decaf::lang::exceptions::IllegalArgumentException	1393
decaf::lang::exceptions::IllegalMonitorStateException	1396
cms::IllegalStateException (This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation)	1399
decaf::lang::exceptions::IllegalStateException	1400
decaf::lang::exceptions::IndexOutOfBoundsException	1403
decaf::io::InputStream (Base interface for an input stream)	1406
decaf::internal::nio::IntArrayBuffer	1410
decaf::nio::IntBuffer (This class defines four categories of operations upon int buffers:)	1417
decaf::lang::Integer	1428
activemq::commands::IntegerResponse	1442
activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller (Marshaling code for Open Wire Format for IntegerResponseMarshaller (p. 1445))	1445
activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller (Marshaling code for Open Wire Format for IntegerResponseMarshaller (p. 1449))	1449
activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller (Marshaling code for Open Wire Format for IntegerResponseMarshaller (p. 1453))	1453
activemq::transport::mock::InternalCommandListener (Listens for Commands sent from the MockTransport (p. 1910))	1457
decaf::lang::exceptions::InterruptedException	1459
decaf::io::InterruptedException	1462
cms::InvalidClientIdException (This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider)	1465

cms::InvalidDestinationException (This exception must be thrown when a destination either is not understood by a provider or is no longer valid)	1466
decaf::security::InvalidKeyException	1467
decaf::nio::InvalidMarkException	1470
cms::InvalidSelectorException (This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax)	1473
decaf::lang::exceptions::InvalidStateException	1474
decaf::io::IOException	1477
activemq::transport::IOTransport (Implementation of the Transport (p. 2608) interface that performs marshaling of commands (p. 59) to IO streams)	1480
decaf::lang::Iterable< E > (Implementing this interface allows an object to be cast to an Iterable (p. 1487) type for generic collections API calls)	1487
decaf::util::Iterator< T > (Defines an object that can be used to iterate over the elements of a collection)	1489
activemq::commands::JournalQueueAck	1491
activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller (Marshaling code for Open Wire Format for JournalQueueAckMarshaller (p. 1495))	1495
activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller (Marshaling code for Open Wire Format for JournalQueueAckMarshaller (p. 1499))	1499
activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller (Marshaling code for Open Wire Format for JournalQueueAckMarshaller (p. 1503))	1503
activemq::commands::JournalTopicAck	1507
activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller (Marshaling code for Open Wire Format for JournalTopicAckMarshaller (p. 1512))	1512
activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller (Marshaling code for Open Wire Format for JournalTopicAckMarshaller (p. 1516))	1516
activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller (Marshaling code for Open Wire Format for JournalTopicAckMarshaller (p. 1520))	1520
activemq::commands::JournalTrace	1524
activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller (Marshaling code for Open Wire Format for JournalTraceMarshaller (p. 1527))	1527
activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller (Marshaling code for Open Wire Format for JournalTraceMarshaller (p. 1531))	1531
activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller (Marshaling code for Open Wire Format for JournalTraceMarshaller (p. 1535))	1535
activemq::commands::JournalTransaction	1539
activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller (Marshaling code for Open Wire Format for JournalTransactionMarshaller (p. 1543))	1543
activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller (Marshaling code for Open Wire Format for JournalTransactionMarshaller (p. 1547))	1547
activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller (Marshaling code for Open Wire Format for JournalTransactionMarshaller (p. 1551))	1551

activemq::commands::KeepAliveInfo	1555
activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller (Marshaling code for Open Wire Format for KeepAliveInfoMarshaller (p. 1558))	1558
activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller (Marshaling code for Open Wire Format for KeepAliveInfoMarshaller (p. 1562))	1562
activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller (Marshaling code for Open Wire Format for KeepAliveInfoMarshaller (p. 1566))	1566
decaf::security::Key (The Key (p. 1570) interface is the top-level interface for all keys)	1570
decaf::security::KeyException	1572
activemq::commands::LastPartialCommand	1575
activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller (Marshaling code for Open Wire Format for LastPartialCommandMarshaller (p. 1578))	1578
activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller (Marshaling code for Open Wire Format for LastPartialCommandMarshaller (p. 1582))	1582
activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller (Marshaling code for Open Wire Format for LastPartialCommandMarshaller (p. 1586))	1586
std::less< decaf::lang::Pointer< T > > (An override of the less function object so that the Pointer objects can be stored in STL Maps, etc)	1590
decaf::util::List< E > (An ordered collection (also known as a sequence))	1591
decaf::util::ListIterator< E > (An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list)	1597
activemq::commands::LocalTransactionId	1600
activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller (Marshaling code for Open Wire Format for LocalTransactionIdMarshaller (p. 1604))	1604
activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller (Marshaling code for Open Wire Format for LocalTransactionIdMarshaller (p. 1608))	1608
activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller (Marshaling code for Open Wire Format for LocalTransactionIdMarshaller (p. 1612))	1612
decaf::util::concurrent::Lock (A wrapper class around a given synchronization mechanism that provides automatic release upon destruction)	1616
decaf::util::concurrent::locks::Lock (Lock (p. 1618) implementations provide more extensive locking operations than can be obtained using synchronized statements)	1618
decaf::util::logging::Logger	1623
decaf::util::logging::LoggerHierarchy	1632
activemq::io::LoggingInputStream	1633
activemq::io::LoggingOutputStream (OutputStream filter that just logs the data being written)	1635
activemq::transport::logging::LoggingTransport (A transport (p. 67) filter that logs commands (p. 59) as they are sent/received)	1637
decaf::util::logging::LogManager (There is a single global LogManager (p. 1640) object that is used to maintain a set of shared state about Loggers and log services)	1640
decaf::util::logging::LogRecord	1645
decaf::util::logging::LogWriter	1650

decaf::lang::Long	1652
decaf::internal::nio::LongArrayBuffer	1666
decaf::nio::LongBuffer (This class defines four categories of operations upon long long buffers:)	1674
activemq::util::LongSequenceGenerator (This class is used to generate a sequence of long long values that are incremented each time a new value is requested)	1685
decaf::net::MalformedURLException	1686
decaf::util::Map< K, V, COMPARATOR > (Map (p.1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map)	1689
cms::MapMessage (A MapMessage (p.1701) object is used to send a set of name-value pairs)	1701
decaf::util::logging::MarkBlockLogger (Defines a class that can be used to mark the entry and exit from scoped blocks)	1711
activemq::wireformat::MarshalAware	1712
activemq::wireformat::openwire::marshal::v2::MarshallerFactory (Used to create marshallers for a specific version of the wire protocol)	1715
activemq::wireformat::openwire::marshal::v3::MarshallerFactory (Used to create marshallers for a specific version of the wire protocol)	1716
activemq::wireformat::openwire::marshal::v1::MarshallerFactory (Used to create marshallers for a specific version of the wire protocol)	1717
decaf::lang::Math (The class Math (p.1718) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions)	1718
activemq::util::MemoryUsage	1733
activemq::commands::Message	1737
cms::Message (Root of all messages)	1753
activemq::commands::MessageAck	1777
activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller (Marshaling code for Open Wire Format for MessageAckMarshaller (p.1783))	1783
activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller (Marshaling code for Open Wire Format for MessageAckMarshaller (p.1787))	1787
activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller (Marshaling code for Open Wire Format for MessageAckMarshaller (p.1791))	1791
cms::MessageConsumer (A client uses a MessageConsumer (p.1795) to received messages from a destination)	1795
activemq::cmsutil::MessageCreator (Creates the user-defined message to be sent by the CmsTemplate (p.858))	1799
activemq::commands::MessageDispatch	1800
activemq::core::MessageDispatchChannel	1805
activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller (Marshaling code for Open Wire Format for MessageDispatchMarshaller (p.1811))	1811
activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller (Marshaling code for Open Wire Format for MessageDispatchMarshaller (p.1815))	1815
activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller (Marshaling code for Open Wire Format for MessageDispatchMarshaller (p.1819))	1819
activemq::commands::MessageDispatchNotification	1823

activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller (Marshaling code for Open Wire Format for MessageDispatchNotificationMarshaller (p. 1829))	1829
activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller (Marshaling code for Open Wire Format for MessageDispatchNotificationMarshaller (p. 1833))	1833
activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller (Marshaling code for Open Wire Format for MessageDispatchNotificationMarshaller (p. 1837))	1837
cms::MessageEOFException (This exception must be thrown when an unexpected end of stream has been reached when a StreamMessage (p. 2476) or BytesMessage (p. 759) is being read)	1841
cms::MessageFormatException (This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type)	1842
activemq::commands::MessageId	1843
activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller (Marshaling code for Open Wire Format for MessageIdMarshaller (p. 1848))	1848
activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller (Marshaling code for Open Wire Format for MessageIdMarshaller (p. 1852))	1852
activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller (Marshaling code for Open Wire Format for MessageIdMarshaller (p. 1856))	1856
cms::MessageListener (A MessageListener (p. 1860) object is used to receive asynchronously delivered messages)	1860
activemq::wireformat::openwire::marshal::v2::MessageMarshaller (Marshaling code for Open Wire Format for MessageMarshaller (p. 1861))	1861
activemq::wireformat::openwire::marshal::v3::MessageMarshaller (Marshaling code for Open Wire Format for MessageMarshaller (p. 1866))	1866
activemq::wireformat::openwire::marshal::v1::MessageMarshaller (Marshaling code for Open Wire Format for MessageMarshaller (p. 1871))	1871
cms::MessageNotReadableException (This exception must be thrown when a CMS client attempts to read a write-only message)	1876
cms::MessageNotWriteableException (This exception must be thrown when a CMS client attempts to write to a read-only message)	1877
cms::MessageProducer (A client uses a MessageProducer (p. 1878) object to send messages to a Destination (p. 1190))	1878
activemq::wireformat::openwire::utils::MessagePropertyInterceptor (Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties)	1885
activemq::commands::MessagePull	1893
activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller (Marshaling code for Open Wire Format for MessagePullMarshaller (p. 1898))	1898
activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller (Marshaling code for Open Wire Format for MessagePullMarshaller (p. 1902))	1902
activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller (Marshaling code for Open Wire Format for MessagePullMarshaller (p. 1906))	1906
activemq::transport::mock::MockTransport (The MockTransport (p. 1910) defines a base level Transport (p. 2608) class that is intended to be used in place of an a regular protocol Transport (p. 2608) such as TCP)	1910

activemq::transport::mock::MockTransportFactory (Manufactures MockTransports, which are objects that read from input streams and write to output streams)	1918
decaf::util::concurrent::Mutex (Creates a pthread_mutex_t object)	1921
activemq::commands::NetworkBridgeFilter	1924
activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller (Marshaling code for Open Wire Format for NetworkBridgeFilterMarshaller (p.1927))	1927
activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller (Marshaling code for Open Wire Format for NetworkBridgeFilterMarshaller (p.1931))	1931
activemq::wireformat::openwire::marshal::v1::NetworkBridgeFilterMarshaller (Marshaling code for Open Wire Format for NetworkBridgeFilterMarshaller (p.1935))	1935
decaf::net::NoRouteToHostException	1939
decaf::security::NoSuchAlgorithmException	1942
decaf::lang::exceptions::NoSuchElementException	1945
decaf::security::NoSuchProviderException	1948
decaf::lang::exceptions::NullPointerException	1951
decaf::lang::Number (The abstract class Number (p.1954) is the superclass of classes Byte (p.664), Double (p.1231), Float (p.1328), Integer (p.1428), Long (p.1652), and Short (p.2321))	1954
decaf::lang::exceptions::NumberFormatException	1957
cms::ObjectMessage (Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object) . . .	1960
decaf::security_provider::unix::openssl::OpenSSLX500Principal (The OpenSSLX500Principal (p.1961) wraps around an OpenSSL X509_NAME structure)	1961
decaf::security_provider::unix::openssl::OpenSSLX509Certificate	1964
activemq::wireformat::openwire::OpenWireFormat	1970
activemq::wireformat::openwire::OpenWireFormatFactory	1982
activemq::wireformat::openwire::OpenWireFormatNegotiator	1984
activemq::wireformat::openwire::OpenWireResponseBuilder	1988
activemq::wireformat::openwire::utils::OpenWireStringSupport	1990
decaf::io::OutputStream (Base interface for an output stream)	1992
activemq::commands::PartialCommand	1995
activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller (Marshaling code for Open Wire Format for PartialCommandMarshaller (p.1999))	1999
activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller (Marshaling code for Open Wire Format for PartialCommandMarshaller (p.2003))	2003
activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller (Marshaling code for Open Wire Format for PartialCommandMarshaller (p.2007))	2007
decaf::lang::Pointer< T, REFCOUNTER > (Decaf's implementation of a Smart Pointer (p.2011) that is a template on a Type and is Thread (p.2544) Safe if the default Reference Counter is used)	2011
decaf::lang::PointerComparator< T, R > (This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the Pointer (p.2011) instance)	2018
activemq::cmsutil::PooledSession (A pooled session object that wraps around a delegate session)	2019

decaf::util::concurrent::PooledThread	2032
decaf::util::concurrent::PooledThreadListener (Abstract Listener Interface for users of ThreadPool (p. 2549))	2035
decaf::net::PortUnreachableException	2037
activemq::util::PrimitiveList (List of primitives)	2040
activemq::util::PrimitiveMap (Map of named primitives)	2051
activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller (This class wraps the functionality needed to marshal (p. 76) a primitive map to the Openwire Format's expectation of what the map looks like on the wire)	2061
activemq::util::PrimitiveValueNode::PrimitiveValue (Define a union type comprised of the various types)	2066
activemq::util::PrimitiveValueConverter (Class controls the conversion of data contained in a PrimitiveValueNode (p. 2070) from one type to another)	2068
activemq::util::PrimitiveValueNode (Class that wraps around a single value of one of the many types)	2070
decaf::security::Principal (Base interface for a principal, which can represent an individual or organization)	2084
activemq::commands::ProducerAck	2086
activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller (Marshaling code for Open Wire Format for ProducerAckMarshaller (p. 2090))	2090
activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller (Marshaling code for Open Wire Format for ProducerAckMarshaller (p. 2094))	2094
activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller (Marshaling code for Open Wire Format for ProducerAckMarshaller (p. 2098))	2098
activemq::cmsutil::ProducerCallback (Callback for sending a message to a CMS destination)	2102
activemq::cmsutil::CmsTemplate::ProducerExecutor	2103
activemq::commands::ProducerId	2105
activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller (Marshaling code for Open Wire Format for ProducerIdMarshaller (p. 2110))	2110
activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller (Marshaling code for Open Wire Format for ProducerIdMarshaller (p. 2114))	2114
activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller (Marshaling code for Open Wire Format for ProducerIdMarshaller (p. 2118))	2118
activemq::commands::ProducerInfo	2122
activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller (Marshaling code for Open Wire Format for ProducerInfoMarshaller (p. 2127))	2127
activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller (Marshaling code for Open Wire Format for ProducerInfoMarshaller (p. 2131))	2131
activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller (Marshaling code for Open Wire Format for ProducerInfoMarshaller (p. 2135))	2135
activemq::state::ProducerState	2139
decaf::util::Properties (Java-like properties class for mapping string names to string values)	2140

decaf::util::logging::PropertiesChangeListener (Defines the interface that classes can use to listen for change events on Properties (p. 2140))	2149
decaf::net::ProtocolException	2150
decaf::security::PublicKey (A public key)	2153
decaf::util::Queue< E > (A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection)	2154
cms::Queue (An interface encapsulating a provider-specific queue name)	2157
cms::QueueBrowser (This class implements in interface for browsing the messages in a Queue (p. 2157) without removing them)	2158
decaf::util::Random (Random (p. 2160) Value Generator which is used to generate a stream of pseudorandom numbers)	2160
decaf::io::Reader	2165
decaf::nio::ReadOnlyBufferException	2167
decaf::util::concurrent::locks::ReadWriteLock (A ReadWriteLock (p. 2170) maintains a pair of associated locks (p. 119), one for read-only operations and one for writing)	2170
activemq::cmsutil::CmsTemplate::ReceiveExecutor	2172
decaf::util::concurrent::RejectedExecutionException	2174
activemq::commands::RemoveInfo	2177
activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller (Marshaling code for Open Wire Format for RemoveInfoMarshaller (p. 2181))	2181
activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller (Marshaling code for Open Wire Format for RemoveInfoMarshaller (p. 2185))	2185
activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller (Marshaling code for Open Wire Format for RemoveInfoMarshaller (p. 2189))	2189
activemq::commands::RemoveSubscriptionInfo	2193
activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller (Marshaling code for Open Wire Format for RemoveSubscriptionInfoMarshaller (p. 2198))	2198
activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller (Marshaling code for Open Wire Format for RemoveSubscriptionInfoMarshaller (p. 2202))	2202
activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller (Marshaling code for Open Wire Format for RemoveSubscriptionInfoMarshaller (p. 2206))	2206
activemq::commands::ReplayCommand	2210
activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller (Marshaling code for Open Wire Format for ReplayCommandMarshaller (p. 2214))	2214
activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller (Marshaling code for Open Wire Format for ReplayCommandMarshaller (p. 2218))	2218
activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller (Marshaling code for Open Wire Format for ReplayCommandMarshaller (p. 2222))	2222
activemq::cmsutil::CmsTemplate::ResolveProducerExecutor	2226
activemq::cmsutil::CmsTemplate::ResolveReceiveExecutor	2227
activemq::cmsutil::ResourceLifecycleManager (Manages the lifecycle of a set of CMS resources)	2228
activemq::commands::Response	2231

activemq::transport::mock::ResponseBuilder (Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol)	2235
activemq::transport::correlator::ResponseCorrelator (This type of transport (p. 67) filter is responsible for correlating asynchronous responses with requests)	2237
activemq::wireformat::openwire::marshal::v2::ResponseMarshaller (Marshaling code for Open Wire Format for ResponseMarshaller (p. 2241))	2241
activemq::wireformat::openwire::marshal::v3::ResponseMarshaller (Marshaling code for Open Wire Format for ResponseMarshaller (p. 2246))	2246
activemq::wireformat::openwire::marshal::v1::ResponseMarshaller (Marshaling code for Open Wire Format for ResponseMarshaller (p. 2251))	2251
decaf::lang::Runnable (Interface for a runnable object - defines a task that can be run by a thread)	2256
decaf::lang::Runtime	2257
decaf::lang::exceptions::RuntimeException	2259
decaf::security_provider::SecurityProvider	2262
decaf::security_provider::SecurityProviderMap (Lookup Map for Connector Factories)	2263
decaf::security_provider::SecurityProviderRegistrar (Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour))	2265
activemq::cmsutil::CmsTemplate::SendExecutor	2267
decaf::net::ServerSocket (A server socket class (for testing purposes))	2268
cms::Session (A Session (p. 2270) object is a single-threaded context for producing and consuming messages)	2270
activemq::cmsutil::SessionCallback (Callback for executing any number of operations on a provided CMS Session)	2283
activemq::commands::SessionId	2284
activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller (Marshaling code for Open Wire Format for SessionIdMarshaller (p. 2288))	2288
activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller (Marshaling code for Open Wire Format for SessionIdMarshaller (p. 2292))	2292
activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller (Marshaling code for Open Wire Format for SessionIdMarshaller (p. 2296))	2296
activemq::commands::SessionInfo	2300
activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller (Marshaling code for Open Wire Format for SessionInfoMarshaller (p. 2304))	2304
activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller (Marshaling code for Open Wire Format for SessionInfoMarshaller (p. 2308))	2308
activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller (Marshaling code for Open Wire Format for SessionInfoMarshaller (p. 2312))	2312
activemq::cmsutil::SessionPool (A pool of CMS sessions from the same connection and with the same acknowledge mode)	2316
activemq::state::SessionState	2318
decaf::util::Set< E > (A collection that contains no duplicate elements)	2320
decaf::lang::Short	2321
decaf::internal::nio::ShortArrayBuffer	2330
decaf::nio::ShortBuffer (This class defines four categories of operations upon short buffers:)	2338
activemq::commands::ShutdownInfo	2349
activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller (Marshaling code for Open Wire Format for ShutdownInfoMarshaller (p. 2352))	2352

activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller (Marshaling code for Open Wire Format for ShutdownInfoMarshaller (p. 2356))	2356
activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller (Marshaling code for Open Wire Format for ShutdownInfoMarshaller (p. 2360))	2360
decaf::security::SignatureException	2364
decaf::util::logging::SimpleFormatter (Print a brief summary of the LogRecord (p. 1645) in a human readable format)	2367
decaf::util::logging::SimpleLogger	2369
decaf::net::Socket	2371
decaf::net::SocketError (Static utility class to simplify handling of error codes for socket operations)	2378
decaf::net::SocketException (Exception for errors when manipulating sockets)	2379
decaf::net::SocketFactory (Socket (p. 2371) Factory implementation for use in Creating Sockets)	2382
decaf::net::SocketInputStream (Input stream for performing reads on a socket)	2384
decaf::net::SocketOutputStream (Output stream for performing write operations on a socket)	2390
decaf::net::SocketTimeoutException	2395
activemq::commands::BrokerError::StackTraceElement	2398
decaf::internal::io::StandardErrorOutputStream (Wrapper Around the Standard error Output facility on the current platform)	2399
decaf::internal::io::StandardInputStream	2403
decaf::internal::io::StandardOutputStream	2409
cms::Startable (Interface for a class that implements the start method)	2413
decaf::lang::STATIC_CAST_TOKEN	2414
activemq::core::ActiveMQConstants::StaticInitializer	2415
decaf::util::StlList< E > (List (p. 1591) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type)	2416
decaf::util::StlMap< K, V, COMPARATOR > (Map (p. 1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map)	2429
decaf::util::StlQueue< T > (The Queue (p. 2154) class accepts messages with an psuh(m) command where m is the message to be queued)	2440
decaf::util::StlSet< E > (Set (p. 2320) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set)	2446
activemq::wireformat::stomp::StompCommandConstants	2452
activemq::wireformat::stomp::StompFrame (A Stomp-level message frame that encloses all messages to and from the broker)	2456
activemq::wireformat::stomp::StompHelper (Utility Methods used when marshaling to and from StompFrame's)	2461
activemq::wireformat::stomp::StompWireFormat	2466
activemq::wireformat::stomp::StompWireFormatFactory (Factory used to create the Stomp Wire Format instance)	2470
cms::Stoppable (Interface for a class that implements the stop method)	2471
decaf::util::logging::StreamHandler	2472
cms::StreamMessage (Interface for a StreamMessage (p. 2476))	2476
decaf::util::StringTokenizer	2488
activemq::commands::SubscriptionInfo	2491
activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller (Marshaling code for Open Wire Format for SubscriptionInfoMarshaller (p. 2496))	2496

activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller (Marshaling code for Open Wire Format for SubscriptionInfoMarshaller (p. 2500))	2500
activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller (Marshaling code for Open Wire Format for SubscriptionInfoMarshaller (p. 2504))	2504
decaf::util::concurrent::Synchronizable (The interface for all synchronizable objects (that is, objects that can be locked and unlocked))	2508
activemq::core::Synchronization (Transacted Object Synchronization (p. 2516), used to sync the events of a Transaction with the items in the Transaction)	2516
decaf::lang::System	2517
activemq::threads::Task (Represents a unit of work that requires one or more iterations to complete)	2520
decaf::util::concurrent::TaskListener	2521
activemq::threads::TaskRunner	2522
decaf::net::TcpSocket (Platform-independent implementation of the socket interface)	2524
activemq::transport::tcp::TcpTransport (Implements a TCP/IP based transport (p. 67) filter, this transport (p. 67) is meant to wrap an instance of an IO-Transport (p. 1480))	2532
activemq::transport::tcp::TcpTransportFactory (Factory Responsible for creating the TcpTransport (p. 2532))	2535
cms::TemporaryQueue (Defines a Temporary Queue (p. 2157) based Destination (p. 1190))	2538
cms::TemporaryTopic (Defines a Temporary Topic (p. 2571) based Destination (p. 1190))	2540
cms::TextMessage (Interface for a text message)	2542
decaf::lang::Thread (Basic thread class - mimics the Java Thread (p. 2544))	2544
decaf::util::concurrent::ThreadFactory (Public interface ThreadFactory (p. 2547))	2547
decaf::util::concurrent::ThreadPool (Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks)	2549
decaf::lang::Throwable (This class represents an error that has occurred)	2555
decaf::util::concurrent::TimeoutException	2559
decaf::util::concurrent::TimeUnit (A TimeUnit (p. 2562) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units)	2562
cms::Topic (An interface encapsulating a provider-specific topic name)	2571
activemq::state::Tracked	2572
activemq::commands::TransactionId	2573
activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller (Mar- shaling code for Open Wire Format for TransactionIdMarshaller (p. 2577))	2577
activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller (Mar- shaling code for Open Wire Format for TransactionIdMarshaller (p. 2581))	2581
activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller (Mar- shaling code for Open Wire Format for TransactionIdMarshaller (p. 2585))	2585
activemq::commands::TransactionInfo	2589
activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller (Marshaling code for Open Wire Format for TransactionInfoMarshaller (p. 2594))	2594

activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller (Marshaling code for Open Wire Format for TransactionInfoMarshaller (p. 2598))	2598
activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller (Marshaling code for Open Wire Format for TransactionInfoMarshaller (p. 2602))	2602
activemq::state::TransactionState	2606
activemq::transport::Transport (Interface for a transport (p. 67) layer for command objects)	2608
activemq::transport::TransportFactory (Defines the interface for Factories that cre- ate Transports or TransportFilters)	2614
activemq::transport::TransportFilter (A filter on the transport (p. 67) layer) . .	2616
activemq::transport::TransportListener (A listener of asynchronous exceptions (p. 62) from a command transport (p. 67) object)	2624
activemq::transport::TransportRegistry (Registry of all Transport (p. 2608) Fac- tories that are available to the client at runtime)	2626
decaf::net::UnknownHostException	2629
decaf::net::UnknownServiceException	2632
decaf::lang::exceptions::UnsupportedOperationException	2635
decaf::net::URI (This class represents an instance of a URI (p. 2638) as defined by RFC 2396)	2638
decaf::internal::net::URIEncoderDecoder	2649
decaf::internal::net::URIHelper (Helper class used by the URI classes in encoding and decoding of URIs)	2652
activemq::transport::failover::URIPool	2659
activemq::util::URISupport	2662
decaf::net::URISyntaxException	2665
decaf::internal::net::URIType (Basic type object that holds data that composes a given URI)	2669
decaf::net::URL (Class URL (p. 2677) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web)	2677
decaf::net::URLDecoder	2679
decaf::net::URLEncoder	2680
activemq::util::Usage	2681
decaf::io::UTFDataFormatException (Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered)	2683
decaf::util::UUID (A class that represents an immutable universally unique identifier (UUID (p. 2686)))	2686
activemq::wireformat::WireFormat (Provides a mechanism to marshal commands (p. 59) into and out of packets or into and out of streams, Channels and Data- grams)	2693
activemq::wireformat::WireFormatFactory (The WireFormatFactory (p. 2697) is the interface that all WireFormatFactory (p. 2697) classes must extend) .	2697
activemq::commands::WireFormatInfo	2699
activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller (Marshaling code for Open Wire Format for WireFormatInfoMarshaller (p. 2709))	2709
activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller (Marshaling code for Open Wire Format for WireFormatInfoMarshaller (p. 2713))	2713
activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller (Marshaling code for Open Wire Format for WireFormatInfoMarshaller (p. 2717))	2717

activemq::wireformat::WireFormatNegotiator (Defines a WireFormatNegotiator (p. 2721) which allows a WireFormat (p. 2693) to)	2721
activemq::wireformat::WireFormatRegistry (Registry of all WireFormat (p. 2693) Factories that are available to the client at runtime)	2722
decaf::io::Writer	2725
decaf::security::auth::x500::X500Principal	2727
decaf::security::cert::X509Certificate (Base interface for all identity certificates)	2728
activemq::commands::XATransactionId	2731
activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller (Marshaling code for Open Wire Format for XATransactionIdMarshaller (p. 2736))	2736
activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller (Marshaling code for Open Wire Format for XATransactionIdMarshaller (p. 2740))	2740
activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller (Marshaling code for Open Wire Format for XATransactionIdMarshaller (p. 2744))	2744

Chapter 4

File Index

4.1 File List

Here is a list of all files with brief descriptions:

src/main/activemq/cmsutil/	CachedConsumer.h	2749
src/main/activemq/cmsutil/	CachedProducer.h	2750
src/main/activemq/cmsutil/	CmsAccessor.h	2751
src/main/activemq/cmsutil/	CmsDestinationAccessor.h	2752
src/main/activemq/cmsutil/	CmsTemplate.h	2753
src/main/activemq/cmsutil/	DestinationResolver.h	2754
src/main/activemq/cmsutil/	DynamicDestinationResolver.h	2755

5.2 activemq::cmsutil Namespace Reference

Data Structures

- class **CachedConsumer**
A cached message consumer contained within a pooled session.
- class **CachedProducer**
A cached message producer contained within a pooled session.
- class **CmsAccessor**
Base class for `activemq.cmsutil.CmsTemplate` (p. 858) and other CMS-accessing gateway helpers, defining common properties such as the CMS `cms.ConnectionFactory` (p. 978) to operate on.
- class **CmsDestinationAccessor**
Extends the `CmsAccessor` (p. 843) to add support for resolving destination names.
- class **CmsTemplate**
`CmsTemplate` (p. 858) simplifies performing synchronous CMS operations.
- class **DestinationResolver**
Resolves a CMS destination name to a `Destination`.
- class **DynamicDestinationResolver**
Resolves a CMS destination name to a `Destination`.
- class **MessageCreator**
Creates the user-defined message to be sent by the `CmsTemplate` (p. 858).
- class **PooledSession**
A pooled session object that wraps around a delegate session.
- class **ProducerCallback**
Callback for sending a message to a CMS destination.
- class **ResourceLifecycleManager**
Manages the lifecycle of a set of CMS resources.
- class **SessionCallback**
Callback for executing any number of operations on a provided CMS Session.
- class **SessionPool**
A pool of CMS sessions from the same connection and with the same acknowledge mode.

5.3 activemq::commands Namespace Reference

Data Structures

- class **ActiveMQBlobMessage**
- class **ActiveMQBytesMessage**
- class **ActiveMQDestination**
- class **ActiveMQMapMessage**

- class **ShutdownInfo**
- class **SubscriptionInfo**
- class **TransactionId**
- class **TransactionInfo**
- class **WireFormatInfo**
- class **XATransactionId**

5.4 activemq::core Namespace Reference

Data Structures

- class **ActiveMQAckHandler**

Interface class that is used to give CMS Messages an interface to Ack themselves with.

- class **ActiveMQConnection**

Concrete connection used for all connectors to the ActiveMQ broker.

- class **ActiveMQConnectionFactory**

- class **ActiveMQConnectionMetaData**

*This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 190) class.*

- class **ActiveMQConnectionSupport**

- class **ActiveMQConstants**

Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back and forth between string and enum values.

- class **ActiveMQConsumer**

- class **ActiveMQProducer**

- class **ActiveMQSession**

- class **ActiveMQSessionExecutor**

Delegate dispatcher for a single session.

- class **ActiveMQTransactionContext**

Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.

- class **DispatchData**

Simple POJO that contains the information necessary to route a message to a specified consumer.

- class **Dispatcher**

Interface for an object responsible for dispatching messages to consumers.

- class **MessageDispatchChannel**

- class **Synchronization**

*Transacted Object **Synchronization** (p. 2516), used to sync the events of a Transaction with the items in the Transaction.*

5.5 activemq::exceptions Namespace Reference

Data Structures

- class **ActiveMQException**
- class **BrokerException**

5.6 activemq::io Namespace Reference

Data Structures

- class **LoggingInputStream**
- class **LoggingOutputStream**

OutputStream filter that just logs the data being written.

5.7 activemq::library Namespace Reference

Data Structures

- class `ActiveMQCPP`

5.8 activemq::state Namespace Reference

Data Structures

- class **CommandVisitor**

Interface for an Object that can visit the various Command Objects that are sent from and to this client.

- class **CommandVisitorAdapter**

*Default Implementation of a **CommandVisitor** (p. 885) that returns NULL for all calls.*

- class **ConnectionState**
- class **ConnectionStateTracker**
- class **ConsumerState**
- class **ProducerState**
- class **SessionState**
- class **Tracked**
- class **TransactionState**

5.9 activemq::threads Namespace Reference

Data Structures

- class **CompositeTask**

Represents a single task that can be part of a set of Tasks that are contained in a `CompositeTaskRunner` (p. 908).

- class **CompositeTaskRunner**

*A **Task** (p. 2520) Runner that can contain one or more `CompositeTasks` that are each checked for pending work and run if any is present in the order that the tasks were added.*

- class **DedicatedTaskRunner**

- class **Task**

Represents a unit of work that requires one or more iterations to complete.

- class **TaskRunner**

5.10 activemq::transport Namespace Reference

Namespaces

- namespace **correlator**
- namespace **failover**
- namespace **logging**
- namespace **mock**
- namespace **tcp**

Data Structures

- class **AbstractTransportFactory**
*Abstract implementation of the **TransportFactory** (p. 2614) interface, providing the base functionality that's common to most of the **TransportFactory** (p. 2614) instances.*
- class **CompositeTransport**
*A Composite **Transport** (p. 2608) is a **Transport** (p. 2608) implementation that is composed of several **Transports**.*
- class **DefaultTransportListener**
- class **IOTransport**
*Implementation of the **Transport** (p. 2608) interface that performs marshaling of **commands** (p. 59) to IO streams.*
- class **Transport**
*Interface for a **transport** (p. 67) layer for command objects.*
- class **TransportFactory**
*Defines the interface for **Factories** that create **Transports** or **TransportFilters**.*
- class **TransportFilter**
*A filter on the **transport** (p. 67) layer.*
- class **TransportListener**
*A listener of asynchronous **exceptions** (p. 62) from a command **transport** (p. 67) object.*
- class **TransportRegistry**
*Registry of all **Transport** (p. 2608) **Factories** that are available to the client at runtime.*

5.11 activemq::transport::correlator Namespace Reference

Data Structures

- class **FutureResponse**

A container that holds a response object.

- class **ResponseCorrelator**

*This type of **transport** (p. 67) filter is responsible for correlating asynchronous responses with requests.*

5.12 activemq::transport::failover Namespace Reference

Data Structures

- class **BackupTransport**
- class **BackupTransportPool**
- class **CloseTransportsTask**
- class **FailoverTransport**
- class **FailoverTransportFactory**

*Creates an instance of a **FailoverTransport** (p. 1296).*

- class **FailoverTransportListener**

*Utility class used by the **Transport** (p. 2608) to perform the work of responding to events from the active **Transport** (p. 2608).*

- class **URIPool**

5.13 activemq::transport::logging Namespace Reference

Data Structures

- class **LoggingTransport**

*A **transport** (p. 67) filter that logs **commands** (p. 59) as they are sent/received.*

5.14 activemq::transport::mock Namespace Reference

Data Structures

- class **InternalCommandListener**

*Listens for Commands sent from the **MockTransport** (p. 1910).*

- class **MockTransport**

*The **MockTransport** (p. 1910) defines a base level **Transport** (p. 2608) class that is intended to be used in place of an a regular protocol **Transport** (p. 2608) such as TCP.*

- class **MockTransportFactory**

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

- class **ResponseBuilder**

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

5.15 activemq::transport::tcp Namespace Reference

Data Structures

- class **TcpTransport**

*Implements a TCP/IP based **transport** (p. 67) filter, this **transport** (p. 67) is meant to wrap an instance of an **IOTransport** (p. 1480).*

- class **TcpTransportFactory**

*Factory Responsible for creating the **TcpTransport** (p. 2532).*

5.16 activemq::util Namespace Reference

Data Structures

- class **ActiveMQProperties**

*Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2140) object.*

- class **CompositeData**

Represents a Composite URI.

- class **LongSequenceGenerator**

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

- class **MemoryUsage**

- class **PrimitiveList**

List of primitives.

- class **PrimitiveMap**

Map of named primitives.

- class **PrimitiveValueConverter**

*Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2070) from one type to another.*

- class **PrimitiveValueNode**

Class that wraps around a single value of one of the many types.

- class **URISupport**

- class **Usage**

5.17 activemq::wireformat Namespace Reference

Namespaces

- namespace **openwire**
- namespace **stomp**

Data Structures

- class **MarshalAware**
- class **WireFormat**
*Provides a mechanism to marshal **commands** (p. 59) into and out of packets or into and out of streams, Channels and Datagrams.*
- class **WireFormatFactory**
*The **WireFormatFactory** (p. 2697) is the interface that all **WireFormatFactory** (p. 2697) classes must extend.*
- class **WireFormatNegotiator**
*Defines a **WireFormatNegotiator** (p. 2721) which allows a **WireFormat** (p. 2693) to.*
- class **WireFormatRegistry**
*Registry of all **WireFormat** (p. 2693) Factories that are available to the client at runtime.*

5.18 activemq::wireformat::openwire Namespace Reference

- namespace **marshal**
- namespace **utils**

Data Structures

- class **OpenWireFormat**
- class **OpenWireFormatFactory**
- class **OpenWireFormatNegotiator**
- class **OpenWireResponseBuilder**

5.19 activemq::wireformat::openwire::marshal Namespace Reference

Namespaces

- namespace **v1**
- namespace **v2**
- namespace **v3**

Data Structures

- class **BaseDataStreamMarshaller**

*Base class for all Marshallers that **marshal** (p. 76) DataStructures to and from the wire using the OpenWire protocol.*

- class **DataStreamMarshaller**

*Base class for all classes that **marshal** (p. 76) **commands** (p. 59) for Openwire.*

- class **PrimitiveTypesMarshaller**

*This class wraps the functionality needed to **marshal** (p. 76) a primitive map to the Openwire Format's expectation of what the map looks like on the wire.*

5.20 activemq:wireformat::openwire::marshal:v1 Namespace Reference

Data Structures

- class **ActiveMQBlobMessageMarshaller**

- class **TransactionInfoMarshaller**

*Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 2598).*

- class **WireFormatInfoMarshaller**

*Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2709).*

- class **XATransactionIdMarshaller**

*Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2740).*

5.23 activemq::wireformat::openwire::utils Namespace Reference

Data Structures

- class **BooleanStream**

Manages the writing and reading of boolean data streams to and from a data source such as a `DataInputStream` or `DataOutputStream`.

- class **HexTable**

*The **HexTable** (p. 1388) class maps hexadecimal strings to the value of an index into the table, i.e.*

- class **MessagePropertyInterceptor**

Used the base `ActiveMQMessage` class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the `OpenWireMessage` properties.

- class **OpenwireStringSupport**

5.24 activemq::wireformat::stomp Namespace Reference

Data Structures

- class **StompCommandConstants**
- class **StompFrame**

A Stomp-level message frame that encloses all messages to and from the broker.

- class **StompHelper**

Utility Methods used when marshaling to and from StompFrame's.

- class **StompWireFormat**
- class **StompWireFormatFactory**

Factory used to create the Stomp Wire Format instance.

5.25 cms Namespace Reference

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

Data Structures

- class **BytesMessage**

*A **BytesMessage** (p. 759) object is used to send a message containing a stream of unsigned bytes.*

- class **Closeable**

Interface for a class that implements the close method.

- class **CMSException**

CMS API Exception that is the base for all exceptions thrown from CMS classes.

- class **CMSProperties**

Interface for a Java-like properties object.

- class **CMSSecurityException**

This exception must be thrown when a provider rejects a user name/password submitted by a client.

- class **Connection**

The client's connection to its provider.

- class **ConnectionFactory**

*Defines the interface for a factory that creates connection objects, the **Connection** (p. 941) objects returned implement the CMS **Connection** (p. 941) interface and hide the CMS Provider specific implementation details behind that interface.*

- class **ConnectionMetaData**

*A **ConnectionMetaData** (p. 1015) object provides information describing the **Connection** (p. 941) object.*

- class **DeliveryMode**

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

- class **Destination**

*A **Destination** (p. 1190) object encapsulates a provider-specific address.*

- class **ExceptionListener**

*If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 1275) that is registered with the **Connection** (p. 941).*

- class **IllegalStateException**

This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

- class **InvalidClientIdException**

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

- class **InvalidDestinationException**

This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

- class **InvalidSelectorException**

This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

- class **MapMessage**

*A **MapMessage** (p. 1701) object is used to send a set of name-value pairs.*

- class **Message**

Root of all messages.

- class **MessageConsumer**

*A client uses a **MessageConsumer** (p. 1795) to received messages from a destination.*

- class **MessageEOFException**

*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2476) or **BytesMessage** (p. 759) is being read.*

- class **MessageFormatException**

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

- class **MessageListener**

*A **MessageListener** (p. 1860) object is used to receive asynchronously delivered messages.*

- class **MessageNotReadableException**

This exception must be thrown when a CMS client attempts to read a write-only message.

- class **MessageNotWriteableException**

This exception must be thrown when a CMS client attempts to write to a read-only message.

- class **MessageProducer**

*A client uses a **MessageProducer** (p. 1878) object to send messages to a **Destination** (p. 1190).*

- class **ObjectMessage**

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

- class **Queue**

An interface encapsulating a provider-specific queue name.

- class **QueueBrowser**

*This class implements in interface for browsing the messages in a **Queue** (p. 2157) without removing them.*

- class **Session**
*A **Session** (p. 2270) object is a single-threaded context for producing and consuming messages.*
- class **Startable**
Interface for a class that implements the start method.
- class **Stoppable**
Interface for a class that implements the stop method.
- class **StreamMessage**
*Interface for a **StreamMessage** (p. 2476).*
- class **TemporaryQueue**
*Defines a Temporary **Queue** (p. 2157) based **Destination** (p. 1190).*
- class **TemporaryTopic**
*Defines a Temporary **Topic** (p. 2571) based **Destination** (p. 1190).*
- class **TextMessage**
Interface for a text message.
- class **Topic**
An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **io**
- namespace **net**
- namespace **nio**
- namespace **util**

Data Structures

- class **AprPool**
*Wraps an APR pool object so that classes in **decaf** (p. 94) can create a static member for use in static methods where **apr** function calls that need a pool are made.*
- class **DecafRuntime**
Handles APR initialization and termination.

5.28 decaf::internal::io Namespace Reference

Data Structures

- class **StandardErrorOutputStream**

Wrapper Around the Standard error Output facility on the current platform.

- class **StandardInputStream**
- class **StandardOutputStream**

5.29 decaf::internal::net Namespace Reference

Data Structures

- class **URIEncoderDecoder**
- class **URIHelper**

Helper class used by the URI classes in encoding and decoding of URI's.

- class **URIType**

Basic type object that holds data that composes a given URI.

5.30 `decaf::internal::nio` Namespace Reference

Data Structures

- class **BufferFactory**

Factory class used by static methods in the `decaf::nio` (p. 106) package to create the various default version of the NIO interfaces.

- class **ByteBuffer**

This class defines six categories of operations upon byte buffers:.

- class **ByteArrayPerspective**

This class extends `ByteArray` to create a reference counted byte array that can be held and used by several different `ByteBuffers` and allow them to know on destruction whose job it is to delete the perspective.

- class **CharArrayBuffer**
- class **DoubleArrayBuffer**
- class **FloatArrayBuffer**
- class **IntArrayBuffer**
- class **LongArrayBuffer**
- class **ShortArrayBuffer**

5.31 decaf::internal::util Namespace Reference

Data Structures

- class **ByteArrayAdapter**

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

- class **HexStringParser**

5.32 decaf::io Namespace Reference

Data Structures

- class **BlockingByteArrayInputStream**
This is a blocking version of a byte buffer stream.
- class **BufferedInputStream**
*A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of **io** (p. 100) operations on the input stream.*
- class **BufferedOutputStream**
Wrapper around another output stream that buffers output before writing to the target output stream.
- class **ByteArrayInputStream**
*Simple implementation of **InputStream** (p. 1406) that wraps around an STL Vector `std::vector<unsigned char>`.*
- class **ByteArrayOutputStream**
- class **Closeable**
Interface for a class that implements the close method.
- class **DataInputStream**
A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.
- class **DataOutputStream**
A data output stream lets an application write primitive Java data types to an output stream in a portable way.
- class **EOFException**
- class **FilterInputStream**
*A **FilterInputStream** (p. 1315) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.*
- class **FilterOutputStream**
This class is the superclass of all classes that filter output streams.
- class **InputStream**
Base interface for an input stream.
- class **InterruptedIOException**
- class **IOException**
- class **OutputStream**
Base interface for an output stream.
- class **Reader**
- class **UTFDataFormatException**
Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

- class **Writer**

5.33 decaf::lang Namespace Reference

Namespaces

- namespace **exceptions**

Data Structures

- class **Appendable**
- class **Boolean**
- class **Byte**
- class **Character**
- class **CharSequence**

*A **CharSequence** (p. 833) is a readable sequence of char values.*

- class **Comparable**

This interface imposes a total ordering on the objects of each class that implements it.

- class **Double**
- class **Exception**
- class **Float**
- class **Integer**
- class **Iterable**

*Implementing this interface allows an object to be cast to an **Iterable** (p. 1487) type for generic collections API calls.*

- class **Long**
- class **Math**

*The class **Math** (p. 1718) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.*

- class **Number**

*The abstract class **Number** (p. 1954) is the superclass of classes **Byte** (p. 664), **Double** (p. 1231), **Float** (p. 1328), **Integer** (p. 1428), **Long** (p. 1652), and **Short** (p. 2321).*

- class **AtomicRefCounter**
- struct **STATIC_CAST_TOKEN**
- struct **DYNAMIC_CAST_TOKEN**
- class **Pointer**

*Decaf's implementation of a Smart **Pointer** (p. 2011) that is a template on a Type and is **Thread** (p. 2544) Safe if the default Reference Counter is used.*

- class **PointerComparator**

*This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2011) instance.*

- class **Runnable**

Interface for a runnable object - defines a task that can be run by a thread.

- class **Runtime**
- class **Short**
- class **System**
- class **Thread**

*Basic thread class - mimics the Java **Thread** (p. 2544).*

- class **Throwable**

This class represents an error that has occurred.

Functions

5.35 decaf::net Namespace Reference

Data Structures

- class **BindException**
- class **BufferedSocket**

*Buffered **Socket** (p. 2371) class that wraps a **Socket** (p. 2371) derived object and provides Buffered input and Output Streams to improve the efficiency of the reads and writes.*

- class **ConnectException**
- class **HttpRetryException**
- class **MalformedURLErrorException**
- class **NoRouteToHostException**
- class **PortUnreachableException**
- class **ProtocolException**
- class **ServerSocket**

A server socket class (for testing purposes).

- class **Socket**
- class **SocketError**

Static utility class to simplify handling of error codes for socket operations.

- class **SocketException**

Exception for errors when manipulating sockets.

- class **SocketFactory**

***Socket** (p. 2371) Factory implementation for use in Creating Sockets.*

- class **SocketInputStream**

Input stream for performing reads on a socket.

- class **SocketOutputStream**

Output stream for performing write operations on a socket.

- class **SocketTimeoutException**
- class **TcpSocket**

Platform-independent implementation of the socket interface.

- class **UnknownHostException**
- class **UnknownServiceException**
- class **URI**

*This class represents an instance of a **URI** (p. 2638) as defined by RFC 2396.*

- class **URISyntaxException**
- class **URL**

*Class **URL** (p. 2677) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.*

- class **URLDecoder**
- class **URLEncoder**

5.36 decaf::nio Namespace Reference

Data Structures

- class **Buffer**

A container for data of a specific primitive type.

- class **BufferOverflowException**
- class **BufferUnderflowException**
- class **ByteBuffer**

This class defines six categories of operations upon byte buffers:.

- class **CharBuffer**

This class defines four categories of operations upon character buffers:.

- class **DoubleBuffer**

This class defines four categories of operations upon double buffers:.

- class **FloatBuffer**

This class defines four categories of operations upon float buffers:.

- class **IntBuffer**

This class defines four categories of operations upon int buffers:.

- class **InvalidMarkException**

- class **LongBuffer**

This class defines four categories of operations upon long long buffers:.

- class **ReadOnlyBufferException**

- class **ShortBuffer**

This class defines four categories of operations upon short buffers:.

Data Structures

- class **GeneralSecurityException**
- class **InvalidKeyException**
- class **Key**

*The **Key** (p. 1570) interface is the top-level interface for all keys.*

- class **KeyException**
- class **NoSuchAlgorithmException**
- class **NoSuchProviderException**
- class **Principal**

Base interface for a principal, which can represent an individual or organization.

- class **PublicKey**

A public key.

- class **SignatureException**

5.38 decaf::security::auth Namespace Reference

Namespaces

- namespace **x500**

5.39 decaf::security::auth::x500 Namespace Reference

Data Structures

- class **X500Principal**

5.40 decaf::security::cert Namespace Reference

Data Structures

- class **Certificate**
Base interface for all identity certificates.
- class **CertificateEncodingException**
- class **CertificateException**
- class **CertificateExpiredException**
- class **CertificateNotYetValidException**
- class **CertificateParsingException**
- class **X509Certificate**
Base interface for all identity certificates.

5.41 decaf::security_provider Namespace Reference

Namespaces

- namespace **unix**

Data Structures

- class **SecurityProvider**
- class **SecurityProviderMap**

Lookup Map for Connector Factories.

- class **SecurityProviderRegistrar**

Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour).

5.42 decaf::security_provider::unix Namespace Reference

Namespaces

- namespace `openssl`

5.43 decaf::security_provider::unix::openssl Namespace Reference

Data Structures

- class **OpenSSLX500Principal**
The `OpenSSLX500Principal` (p. 1961) wraps around an `OpenSSL X509_NAME` structure.
- class **OpenSSLX509Certificate**

5.44 decaf::util Namespace Reference

Namespaces

- namespace **concurrent**
- namespace **logging**

Data Structures

- class **AbstractCollection**

*This class provides a skeletal implementation of the **Collection** (p. 871) interface, to minimize the effort required to implement this interface.*

- class **AbstractList**

*This class provides a skeletal implementation of the **List** (p. 1591) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array).*

- class **AbstractMap**

*This class provides a skeletal implementation of the **Map** (p. 1689) interface, to minimize the effort required to implement this interface.*

- class **AbstractQueue**

*This class provides skeletal implementations of some **Queue** (p. 2154) operations.*

- class **AbstractSequentialList**

*This class provides a skeletal implementation of the **List** (p. 1591) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list).*

- class **AbstractSet**

*This class provides a skeletal implementation of the **Set** (p. 2320) interface to minimize the effort required to implement this interface.*

- class **Collection**

The root interface in the collection hierarchy.

- class **Comparator**

A comparison function, which imposes a total ordering on some collection of objects.

- class **Date**

Wrapper class around a time value in milliseconds.

- class **Iterator**

Defines an object that can be used to iterate over the elements of a collection.

- class **List**

An ordered collection (also known as a sequence).

- class **ListIterator**

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

- class **Map**

***Map** (p. 1689) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.*

- class **Properties**

Java-like properties class for mapping string names to string values.

- class **Queue**

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

- class **Random**

***Random** (p. 2160) Value Generator which is used to generate a stream of pseudorandom numbers.*

- class **Set**

A collection that contains no duplicate elements.

- class **StlList**

***List** (p. 1591) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.*

- class **StlMap**

***Map** (p. 1689) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.*

- class **StlQueue**

*The **Queue** (p. 2154) class accepts messages with an `psuh(m)` command where `m` is the message to be queued.*

- class **StlSet**

***Set** (p. 2320) template that wraps around a `std::set` to provide a more user-friendly interface and to provide common functions that do not exist in `std::set`.*

- class **StringTokenizer**

- class **UUID**

*A class that represents an immutable universally unique identifier (**UUID** (p. 2686)).*

5.45 decaf::util::concurrent Namespace Reference

Namespaces

- namespace **atomic**
- namespace **locks**

Data Structures

- class **BrokenBarrierException**
- class **Callable**
- class **CancellationException**
- class **ConcurrentMap**

*Interface for a **Map** (p. 1689) type that provides additional **atomic** (p. 118) **putIfAbsent**, **remove**, and **replace** methods alongside the already available **Map** (p. 1689) interface.*

- class **ConcurrentStlMap**

***Map** (p. 1689) template that wraps around a **std::map** to provide a more user-friendly interface and to provide common functions that do not exist in **std::map**.*

- class **CountDownLatch**
- class **Delayed**

*A **mix-in** style interface for marking objects that should be acted upon after a given delay.*

- class **ExecutionException**
- class **Executor**

*An object that executes submitted **decaf.lang Runnable** (p. 2256) tasks.*

- class **Future**

*A **Future** (p. 1374) represents the result of an asynchronous computation.*

- class **Lock**

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

- class **Mutex**

*Creates a **pthread_mutex_t** object.*

- class **PooledThread**
- class **PooledThreadListener**

*Abstract Listener Interface for users of **ThreadPool** (p. 2549).*

- class **RejectedExecutionException**
- class **Synchronizable**

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

- class **TaskListener**
- class **ThreadFactory**

*public interface **ThreadFactory** (p. 2547)*

- class **ThreadPool**

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

- class **TimeoutException**
- class **TimeUnit**

*A **TimeUnit** (p. 2562) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.*

5.46 decaf::util::concurrent::atomic Namespace Reference

Data Structures

- class **AtomicBoolean**
A boolean value that may be updated atomically.
- class **AtomicInteger**
An int value that may be updated atomically.
- class **AtomicReference**
An Pointer reference that may be updated atomically.

5.47 decaf::util::concurrent::locks Namespace Reference

Data Structures

- class **Condition**

***Condition** (p. 932) factors out the **Mutex** (p. 1921) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1618) implementations.*

- class **Lock**

***Lock** (p. 1618) implementations provide more extensive locking operations than can be obtained using synchronized statements.*

- class **ReadWriteLock**

*A **ReadWriteLock** (p. 2170) maintains a pair of associated **locks** (p. 119), one for read-only operations and one for writing.*

5.48 decaf::util::logging Namespace Reference

Data Structures

- class **Filter**

A **Filter** (p. 1314) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.

- class **Formatter**

A **Formatter** (p. 1372) provides support for formatting *LogRecords*.

- class **Handler**

A **Handler** (p. 1382) object takes log messages from a **Logger** (p. 1623) and exports them.

- class **Logger**

- class **LoggerHierarchy**

- class **LogManager**

There is a single global **LogManager** (p. 1640) object that is used to maintain a set of shared state about *Loggers* and log services.

- class **LogRecord**

- class **LogWriter**

- class **MarkBlockLogger**

Defines a class that can be used to mark the entry and exit from scoped blocks.

- class **PropertiesChangeListener**

Defines the interface that classes can use to listen for change events on **Properties** (p. 2140).

- class **SimpleFormatter**

Print a brief summary of the **LogRecord** (p. 1645) in a human readable format.

- class **SimpleLogger**

- class **StreamHandler**

Enumerations

- enum **Level** {

Off, Null, Markblock, Debug,

Info, Warn, Error, Fatal,

Throwing }

Defines an enumeration for logging levels.

5.48.1 Enumeration Type Documentation

5.48.1.1 enum decaf::util::logging::Level

Defines an enumeration for **logging** (p. 120) levels.

Enumerator:

Off

Null

Markblock

Debug

Info

Warn

Error

Fatal

Throwing

5.49 std Namespace Reference

Data Structures

- struct `less< decaf::lang::Pointer< T > >`

An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.

Chapter 6

Data Structure Documentation

6.1 decaf::util::AbstractCollection< E > Class Template Reference

This class provides a skeletal implementation of the **Collection** (p. 871) interface, to minimize the effort required to implement this interface.

#include <src/main/decaf/util/AbstractCollection.h> Inheritance diagram for decaf::util::AbstractCollection< E >:

Public Member Functions

- virtual ~**AbstractCollection** ()
- **AbstractCollection**< E > & **operator=** (const **AbstractCollection**< E > &collection)
Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.
- virtual bool **add** (const E &value DECAF_UNUSED)
throw (lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)
Ensures that this collection contains the specified element (optional operation).
- virtual bool **addAll** (const **Collection**< E > &collection)
throw (lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)
Adds all of the elements in the specified collection to this collection (optional operation).
- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)
Removes all of the elements from this collection (optional operation).
- virtual void **copy** (const **Collection**< E > &collection)
*Renders this **Collection** (p. 871) as a Copy of the given **Collection** (p. 871).*

- virtual bool **contains** (const E &value) const throw (lang::Exception)
Returns true if this collection contains the specified element.
- virtual bool **containsAll** (const **Collection**< E > &collection) const throw (lang::Exception)
Returns true if this collection contains all of the elements in the specified collection.
- virtual bool **equals** (const **Collection**< E > &collection) const
*Answers true if this **Collection** (p. 871) and the one given are the same size and if each element contained in the **Collection** (p. 871) given is equal to an element contained in this collection.*
- virtual bool **isEmpty** () const
Returns true if this collection contains no elements.
- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes a single instance of the specified element from this collection, if it is present (optional operation).
- virtual bool **removeAll** (const **Collection**< E > &collection) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes all of this collection's elements that are also contained in the specified collection (optional operation).
- virtual bool **retainAll** (const **Collection**< E > &collection) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Retains only the elements in this collection that are contained in the specified collection (optional operation).
- virtual std::vector< E > **toArray** () const
*Answers an STL vector containing copies of all elements contained in this **Collection** (p. 871).*
- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

Protected Attributes

- `util::concurrent::Mutex mutex`

6.1.1 Detailed Description

`template<typename E> class decaf::util::AbstractCollection< E >`

This class provides a skeletal implementation of the **Collection** (p. 871) interface, to minimize the effort required to implement this interface. To implement an unmodifiable collection, the programmer needs only to extend this class and provide implementations for the iterator and size methods. (The iterator returned by the iterator method must implement `hasNext` and `next`.)

To implement a modifiable collection, the programmer must additionally override this class's `add` method (which otherwise throws an `UnsupportedOperationException`), and the iterator returned by the iterator method must additionally implement its `remove` method.

The programmer should generally provide a void (no argument) and **Collection** (p. 871) constructor, as per the recommendation in the **Collection** (p. 871) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

Since:

1.0

6.1.2 Constructor & Destructor Documentation

6.1.2.1 `template<typename E> virtual decaf::util::AbstractCollection< E >::~~AbstractCollection () [inline, virtual]`

6.1.3 Member Function Documentation

6.1.3.1 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::add (const E &value DECAF_UNUSED) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]`

Ensures that this collection contains the specified element (optional operation). Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. **Collection** (p. 871) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

This implementation always throws an `UnsupportedOperationException`.

Parameters:

value - The element that must be ensured to be in this collection.

Returns:

true if the collection was changed as a result of this call.

Exceptions:

UnsupportedOperationException if the add operation is not supported by this collection

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Referenced by `decaf::util::AbstractCollection< Pointer< BackupTransport > >::addAll()`, `decaf::util::AbstractCollection< Pointer< BackupTransport > >::copy()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::operator=()`.

```
6.1.3.2  template<typename E> virtual bool decaf::util::AbstractCollection<
        E >::addAll (const Collection< E > & collection) throw
        ( lang::exceptions::UnsupportedOperationException,
          lang::exceptions::IllegalArgumentException,
          lang::exceptions::IllegalStateException ) [inline,
          virtual]
```

Adds all of the elements in the specified collection to this collection (optional operation). The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an `UnsupportedOperationException` unless `add` is overridden (assuming the specified collection is non-empty).

Parameters:

collection - The **Collection** (p. 871) whose elements are to be added to this **Collection** (p. 871).

Returns:

true if the collection was changed as a result of this call.

Exceptions:

UnsupportedOperationException if the `addAll` operation is not supported by this collection

IllegalArgumentException if some property of the element prevents it from being added to this collection

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Reimplemented in `decaf::util::AbstractQueue< E >` (p. 137).

6.1.3.3 `template<typename E> virtual void decaf::util::AbstractCollection< E >::clear () throw (lang::exceptions::UnsupportedOperationException)`
`[inline, virtual]`

Removes all of the elements from this collection (optional operation). The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p.1490) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Implements `decaf::util::Collection< E >` (p. 874).

Reimplemented in `decaf::util::AbstractQueue< E >` (p.138), `decaf::util::StlList< E >` (p. 2423), `decaf::util::StlSet< E >` (p. 2449), `decaf::util::StlList< CompositeTask * >` (p. 2423), `decaf::util::StlList< URI >` (p. 2423), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2423), `decaf::util::StlList< PrimitiveValueNode >` (p. 2423), `decaf::util::StlList< Pointer< Command > >` (p. 2423), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2423), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2449), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2449).

Referenced by `decaf::util::AbstractCollection< Pointer< BackupTransport > >::copy()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::operator=()`.

6.1.3.4 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::contains (const E & value) const throw (lang::Exception)`
`[inline, virtual]`

Returns true if this collection contains the specified element. This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value - the value whose presence is to be queried for in this **Collection** (p. 871).

Returns:

true if the value is contained in this collection

Exceptions:

Exception if an error occurs,

Implements `decaf::util::Collection< E >` (p. 875).

Reimplemented in `decaf::util::StlList< E >` (p. 2423), `decaf::util::StlSet< E >` (p. 2450), `decaf::util::StlList< CompositeTask * >` (p. 2423), `decaf::util::StlList< URI >` (p. 2423), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2423), `decaf::util::StlList< PrimitiveValueNode >` (p. 2423), `decaf::util::StlList< Pointer< Command > >` (p. 2423),

`decaf::util::StlList< Pointer< BackupTransport > >` (p. 2423), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2450), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2450).

Referenced by `decaf::util::AbstractCollection< Pointer< BackupTransport > >::containsAll()`.

6.1.3.5 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::containsAll (const Collection< E > & collection) const throw (lang::Exception)` [inline, virtual]

Returns true if this collection contains all of the elements in the specified collection. This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Parameters:

collection collection to be checked for containment in this collection

Returns:

true if this collection contains all of the elements in the specified collection.

Exceptions:

Exception if an error occurs,

Referenced by `decaf::util::AbstractCollection< Pointer< BackupTransport > >::equals()`.

6.1.3.6 `template<typename E> virtual void decaf::util::AbstractCollection< E >::copy (const Collection< E > & collection)` [inline, virtual]

Renders this **Collection** (p. 871) as a Copy of the given **Collection** (p. 871). This implementation iterates over the contents of the given collection adding each to this collection after first calling this Collection's clear method.

Parameters:

collection - the collection to mirror.

6.1.3.7 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::equals (const Collection< E > & collection) const` [inline, virtual]

Answers true if this **Collection** (p. 871) and the one given are the same size and if each element contained in the **Collection** (p. 871) given is equal to an element contained in this collection.

Parameters:

collection - The **Collection** (p. 871) to be compared to this one.

Returns:

true if this **Collection** (p. 871) is equal to the one given.

6.1.3.8 `template<typename E> virtual bool decaf::util::AbstractCollection< E >::isEmpty () const [inline, virtual]`

Returns true if this collection contains no elements. This implementation returns `size()` (p. 878) == 0.

Returns:

true if the size method return 0.

Implements `decaf::util::Collection< E >` (p. 876).

Reimplemented in `decaf::util::StlList< E >` (p. 2425), `decaf::util::StlSet< E >` (p. 2450), `decaf::util::StlList< CompositeTask * >` (p. 2425), `decaf::util::StlList< URI >` (p. 2425), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2425), `decaf::util::StlList< PrimitiveValueNode >` (p. 2425), `decaf::util::StlList< Pointer< Command > >` (p. 2425), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2425), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2450), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2450).

6.1.3.9 `template<typename E> virtual void decaf::util::AbstractCollection< E >::lock () throw (lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2508).

6.1.3.10 `template<typename E> virtual void decaf::util::AbstractCollection< E >::notify () throw (lang::Exception) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2510).

6.1.3.11 `template<typename E> virtual void decaf::util::AbstractCollection< E >::notifyAll () throw (lang::Exception) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2511).

6.1.3.12 `template<typename E> AbstractCollection<E>&
decaf::util::AbstractCollection< E >::operator= (const
AbstractCollection< E > & collection) [inline]`

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

Parameters:

collection - the collection to copy

Returns:

a reference to this collection

6.1.3.13 `template<typename E> virtual bool decaf::util::AbstractCollection<
E >::remove (const E & value) throw (
lang::exceptions::UnsupportedOperationException,
lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation). More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 871).

Implements `decaf::util::Collection< E >` (p. 876).

Reimplemented in `decaf::util::StlList< E >` (p. 2427), `decaf::util::StlSet< E >` (p. 2451), `decaf::util::StlList< CompositeTask * >` (p. 2427), `decaf::util::StlList< URI >` (p. 2427), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2427), `decaf::util::StlList< PrimitiveValueNode >` (p. 2427), `decaf::util::StlList< Pointer< Command > >` (p. 2427), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2427), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2451), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2451).

```

6.1.3.14  template<typename E> virtual bool decaf::util::AbstractCollection<
            E >::removeAll (const Collection< E > & collection)
            throw ( lang::exceptions::UnsupportedOperationException,
                    lang::exceptions::IllegalArgumentException ) [inline, virtual]

```

Removes all of this collection's elements that are also contained in the specified collection (optional operation). After this call returns, this collection will contain no elements in common with the specified collection.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

Parameters:

collection - collection containing elements to be removed from this collection

Returns:

true if this collection changed as a result of the call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection

IllegalArgumentException.

Reimplemented in `decaf::util::AbstractSet< E >` (p. 141), `decaf::util::AbstractSet< Pointer< Synchronization > >` (p. 141), and `decaf::util::AbstractSet< ActiveMQSession * >` (p. 141).

```

6.1.3.15  template<typename E> virtual bool decaf::util::AbstractCollection<
            E >::retainAll (const Collection< E > & collection)
            throw ( lang::exceptions::UnsupportedOperationException,
                    lang::exceptions::IllegalArgumentException ) [inline, virtual]

```

Retains only the elements in this collection that are contained in the specified collection (optional operation). In other words, removes from this collection all of its elements that are not contained in the specified collection.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

Parameters:

collection - collection containing elements to be retained in this collection

Returns:

true if this collection changed as a result of the call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection

IllegalArgumentException.

6.1.3.16 `template<typename E> virtual std::vector<E>
decaf::util::AbstractCollection< E >::toArray () const [inline, virtual]`

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 871). All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns:

an vector of copies of all the elements from this **Collection** (p. 871)

Implements `decaf::util::Collection< E >` (p. 878).

6.1.3.17 `template<typename E> virtual void decaf::util::AbstractCollection< E
>::unlock () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2512).

6.1.3.18 `template<typename E> virtual void decaf::util::AbstractCollection< E
>::wait (unsigned long milliseconds) throw (lang::Exception) [inline,
virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2513).

6.1.3.19 `template<typename E> virtual void decaf::util::AbstractCollection< E >::wait () throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2514).

6.1.4 Field Documentation

6.1.4.1 `template<typename E> util::concurrent::Mutex decaf::util::AbstractCollection< E >::mutex [mutable, protected]`

Referenced by `decaf::util::AbstractCollection< Pointer< BackupTransport > >::lock()`, `decaf::util::AbstractCollection< Pointer< BackupTransport > >::notify()`, `decaf::util::AbstractCollection< Pointer< BackupTransport > >::notifyAll()`, `decaf::util::AbstractCollection< Pointer< BackupTransport > >::unlock()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::wait()`.

6.2.1 Detailed Description

```
template<typename E> class decaf::util::AbstractList< E >
```

This class provides a skeletal implementation of the **List** (p. 1591) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array). For sequential access data (such as a linked list), **AbstractSequentialList** (p. 140) should be used in preference to this class.

To implement an unmodifiable list, the programmer needs only to extend this class and provide implementations for the `get(int)` and `size()` (p. 878) methods.

To implement a modifiable list, the programmer must additionally override the `set(int, E)` method (which otherwise throws an `UnsupportedOperationException`). If the list is variable-size the programmer must additionally override the `add(int, E)` and `remove(int)` methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 871) interface specification.

Unlike the other abstract collection implementations, the programmer does not have to provide an iterator implementation; the iterator and list iterator are implemented by this class, on top of the "random access" methods: `get(int)`, `set(int, E)`, `add(int, E)` and `remove(int)`.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

6.3 decaf::util::AbstractMap< K, V, COMPARATOR > Class Template Reference

This class provides a skeletal implementation of the **Map** (p.1689) interface, to minimize the effort required to implement this interface.

#include <src/main/decaf/util/AbstractMap.h> Inheritance diagram for decaf::util::AbstractMap< K, V, COMPARATOR >:

Public Member Functions

- virtual ~AbstractMap ()

6.3.1 Detailed Description

template<typename K, typename V, typename COMPARATOR> class decaf::util::AbstractMap< K, V, COMPARATOR >

This class provides a skeletal implementation of the **Map** (p.1689) interface, to minimize the effort required to implement this interface. To implement an unmodifiable map, the programmer needs only to extend this class and provide an implementation for the entrySet method, which returns a set-view of the map's mappings. Typically, the returned set will, in turn, be implemented atop **AbstractSet** (p.141). This set should not support the add or remove methods, and its iterator should not support the remove method.

To implement a modifiable map, the programmer must additionally override this class's put method (which otherwise throws an UnsupportedOperationException), and the iterator returned by entrySet().iterator() must additionally implement its remove method.

The programmer should generally provide a void (no argument) and map constructor, as per the recommendation in the **Map** (p.1689) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the map being implemented admits a more efficient implementation.

6.4 decaf::util::AbstractQueue< E > Class Template Reference

This class provides skeletal implementations of some **Queue** (p.2154) operations.

```
#include <src/main/decaf/util/AbstractQueue.h> Inheritance diagram for
decaf::util::AbstractQueue< E >:
```

Public Member Functions

- **AbstractQueue** ()
- virtual ~**AbstractQueue** ()
- virtual bool **add** (const E &value) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)

Inserts the specified element into this queue if it is possible to do so immediately without violating capacity restrictions, returning true upon success and throwing an IllegalStateException if no space is currently available.

- virtual bool **addAll** (const **Collection**< E > &collection) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

Adds all the elements of a collection to the queue.

- virtual E **remove** () throw (decaf::lang::exceptions::NoSuchElementException)

Retrieves and removes the head of this queue.

- virtual const E & **element** () const throw (decaf::lang::exceptions::NoSuchElementException)

Retrieves, but does not remove, the head of this queue.

- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)

Removes all elements of the queue.

6.4.1 Detailed Description

```
template<typename E> class decaf::util::AbstractQueue< E >
```

This class provides skeletal implementations of some **Queue** (p.2154) operations. Methods add, remove, and element are based on offer, poll, and peek, respectively but throw exceptions instead of indicating failure via false or null returns.

A **Queue** (p. 2154) implementation that extends this class must minimally define a method **Queue** (p.2154). **offer(E)** which does not permit insertion of null elements, along with methods **Queue** (p.2154). **peek()** (p.2156), **Queue.poll()** (p.2156), **Collection.size()** (p.878), and a **Collection.iterator()** (p.1487) supporting **Iterator.remove()** (p.1490). Typically, additional methods will be overridden as well. If these requirements cannot be met, consider instead subclassing **AbstractCollection** (p.123).

1.0

6.4.2 Constructor & Destructor Documentation

6.4.2.1 `template<typename E > decaf::util::AbstractQueue< E >::AbstractQueue()` [inline]

6.4.2.2 `template<typename E > virtual decaf::util::AbstractQueue< E >::~~AbstractQueue()` [inline, virtual]

6.4.3 Member Function Documentation

6.4.3.1 `template<typename E > virtual bool decaf::util::AbstractQueue< E >::add (const E & value) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)` [inline, virtual]

Inserts the specified element into this queue if it is possible to do so immediately without violating capacity restrictions, returning true upon success and throwing an `IllegalStateException` if no space is currently available. This implementation returns true if offer succeeds, else throws an `IllegalStateException`.

Parameters:

value - the element to offer to the **Queue** (p. 2154).

Returns:

true if the add succeeds.

Exceptions:

IllegalArgumentException if the element cannot be added.

Implements `decaf::util::Collection< E >` (p. 873).

References `decaf::util::Queue< E >::offer()`.

6.4.3.2 `template<typename E > virtual bool decaf::util::AbstractQueue< E >::addAll (const Collection< E > & collection) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)` [inline, virtual]

Adds all the elements of a collection to the queue. If the collection is the queue itself, then an `IllegalArgumentException` will be thrown out. If during the process, some runtime exception is thrown out, then part of the elements in the collection that have successfully added will remain in the queue.

The result of the method is undefined if the collection is modified during the process of the method.

Parameters:

collection - the collection to be added to the queue.

Returns:

true if the operation succeeds.

Exceptions:

IllegalArgumentException If the collection to be added to the queue is the queue itself.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 126).

6.4.3.3 `template<typename E > virtual void decaf::util::AbstractQueue< E >::clear
() throw (lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all elements of the queue. This implementation repeatedly invokes poll until it returns the empty marker.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 127).

References **decaf::util::Queue< E >::getEmptyMarker()**, and **decaf::util::Queue< E >::poll()**.

6.4.3.4 `template<typename E > virtual const E&
decaf::util::AbstractQueue< E >::element () const throw (
decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Retrieves, but does not remove, the head of this queue. This method differs from peek only in that it throws an exception if this queue is empty.

This implementation returns the result of peek unless the queue is empty.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException if the queue is empty.

Implements **decaf::util::Queue< E >** (p. 2155).

References **decaf::util::Queue< E >::getEmptyMarker()**, and **decaf::util::Queue< E >::peek()**.

6.4.3.5 `template<typename E > virtual E decaf::util::AbstractQueue< E >::remove
() throw (decaf::lang::exceptions::NoSuchElementException) [inline,
virtual]`

Retrieves and removes the head of this queue. This method differs from poll only in that it throws an exception if this queue is empty.

This implementation returns the result of poll unless the queue is empty.

Returns:

a copy of the element in the head of the queue.

Exceptions:

NoSuchElementException if the queue is empty.

Implements **decaf::util::Queue< E >** (p. 2156).

References **decaf::util::Queue< E >::getEmptyMarker()**, and **decaf::util::Queue< E >::poll()**.

The documentation for this class was generated from the following file:

6.5 decaf::util::AbstractSequentialList< E > Class Template Reference

This class provides a skeletal implementation of the **List** (p.1591) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list).

#include <src/main/decaf/util/AbstractSequentialList.h> Inheritance diagram for decaf::util::AbstractSequentialList< E >:

Public Member Functions

- virtual ~AbstractSequentialList ()

6.5.1 Detailed Description

template<typename E> class decaf::util::AbstractSequentialList< E >

This class provides a skeletal implementation of the **List** (p.1591) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list). For random access data (such as an array), **AbstractList** (p.134) should be used in preference to this class.

This class is the opposite of the **AbstractList** (p.134) class in the sense that it implements the "random access" methods (get(int index), set(int index, E element), add(int index, E element) and remove(int index)) on top of the list's list iterator, instead of the other way around.

To implement a list the programmer needs only to extend this class and provide implementations for the listIterator and size methods. For an unmodifiable list, the programmer need only implement the list iterator's hasNext, next, hasPrevious, previous and index methods.

For a modifiable list the programmer should additionally implement the list iterator's set method. For a variable-size list the programmer should additionally implement the list iterator's remove and add methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p.871) interface specification.

Since:

1.0

6.5.2 Constructor & Destructor Documentation

6.6 decaf::util::AbstractSet< E > Class Template Reference

This class provides a skeletal implementation of the **Set** (p. 2320) interface to minimize the effort required to implement this interface.

```
#include <src/main/decaf/util/AbstractSet.h> Inheritance      diagram      for
decaf::util::AbstractSet< E >:
```

Public Member Functions

- virtual **~AbstractSet** ()
- virtual bool **removeAll** (const **Collection**< E > &collection) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes from this set all of its elements that are contained in the specified collection (optional operation).

6.6.1 Detailed Description

```
template<typename E> class decaf::util::AbstractSet< E >
```

This class provides a skeletal implementation of the **Set** (p. 2320) interface to minimize the effort required to implement this interface. The process of implementing a set by extending this class is identical to that of implementing a **Collection** (p. 871) by extending **AbstractCollection** (p. 123), except that all of the methods and constructors in subclasses of this class must obey the additional constraints imposed by the **Set** (p. 2320) interface (for instance, the add method must not permit addition of multiple instances of an object to a set).

Since:

1.0

6.6.2 Constructor & Destructor Documentation

6.6.2.1 template<typename E> virtual decaf::util::AbstractSet< E >::~AbstractSet () [inline, virtual]

6.6.3 Member Function Documentation

6.6.3.1 template<typename E> virtual bool decaf::util::AbstractSet< E >::removeAll (const **Collection**< E > & collection) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]

Removes from this set all of its elements that are contained in the specified collection (optional operation). If the specified collection is also a set, this operation effectively modifies this set so that its value is the asymmetric set difference of the two sets.

This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates

over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by the iterator method does not implement the remove method.

Parameters:

collection - The **Collection** (p. 871) whose elements are to be retained

Returns:

true if the collection changed as a result of this call

Exceptions:

UnsupportedOperationException

IllegalArgumentException

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 131).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/AbstractSet.h`

6.7 activemq::transport::AbstractTransportFactory Class Reference

Abstract implementation of the **TransportFactory** (p. 2614) interface, providing the base functionality that's common to most of the **TransportFactory** (p. 2614) instances.

#include <src/main/activemq/transport/AbstractTransportFactory.h> Inheritance diagram for activemq::transport::AbstractTransportFactory:

Public Member Functions

Protected Member Functions

- virtual **Pointer< wireformat::WireFormat > createWireFormat** (const **decaf::util::Properties** &properties) throw (**decaf::lang::exceptions::NoSuchElementException**)

*Creates the WireFormat that is configured for this **Transport** (p. 2608) and returns it.*

6.7.1 Detailed Description

Abstract implementation of the **TransportFactory** (p. 2614) interface, providing the base functionality that's common to most of the **TransportFactory** (p. 2614) instances.

Since:

3.0

6.7.2 Constructor & Destructor Documentation

- 6.7.2.1** virtual **activemq::transport::AbstractTransportFactory::~AbstractTransportFactory** () [inline, virtual]

6.7.3 Member Function Documentation

- 6.7.3.1** virtual **Pointer<wireformat::WireFormat> activemq::transport::AbstractTransportFactory::createWireFormat** (const **decaf::util::Properties** & *properties*) throw (**decaf::lang::exceptions::NoSuchElementException**) [protected, virtual]

Creates the WireFormat that is configured for this **Transport** (p.2608) and returns it. The default WireFormat is Openwire.

Parameters:

properties The properties that were configured on the URI.

Returns:

a pointer to a `WireFormat` instance that the caller then owns.

Exceptions:

NoSuchElementException if the configured `WireFormat` is not found.

The documentation for this class was generated from the following file:

6.8 activemq::core::ActiveMQAckHandler Class Reference

Interface class that is used to give CMS Messages an interface to Ack themselves with.

#include <src/main/activemq/core/ActiveMQAckHandler.h> Inheritance diagram for activemq::core::ActiveMQAckHandler:

Public Member Functions

- virtual **~ActiveMQAckHandler** ()
- virtual void **acknowledgeMessage** (const **commands::Message** *message)=0 throw (cms::CMSException)

Method called to acknowledge the message passed.

6.8.1 Detailed Description

Interface class that is used to give CMS Messages an interface to Ack themselves with.

Since:

2.0

6.8.2 Constructor & Destructor Documentation

- 6.8.2.1** virtual **activemq::core::ActiveMQAckHandler::~ActiveMQAckHandler** ()
[inline, virtual]

6.8.3 Member Function Documentation

- 6.8.3.1** virtual void **activemq::core::ActiveMQAckHandler::acknowledgeMessage** (const **commands::Message** * *message*) throw (cms::CMSException)
[pure virtual]

Method called to acknowledge the message passed.

Parameters:

message Message to Acknowledge

Exceptions:

CMSException

Implemented in **activemq::core::ActiveMQConsumer** (p. 221).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQAckHandler.h**

6.9 activemq::commands::ActiveMQBlobMessage Class Reference

Public Member Functions

- **ActiveMQBlobMessage** ()
- virtual **~ActiveMQBlobMessage** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ActiveMQBlobMessage * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- std::string **getRemoteBlobUrl** () const
Get the Remote URL of the Blob.
- void **setRemoteBlobUrl** (const std::string &remoteURL)
Set the Remote URL of the Blob.
- std::string **getMimeType** () const
Get the Mime Type of the Blob.
- void **setMimeType** (const std::string &mimeType)
Set the Mime Type of the Blob.
- std::string **getName** () const
Gets the Name of the Blob.
- void **setName** (const std::string &name)
Sets the Name of the Blob.

- bool **isDeletedByBroker** () const
Gets if this Blob is deleted by the Broker.
- void **setDeletedByBroker** (bool value)
Sets the Deleted By Broker flag.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQBLOBMESSAGE** = 29
- static const std::string **BINARY_MIME_TYPE**

6.9.1 Constructor & Destructor Documentation

6.9.1.1 `activemq::commands::ActiveMQBlobMessage::ActiveMQBlobMessage ()`

6.9.1.2 `virtual
activemq::commands::ActiveMQBlobMessage::~ActiveMQBlobMessage ()
[inline, virtual]`

6.9.2 Member Function Documentation

6.9.2.1 `virtual cms::Message* activemq::commands::ActiveMQBlobMessage::clone
() const [inline, virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p.1758).

6.9.2.2 `virtual ActiveMQBlobMessage* ac-
tivemq::commands::ActiveMQBlobMessage::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p.1741).

6.9.2.3 `virtual void ac-
tivemq::commands::ActiveMQBlobMessage::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::Message` (p. 1742).

6.9.2.4 `virtual bool activemq::commands::ActiveMQBlobMessage::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Message` (p. 1742).

6.9.2.5 `virtual unsigned char activemq::commands::ActiveMQBlobMessage::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from `activemq::commands::Message` (p. 1743).

6.9.2.6 `std::string activemq::commands::ActiveMQBlobMessage::getMimeType () const` [inline]

Get the Mime Type of the Blob.

Returns:

string holding the MIME Type.

6.9.2.7 `std::string activemq::commands::ActiveMQBlobMessage::getName () const` [inline]

Gets the Name of the Blob.

Returns:

string name of the Blob.

6.9.2.8 `std::string activemq::commands::ActiveMQBlobMessage::getRemoteBlobUrl () const` [inline]

Get the Remote URL of the Blob.

Returns:

string from of the Remote Blob URL.

**6.9.2.9 bool activemq::commands::ActiveMQBlobMessage::isDeletedByBroker ()
const [inline]**

Gets if this Blob is deleted by the Broker.

Returns:

true if the Blob is deleted by the Broker.

**6.9.2.10 void activemq::commands::ActiveMQBlobMessage::setDeletedByBroker
(bool *value*) [inline]**

Sets the Deleted By Broker flag.

Parameters:

value - set the Delete by broker flag to value.

**6.9.2.11 void activemq::commands::ActiveMQBlobMessage::setMimeType (const
std::string & *mimeType*) [inline]**

Set the Mime Type of the Blob.

Parameters:

mimeType - String holding the MIME Type.

**6.9.2.12 void activemq::commands::ActiveMQBlobMessage::setName (const
std::string & *name*) [inline]**

Sets the Name of the Blob.

Parameters:

name - Name of the Blob.

**6.9.2.13 void activemq::commands::ActiveMQBlobMessage::setRemoteBlobUrl
(const std::string & *remoteURL*) [inline]**

Set the Remote URL of the Blob.

Parameters:

remoteURL - String form of the Remote URL.

6.9.2.14 `virtual std::string activemq::commands::ActiveMQBlobMessage::toString
() const [virtual]`

Returns a string containing the information for this **DataSet** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::Message` (p.1749).

6.9.3 Field Documentation

6.9.3.1 `const std::string activemq::commands::ActiveMQBlobMessage::BINARY_-
MIME_TYPE [static]`

6.9.3.2 `const unsigned char activemq::commands::ActiveMQBlobMessage::ID_-
ACTIVEMQBLOBMESSAGE = 29 [static]`

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.10.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p.151).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.10.2 Constructor & Destructor Documentation

6.10.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::ActiveMQBlobMessageMarshaller()` [inline]

6.10.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::~~ActiveMQBlobMessageMarshaller()` [inline, virtual]

6.10.3 Member Function Documentation

6.10.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::createObject(const commands::DataStructure&) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.10.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.10.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::marshal(const OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.10.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.10.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1868).

6.10.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

6.10.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

6.11.3 Member Function Documentation

6.11.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller::createObject(const commands::DataStructure&) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.11.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.11.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller::looseMarshal(const commands::DataStructure&, const OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.11.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.11.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1873).

6.11.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.11.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.12.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 159).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.12.2 Constructor & Destructor Documentation

6.12.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::ActiveMQBlobMessageMarshaller()` [inline]

6.12.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::~~ActiveMQBlobMessageMarshaller()` [inline, virtual]

6.12.3 Member Function Documentation

6.12.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::createObject(const commands::DataStructure& dataStructure) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.12.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.12.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::looseMarshal(const OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.12.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.12.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1863).

6.12.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

6.12.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ActiveMQBlobMessageMarshaller.h`

6.13 activemq::commands::ActiveMQBytesMessage Class Reference

#include <src/main/activemq/commands/ActiveMQBytesMessage.h> Inheritance diagram for activemq::commands::ActiveMQBytesMessage:

Public Member Functions

- **ActiveMQBytesMessage** ()
- virtual **~ActiveMQBytesMessage** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ActiveMQBytesMessage** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual **cms::BytesMessage** * **clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual void **clearBody** () throw (cms::CMSEException)
Clears out the body of the message.
- virtual void **setBodyBytes** (const unsigned char *buffer, std::size_t numBytes) throw (cms::CMSEException)
sets the bytes given to the message body.
- virtual const unsigned char * **getBodyBytes** () const throw (cms::CMSEException)
Gets the bytes that are contained in this message, user should copy this data into a user allocated buffer.
- virtual std::size_t **getBodyLength** () const throw (cms::CMSEException)
Returns the number of bytes contained in the body of this message.
- virtual void **reset** () throw (cms::CMSEException)
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () const throw (cms::CMSEException)

Reads a Boolean from the Bytes message stream.

- virtual void **writeBoolean** (bool value) throw (cms::CMSEException)
Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () const throw (cms::CMSEException)
Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value) throw (cms::CMSEException)
Writes a byte to the bytes message stream as a 1-byte value.
- virtual std::size_t **readBytes** (std::vector< unsigned char > &value) const throw (cms::CMSEException)
Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value) throw (cms::CMSEException)
Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual std::size_t **readBytes** (unsigned char *&buffer, std::size_t length) const throw (cms::CMSEException)
Reads a portion of the bytes message stream.
- virtual void **writeBytes** (const unsigned char *value, std::size_t offset, std::size_t length) throw (cms::CMSEException)
Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () const throw (cms::CMSEException)
Reads a Char from the Bytes message stream.
- virtual void **writeChar** (char value) throw (cms::CMSEException)
Writes a char to the bytes message stream as a 1-byte value.
- virtual float **readFloat** () const throw (cms::CMSEException)
Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value) throw (cms::CMSEException)
Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () const throw (cms::CMSEException)
Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value) throw (cms::CMSEException)
Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () const throw (cms::CMSEException)
Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value) throw (cms::CMSEException)

Writes a signed short to the bytes message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const throw (cms::CMSEException)
Reads a 16 bit unsigned short from the Bytes message stream.
- virtual void **writeUnsignedShort** (unsigned short value) throw (cms::CMSEException)
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () const throw (cms::CMSEException)
Reads a 32 bit signed intger from the Bytes message stream.
- virtual void **writeInt** (int value) throw (cms::CMSEException)
Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () const throw (cms::CMSEException)
Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value) throw (cms::CMSEException)
Writes a long long to the bytes message stream as a 8 byte value.
- virtual std::string **readString** () const throw (cms::CMSEException)
Reads an ASCII String from the Bytes message stream.
- virtual void **writeString** (const std::string &value) throw (cms::CMSEException)
Writes an ASCII String to the Bytes message stream.
- virtual std::string **readUTF** () const throw (cms::CMSEException)
Reads an UTF String from the BytesMessage stream.
- virtual void **writeUTF** (const std::string &value) throw (cms::CMSEException)
Writes an UTF String to the BytesMessage stream.

Static Public Attributes

- static const unsigned char **ID _ACTIVEMQBYTESMESSAGE** = 24

Protected Member Functions

- void **checkWriteOnlyBody** () const throw (cms::CMSEException)
Throws an exception if in write-only mode.

6.13.1 Constructor & Destructor Documentation

6.13.1.1 `activemq::commands::ActiveMQBytesMessage::ActiveMQBytesMessage ()`

6.13.1.2 `virtual
activemq::commands::ActiveMQBytesMessage::~~ActiveMQBytesMessage
() [inline, virtual]`

6.13.2 Member Function Documentation

6.13.2.1 `void activemq::commands::ActiveMQBytesMessage::checkWriteOnlyBody
() const throw (cms::CMSException) [protected]`

Throws an exception if in write-only mode.

Exceptions:

CMSException.

6.13.2.2 `virtual void activemq::commands::ActiveMQBytesMessage::clearBody ()
throw (cms::CMSException) [inline, virtual]`

Clears out the body of the message. This does not clear the headers or properties.

Reimplemented from `activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >` (p. 297).

6.13.2.3 `virtual cms::BytesMessage* ac-
tivemq::commands::ActiveMQBytesMessage::clone () const
[inline, virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements `cms::BytesMessage` (p. 762).

6.13.2.4 `virtual ActiveMQBytesMessage* ac-
tivemq::commands::ActiveMQBytesMessage::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::Message` (p. 1741).

6.13.2.5 `virtual void activemq::commands::ActiveMQBytesMessage::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::Message` (p. 1742).

6.13.2.6 `virtual bool activemq::commands::ActiveMQBytesMessage::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Parameters:

value The **Command** (p. 879) to compare to this one.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Message` (p. 1742).

6.13.2.7 `virtual const unsigned char* activemq::commands::ActiveMQBytesMessage::getBodyBytes () const throw (cms::CMSEException) [virtual]`

Gets the bytes that are contained in this message, user should copy this data into a user allocated buffer. Call `getBodyLength` to determine the number of bytes to expect.

Returns:

const pointer to a byte buffer

Implements `cms::BytesMessage` (p. 762).

6.13.2.8 `virtual std::size_t activemq::commands::ActiveMQBytesMessage::getBodyLength () const throw (cms::CMSEException) [virtual]`

Returns the number of bytes contained in the body of this message.

Returns:

number of bytes.

Implements `cms::BytesMessage` (p. 762).

6.13.2.9 `virtual unsigned char activemq::commands::ActiveMQBytesMessage::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from **activemq::commands::Message** (p. 1743).

6.13.2.10 `virtual bool activemq::commands::ActiveMQBytesMessage::readBoolean () const throw (cms::CMSEException) [virtual]`

Reads a Boolean from the Bytes message stream.

Returns:

boolean value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 763).

6.13.2.11 `virtual unsigned char activemq::commands::ActiveMQBytesMessage::readByte () const throw (cms::CMSEException) [virtual]`

Reads a Byte from the Bytes message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 763).

6.13.2.12 `virtual std::size_t activemq::commands::ActiveMQBytesMessage::readBytes (unsigned char *& buffer, std::size_t length) const throw (cms::CMSEException) [virtual]`

Reads a portion of the bytes message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than

the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an `IndexOutOfBoundsException` is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer - the buffer into which the data is read

length - the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSEException

Implements `cms::BytesMessage` (p. 763).

6.13.2.13 `virtual std::size_t activemq::commands::ActiveMQBytesMessage::readBytes (std::vector< unsigned char > & value) const throw (cms::CMSEException) [virtual]`

Reads a byte array from the bytes message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value - buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSEException if an error occurs.

Implements `cms::BytesMessage` (p. 764).

6.13.2.14 `virtual char activemq::commands::ActiveMQBytesMessage::readChar () const throw (cms::CMSEException) [virtual]`

Reads a Char from the Bytes message stream.

Returns:

char value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 764).

6.13.2.15 virtual double activemq::commands::ActiveMQBytesMessage::readDouble
() const throw (cms::CMSEException) [virtual]

Reads a 64 bit double from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 765).

6.13.2.16 virtual float activemq::commands::ActiveMQBytesMessage::readFloat ()
const throw (cms::CMSEException) [virtual]

Reads a 32 bit float from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 765).

6.13.2.17 virtual int activemq::commands::ActiveMQBytesMessage::readInt ()
const throw (cms::CMSEException) [virtual]

Reads a 32 bit signed integer from the Bytes message stream.

Returns:

int value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 765).

6.13.2.18 virtual long long activemq::commands::ActiveMQBytesMessage::readLong ()
const throw (cms::CMSEException) [virtual]

Reads a 64 bit long from the Bytes message stream.

Returns:

long long value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 766).

6.13.2.19 virtual short activemq::commands::ActiveMQBytesMessage::readShort ()
const throw (cms::CMSEException) [virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns:

short value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 766).

6.13.2.20 virtual std::string activemq::commands::ActiveMQBytesMessage::readString ()
const throw (cms::CMSEException) [virtual]

Reads an ASCII String from the Bytes message stream.

Returns:

String from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 766).

6.13.2.21 virtual unsigned short activemq::commands::ActiveMQBytesMessage::readUnsignedShort () const
throw (cms::CMSEException) [virtual]

Reads a 16 bit unsigned short from the Bytes message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 767).

6.13.2.22 `virtual std::string activemq::commands::ActiveMQBytesMessage::readUTF ()
const throw (cms::CMSEException) [virtual]`

Reads an UTF String from the BytesMessage stream.

Returns:

String from stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 767).

6.13.2.23 `virtual void activemq::commands::ActiveMQBytesMessage::reset ()
throw (cms::CMSEException) [virtual]`

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 767).

6.13.2.24 `virtual void activemq::commands::ActiveMQBytesMessage::setBodyBytes
(const unsigned char * buffer, std::size_t numBytes) throw (
cms::CMSEException) [virtual]`

sets the bytes given to the message body.

Parameters:

buffer Byte Buffer to copy.

numBytes Number of bytes in Buffer to copy.

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 768).

6.13.2.25 `virtual std::string activemq::commands::ActiveMQBytesMessage::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p.1749).

6.13.2.26 `virtual void activemq::commands::ActiveMQBytesMessage::writeBoolean (bool value) throw (cms::CMSException) [virtual]`

Writes a boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value - boolean to write to the stream

Exceptions:

CMSException

Implements **cms::BytesMessage** (p.768).

6.13.2.27 `virtual void activemq::commands::ActiveMQBytesMessage::writeByte (unsigned char value) throw (cms::CMSException) [virtual]`

Writes a byte to the bytes message stream as a 1-byte value.

Parameters:

value - byte to write to the stream

Exceptions:

CMSException

Implements **cms::BytesMessage** (p.768).

6.13.2.28 `virtual void activemq::commands::ActiveMQBytesMessage::writeBytes (const unsigned char * value, std::size_t offset, std::size_t length) throw (cms::CMSException) [virtual]`

Writes a portion of a byte array to the bytes message stream. size as the number of bytes to write.

Parameters:

value - bytes to write to the stream

offset - the initial offset within the byte array

length - the number of bytes to use

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 769).

6.13.2.29 **virtual void activemq::commands::ActiveMQBytesMessage::writeBytes**
 (const std::vector< unsigned char > & value) throw (cms::CMSEException
) [virtual]

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters:

value - bytes to write to the stream.

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 769).

6.13.2.30 **virtual void activemq::commands::ActiveMQBytesMessage::writeChar**
 (char value) throw (cms::CMSEException) [virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters:

value - char to write to the stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 769).

6.13.2.31 **virtual void activemq::commands::ActiveMQBytesMessage::writeDouble**
 (double value) throw (cms::CMSEException) [virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters:

value - double to write to the stream

Exceptions:

CMSEException

Implements **cms::BytesMessage** (p. 770).

6.13.2.32 virtual void activemq::commands::ActiveMQBytesMessage::writeFloat (float *value*) throw (cms::CMSException) [virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters:

value - float to write to the stream

Exceptions:

CMSException

Implements cms::BytesMessage (p. 770).

6.13.2.33 virtual void activemq::commands::ActiveMQBytesMessage::writeInt (int *value*) throw (cms::CMSException) [virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters:

value - signed int to write to the stream

Exceptions:

CMSException

Implements cms::BytesMessage (p. 770).

6.13.2.34 virtual void activemq::commands::ActiveMQBytesMessage::writeLong (long long *value*) throw (cms::CMSException) [virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters:

value - signed long long to write to the stream

Exceptions:

CMSException

Implements cms::BytesMessage (p. 771).

6.13.2.35 virtual void activemq::commands::ActiveMQBytesMessage::writeShort (short *value*) throw (cms::CMSException) [virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters:

value - signed short to write to the stream

Exceptions:

CMSException

Implements **cms::BytesMessage** (p. 771).

6.13.2.36 virtual void activemq::commands::ActiveMQBytesMessage::writeString
(const std::string & *value*) throw (cms::CMSException) [virtual]

Writes an ASCII String to the Bytes message stream.

Parameters:

value - String to write to the stream

Exceptions:

CMSException

Implements **cms::BytesMessage** (p. 771).

6.13.2.37 virtual void ac-
tivismq::commands::ActiveMQBytesMessage::writeUnsignedShort
(unsigned short *value*) throw (cms::CMSException) [virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value - unsigned short to write to the stream

Exceptions:

CMSException

Implements **cms::BytesMessage** (p. 772).

6.13.2.38 virtual void activemq::commands::ActiveMQBytesMessage::writeUTF
(const std::string & *value*) throw (cms::CMSException) [virtual]

Writes an UTF String to the BytesMessage stream.

Parameters:

value - String to write to the stream

Exceptions:

CMSException

Implements **cms::BytesMessage** (p. 772).

6.13.3 Field Documentation

6.13.3.1 `const unsigned char activemq::commands::ActiveMQBytesMessage::ID - ACTIVEMQBYTESMESSAGE = 24` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ActiveMQBytesMessage.h`

6.14 activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 178).

#include <src/main/activemq/wireformat/openwire/marshal/v3/ActiveMQBytesMessageMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller:

Public Member Functions

- **ActiveMQBytesMessageMarshaller** ()
- virtual **~ActiveMQBytesMessageMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.14.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 178).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.14.2 Constructor & Destructor Documentation

6.14.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::ActiveMQBytesMessageMarshaller()` `[inline]`

6.14.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::~~ActiveMQBytesMessageMarshaller()` `[inline, virtual]`

6.14.3 Member Function Documentation

6.14.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::createObject(const std::string& name) const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.14.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::getDataStructureType() const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.14.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::looseMarshal(commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.14.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.14.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1868).

6.14

activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller

Class Reference

181

6.14.3.6 virtual void ac-

```
ativemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::tightMarsh  
(OpenWireFormat * wireFormat, commands::DataStructure  
* dataStructure, decaf::io::DataOutputStream * dataOut,  
utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller**
(p. 1869).

6.14.3.7 virtual void ac-

```
ativemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller::tightUnmar  
(OpenWireFormat * wireFormat, commands::DataStructure *  
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream  
* bs) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller**
(p. 1869).

6.15.3 Member Function Documentation

6.15.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.15.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.15.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller::looseMarshal(commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.15.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.15.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1873).

```

6.15.3.6 virtual void ac-
        tivemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller::tightMarsh
        (OpenWireFormat * wireFormat, commands::DataStructure
        * dataStructure, decaf::io::DataOutputStream * dataOut,
        utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

```

6.15.3.7 virtual void ac-
        tivemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller::tightUnmar
        (OpenWireFormat * wireFormat, commands::DataStructure *
        dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
        * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.16.3 Member Function Documentation

6.16.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.16.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.16.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller::looseMarshal(commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.16.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.16.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1863).

6.16

activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller

Class Reference

189

```
6.16.3.6 virtual void ac-
        tivemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller::tightMarsh
        (OpenWireFormat * wireFormat, commands::DataStructure
        * dataStructure, decaf::io::DataOutputStream * dataOut,
        utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller**
(p. 1864).

```
6.16.3.7 virtual void ac-
        tivemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller::tightUnmar
        (OpenWireFormat * wireFormat, commands::DataStructure *
        dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
        * bs) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller**

6.17 activemq::core::ActiveMQConnection Class Reference

Concrete connection used for all connectors to the ActiveMQ broker.

#include <src/main/activemq/core/ActiveMQConnection.h> Inheritance diagram for activemq::core::ActiveMQConnection:

Public Member Functions

- **ActiveMQConnection** (const **Pointer**< **transport::Transport** > &transport, const **Pointer**< **decaf::util::Properties** > &properties)
Constructor.
- virtual ~**ActiveMQConnection** ()
- virtual void **removeSession** (**ActiveMQSession** *session) throw (cms::CMSException)
Removes the session resources for the given session instance.
- virtual void **addProducer** (**ActiveMQProducer** *producer) throw (cms::CMSException)
Adds an active Producer to the Set of known producers.
- virtual void **removeProducer** (const **Pointer**< **commands::ProducerId** > &producerId) throw (cms::CMSException)
Removes an active Producer to the Set of known producers.
- virtual void **addDispatcher** (const **Pointer**< **commands::ConsumerId** > &consumer, **Dispatcher** *dispatcher) throw (cms::CMSException)
Adds a dispatcher for a consumer.
- virtual void **removeDispatcher** (const **Pointer**< **commands::ConsumerId** > &consumer) throw (cms::CMSException)
Removes the dispatcher for a consumer.
- virtual void **sendPullRequest** (const **commands::ConsumerInfo** *consumer, long long timeout) throw (exceptions::ActiveMQException)
If supported sends a message pull request to the service provider asking for the delivery of a new message.
- bool **isClosed** () const
Checks if this connection has been closed.
- bool **isStarted** () const
Check if this connection has been started.
- virtual void **destroyDestination** (const **commands::ActiveMQDestination** *destination) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalStateException, decaf::lang::exceptions::UnsupportedOperationException, activemq::exceptions::ActiveMQException)

Requests that the Broker removes the given Destination.

- virtual void **destroyDestination** (const **cms::Destination** *destination) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalStateException, decaf::lang::exceptions::UnsupportedOperationException, activemq::exceptions::ActiveMQException)

Requests that the Broker removes the given Destination.

- virtual const **cms::ConnectionMetaData** * **getMetaData** () const throw (cms::CMSEException)

Gets the metadata for this connection.

- virtual **cms::Session** * **createSession** () throw (cms::CMSEException)

Creates a new Session to work for this Connection.

- virtual **cms::Session** * **createSession** (cms::Session::AcknowledgeMode ackMode) throw (cms::CMSEException)

Creates a new Session to work for this Connection using the specified acknowledgment mode.

- virtual std::string **getClientID** () const

Get the Client Id for this session.

- virtual void **close** () throw (cms::CMSEException)

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

- virtual void **start** () throw (cms::CMSEException)

Starts or (restarts) a connections delivery of incoming messages.

- virtual void **stop** () throw (cms::CMSEException)

Stop the flow of incoming messages.

- virtual **cms::ExceptionListener** * **getExceptionListener** () const

Gets the registered Exception Listener for this connection.

- virtual void **setExceptionListener** (cms::ExceptionListener *listener)

Sets the registered Exception Listener for this connection.

- virtual void **onCommand** (const **Pointer**< **commands::Command** > &command)

*Event handler for the receipt of a non-response command from the **transport** (p. 67).*

- virtual void **onException** (const **decaf::lang::Exception** &ex)

*Event handler for an exception from a command **transport** (p. 67).*

- virtual void **transportInterrupted** ()

*The **transport** (p. 67) has suffered an interruption from which it hopes to recover.*

- const **commands::ConnectionInfo** & **getConnectionInfo** () const throw (exceptions::ActiveMQException)

Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.

- `const commands::ConnectionId & getConnectionId () const throw (exceptions::ActiveMQException)`

Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.

- `void oneway (Pointer< commands::Command > command) throw (activemq::exceptions::ActiveMQException)`

Sends a oneway message.

- `void syncRequest (Pointer< commands::Command > command, unsigned int timeout=0) throw (activemq::exceptions::ActiveMQException)`

Sends a synchronous request and returns the response from the broker.

- `void disposeOf (const Pointer< commands::DataStructure > &objectId) throw (activemq::exceptions::ActiveMQException)`

Sends a message to the broker to dispose of the given resource using an async oneway call.

- `void disposeOf (const Pointer< commands::DataStructure > &objectId, unsigned int timeout) throw (activemq::exceptions::ActiveMQException)`

Sends a message to the broker to dispose of the given resource using a timed request.

- `virtual void fire (const exceptions::ActiveMQException &ex)`

Notify the exception listener.

6.17.1 Detailed Description

Concrete connection used for all connectors to the ActiveMQ broker.

6.17.2 Constructor & Destructor Documentation

6.17.2.1 `activemq::core::ActiveMQConnection::ActiveMQConnection (const Pointer< transport::Transport > & transport, const Pointer< decaf::util::Properties > & properties)`

Constructor.

Parameters:

transport (p. 67) The Transport requested for this connection to the Broker.

properties The Properties that were defined for this connection

6.17.2.2 `virtual activemq::core::ActiveMQConnection::~~ActiveMQConnection ()`
[virtual]

6.17.3 Member Function Documentation

6.17.3.1 `virtual void activemq::core::ActiveMQConnection::addDispatcher`
(const Pointer< commands::ConsumerId > & *consumer*, Dispatcher *
dispatcher) throw (cms::CMSEException) [virtual]

Adds a dispatcher for a consumer.

Parameters:

consumer - The consumer for which to register a dispatcher.

dispatcher - The dispatcher to handle incoming messages for the consumer.

6.17.3.2 `virtual void activemq::core::ActiveMQConnection::addProducer`
(ActiveMQProducer * *producer*) throw (cms::CMSEException) [virtual]

Adds an active Producer to the Set of known producers.

Parameters:

producer - The Producer to add from the the known set.

6.17.3.3 `virtual void activemq::core::ActiveMQConnection::close () throw (`
`cms::CMSEException)` [virtual]

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions:

CMSEException

Implements `cms::Connection` (p. 942).

6.17.3.4 `virtual cms::Session* activemq::core::ActiveMQConnection::createSession`
(cms::Session::AcknowledgeMode *ackMode*) throw (cms::CMSEException)
[virtual]

Creates a new Session to work for this Connection using the specified acknowledgment mode.

Parameters:

ackMode the Acknowledgment Mode to use.

Exceptions:

CMSEException

Implements `cms::Connection` (p. 942).

6.17.3.5 `virtual cms::Session* activemq::core::ActiveMQConnection::createSession
() throw (cms::CMSException) [virtual]`

Creates a new Session to work for this Connection.

Exceptions:

CMSException

Implements `cms::Connection` (p. 943).

6.17.3.6 `virtual void activemq::core::ActiveMQConnection::destroyDestination
(const cms::Destination * destination) throw (
decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalStateException, de-
cafe::lang::exceptions::UnsupportedOperationException,
activemq::exceptions::ActiveMQException) [virtual]`

Requests that the Broker removes the given Destination. Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters:

destination The CMS Destination the Broker will be requested to remove.

Exceptions:

NullPointerException If the passed Destination is Null

IllegalStateException If the connection is closed.

UnsupportedOperationException If the wire format in use does not support this operation.

ActiveMQException If any other error occurs during the attempt to destroy the destination.

6.17.3.7 `virtual void activemq::core::ActiveMQConnection::destroyDestination
(const commands::ActiveMQDestination * destination)
throw (decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalStateException, de-
cafe::lang::exceptions::UnsupportedOperationException,
activemq::exceptions::ActiveMQException) [virtual]`

Requests that the Broker removes the given Destination. Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters:

destination The Destination the Broker will be requested to remove.

Exceptions:

NullPointerException If the passed Destination is Null

IllegalStateException If the connection is closed.

UnsupportedOperationException If the wire format in use does not support this operation.

ActiveMQException If any other error occurs during the attempt to destroy the destination.

6.17.3.8 `void activemq::core::ActiveMQConnection::disposeOf (const Pointer< commands::DataStructure > & objectId, unsigned int timeout) throw (activemq::exceptions::ActiveMQException)`

Sends a message to the broker to dispose of the given resource using a timed request.

Parameters:

objectId The ID of the resource to be released.

timeout The time to wait for a response that the object is disposed.

Exceptions:

ConnectorException if any problems occur from sending the message.

6.17.3.9 `void activemq::core::ActiveMQConnection::disposeOf (const Pointer< commands::DataStructure > & objectId) throw (activemq::exceptions::ActiveMQException)`

Sends a message to the broker to dispose of the given resource using an async oneway call.

Parameters:

objectId The ID of the resource to be released.

Exceptions:

ConnectorException if any problems occur from sending the message.

6.17.3.10 `virtual void activemq::core::ActiveMQConnection::fire (const exceptions::ActiveMQException & ex) [virtual]`

Notify the exception listener.

Parameters:

ex the exception to fire

6.17.3.11 `virtual std::string activemq::core::ActiveMQConnection::getClientID () const [virtual]`

Get the Client Id for this session.

Returns:

string version of Client Id

Implements **cms::Connection** (p. 943).

6.17.3.12 `const commands::ConnectionId& activemq::core::ActiveMQConnection::getConnectionId ()
const throw (exceptions::ActiveMQException)`

Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.

6.17.3.13 `const commands::ConnectionInfo& activemq::core::ActiveMQConnection::getConnectionInfo ()
const throw (exceptions::ActiveMQException)`

Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.

6.17.3.14 `virtual cms::ExceptionListener* activemq::core::ActiveMQConnection::getExceptionListener
() const [inline, virtual]`

Gets the registered Exception Listener for this connection.

Returns:

pointer to an exception listener or NULL

Implements **cms::Connection** (p. 943).

6.17.3.15 `virtual const cms::ConnectionMetaData* activemq::core::ActiveMQConnection::getMetaData () const throw (cms::CMSException) [inline, virtual]`

Gets the metadata for this connection.

Returns:

the connection MetaData pointer (caller does not own it).

Exceptions:

CMSException if the provider fails to get the connection metadata for this connection.

See also:

ConnectionMetaData

Since:

2.0

Implements **cms::Connection** (p. 943).

6.17.3.16 `bool activemq::core::ActiveMQConnection::isClosed () const [inline]`

Checks if this connection has been closed.

Returns:

true if the connection is closed

6.17.3.17 bool activemq::core::ActiveMQConnection::isStarted () const [inline]

Check if this connection has been started.

Returns:

true if the start method has been called.

6.17.3.18 virtual void activemq::core::ActiveMQConnection::onCommand (const Pointer< commands::Command > & *command*) [virtual]

Event handler for the receipt of a non-response command from the **transport** (p. 67).

Parameters:

command the received command object.

Implements **activemq::transport::TransportListener** (p. 2624).

6.17.3.19 void activemq::core::ActiveMQConnection::oneway (Pointer< commands::Command > *command*) throw (activemq::exceptions::ActiveMQException)

Sends a oneway message.

Parameters:

command The message to send.

Exceptions:

ConnectorException if not currently connected, or if the operation fails for any reason.

6.17.3.20 virtual void activemq::core::ActiveMQConnection::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command **transport** (p. 67).

Parameters:

ex The exception.

Implements **activemq::transport::TransportListener** (p. 2625).

6.17.3.21 virtual void activemq::core::ActiveMQConnection::removeDispatcher (const Pointer< commands::ConsumerId > & *consumer*) throw (cms::CMSException) [virtual]

Removes the dispatcher for a consumer.

Parameters:

consumer - The consumer for which to remove the dispatcher.

6.17.3.22 `virtual void activemq::core::ActiveMQConnection::removeProducer (const Pointer< commands::ProducerId > & producerId) throw (cms::CMSException) [virtual]`

Removes an active Producer to the Set of known producers.

Parameters:

producerId - The ProducerId to remove from the the known set.

6.17.3.23 `virtual void activemq::core::ActiveMQConnection::removeSession (ActiveMQSession * session) throw (cms::CMSException) [virtual]`

Removes the session resources for the given session instance.

Parameters:

session The session to be unregistered from this connection.

6.17.3.24 `virtual void activemq::core::ActiveMQConnection::sendPullRequest (const commands::ConsumerInfo * consumer, long long timeout) throw (exceptions::ActiveMQException) [virtual]`

If supported sends a message pull request to the service provider asking for the delivery of a new message. This is used in the case where the service provider has been configured with a zero prefetch or is only capable of delivering messages on a pull basis.

Parameters:

consumer - the ConsumerInfo for the requesting Consumer.

timeout - the time that the client is willing to wait.

6.17.3.25 `virtual void activemq::core::ActiveMQConnection::setExceptionHandler (cms::ExceptionHandler * listener) [inline, virtual]`

Sets the registered Exception Listener for this connection.

Parameters:

listener pointer to and ExceptionListener

Implements `cms::Connection` (p. 944).

6.17.3.26 `virtual void activemq::core::ActiveMQConnection::start () throw (cms::CMSException) [virtual]`

Starts or (restarts) a connections delivery of incoming messages.

Exceptions:

CMSException

Implements **cms::Startable** (p. 2413).

6.17.3.27 `virtual void activemq::core::ActiveMQConnection::stop () throw (cms::CMSException) [virtual]`

Stop the flow of incoming messages.

Exceptions:

CMSException

Implements **cms::Stoppable** (p. 2471).

6.17.3.28 `void activemq::core::ActiveMQConnection::syncRequest (Pointer< commands::Command > command, unsigned int timeout = 0) throw (activemq::exceptions::ActiveMQException)`

Sends a synchronous request and returns the response from the broker. Converts any error responses into an exception.

Parameters:

command The request command.

timeout The time to wait for a response, default is zero or infinite.

Exceptions:

ConnectorException thrown if an error response was received from the broker, or if any other error occurred.

6.17.3.29 `virtual void activemq::core::ActiveMQConnection::transportInterrupted () [virtual]`

The **transport** (p. 67) has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2625).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQConnection.h`

6.18 activemq::core::ActiveMQConnectionFactory Class Reference

#include <src/main/activemq/core/ActiveMQConnectionFactory.h> Inheritance diagram for activemq::core::ActiveMQConnectionFactory:

Public Member Functions

- **ActiveMQConnectionFactory** ()
- **ActiveMQConnectionFactory** (const std::string &url, const std::string &username="", const std::string &password="")
Constructor.
- virtual ~**ActiveMQConnectionFactory** ()
- virtual **cms::Connection** * **createConnection** () throw (cms::CMSException)
Creates a connection with the default user identity.
- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password) throw (cms::CMSException)
Creates a connection with the specified user identity.
- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password, const std::string &clientId) throw (cms::CMSException)
Creates a connection with the specified user identity.
- virtual void **setUsername** (const std::string &username)
Sets the username that should be used when creating a new connection.
- virtual const std::string & **getUsername** () const
Gets the username that this factory will use when creating a new connection instance.
- virtual void **setPassword** (const std::string &password)
Sets the password that should be used when creating a new connection.
- virtual const std::string & **getPassword** () const
Gets the password that this factory will use when creating a new connection instance.
- virtual void **setBrokerURL** (const std::string &brokerURL)
Sets the Broker URL that should be used when creating a new connection instance.
- virtual const std::string & **getBrokerURL** () const
Gets the Broker URL that this factory will use when creating a new connection instance.

Static Public Member Functions

- static **cms::Connection * createConnection** (const std::string &url, const std::string &username, const std::string &password, const std::string &clientId="") throw (cms::CMSEException)

Creates a connection with the specified user identity.

6.18.1 Constructor & Destructor Documentation

6.18.1.1 **activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory**
()

6.18.1.2 **activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory**
(const std::string & url, const std::string & username = "", const
std::string & password = "")

Constructor.

Parameters:

url the URL of the Broker we are connecting to.

username to authenticate with, defaults to ""

password to authenticate with, defaults to ""

6.18.1.3 **virtual**
activemq::core::ActiveMQConnectionFactory::~~ActiveMQConnectionFactory
() [inline, virtual]

6.18.2 Member Function Documentation

6.18.2.1 **static cms::Connection* ac-**
tivemq::core::ActiveMQConnectionFactory::createConnection (const
std::string & url, const std::string & username, const std::string &
password, const std::string & *clientId* = "") throw (cms::CMSEException
) [static]

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Parameters:

url the URL of the Broker we are connecting to.

username to authenticate with

password to authenticate with

clientId to assign to connection, defaults to ""

Exceptions:

CMSEException.

6.18.2.2 `virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & username, const std::string & password, const std::string & clientId) throw (cms::CMSEException) [virtual]`

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username to authenticate with

password to authenticate with

clientId to assign to connection if "" then a random client Id is created for this connection.

Returns:

a Connection Pointer

Exceptions:

CMSEException

Implements `cms::ConnectionFactory` (p. 979).

6.18.2.3 `virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & username, const std::string & password) throw (cms::CMSEException) [virtual]`

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username to authenticate with

password to authenticate with

Returns:

a Connection Pointer

Exceptions:

CMSEException

Implements `cms::ConnectionFactory` (p. 980).

6.18.2.4 `virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection () throw (cms::CMSEException) [virtual]`

Creates a connection with the default user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Returns:

a Connection Pointer

Exceptions:

CMSException

Implements **cms::ConnectionFactory** (p. 980).

6.18.2.5 `virtual const std::string& activemq::core::ActiveMQConnectionFactory::getBrokerURL () const [inline, virtual]`

Gets the Broker URL that this factory will use when creating a new connection instance.

Returns:

brokerURL string

6.18.2.6 `virtual const std::string& activemq::core::ActiveMQConnectionFactory::getPassword () const [inline, virtual]`

Gets the password that this factory will use when creating a new connection instance.

Returns:

password string, "" for default credentials

6.18.2.7 `virtual const std::string& activemq::core::ActiveMQConnectionFactory::getUsername () const [inline, virtual]`

Gets the username that this factory will use when creating a new connection instance.

Returns:

username string, "" for default credentials

6.18.2.8 `virtual void activemq::core::ActiveMQConnectionFactory::setBrokerURL (const std::string & brokerURL) [inline, virtual]`

Sets the Broker URL that should be used when creating a new connection instance.

Parameters:

brokerURL string

6.18.2.9 `virtual void activemq::core::ActiveMQConnectionFactory::setPassword
(const std::string & password)` [inline, virtual]

Sets the password that should be used when creating a new connection.

Parameters:

password string

6.18.2.10 `virtual void activemq::core::ActiveMQConnectionFactory::setUsername
(const std::string & username)` [inline, virtual]

Sets the username that should be used when creating a new connection.

Parameters:

username string

The documentation for this class was generated from the following file:

6.19 activemq::core::ActiveMQConnectionMetaData Class Reference

This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 190) class.

#include <src/main/activemq/core/ActiveMQConnectionMetaData.h> Inheritance diagram for activemq::core::ActiveMQConnectionMetaData:

Public Member Functions

- **ActiveMQConnectionMetaData** ()
- virtual **~ActiveMQConnectionMetaData** ()
- virtual std::string **getCMSVersion** () const throw (cms::CMSException)
Gets the CMS API version.
- virtual int **getCMSMajorVersion** () const throw (cms::CMSException)
Gets the CMS major version number.
- virtual int **getCMSMinorVersion** () const throw (cms::CMSException)
Gets the CMS minor version number.
- virtual std::string **getCMSProviderName** () const throw (cms::CMSException)
Gets the CMS provider name.
- virtual std::string **getProviderVersion** () const throw (cms::CMSException)
Gets the CMS provider version.
- virtual int **getProviderMajorVersion** () const throw (cms::CMSException)
Gets the CMS provider major version number.
- virtual int **getProviderMinorVersion** () const throw (cms::CMSException)
Gets the CMS provider minor version number.
- virtual std::vector< std::string > **getCMSXPropertyNames** () const throw (cms::CMSException)
Gets an Vector of the CMSX property names.

6.19.1 Detailed Description

This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 190) class.

Since:

3.0

6.19.2 Constructor & Destructor Documentation

6.19.2.1 `activemq::core::ActiveMQConnectionMetaData::ActiveMQConnectionMetaData()`

6.19.2.2 `virtual activemq::core::ActiveMQConnectionMetaData::~~ActiveMQConnectionMetaData()` [virtual]

6.19.3 Member Function Documentation

6.19.3.1 `virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMajorVersion()`
`const throw (cms::CMSEException)` [virtual]

Gets the CMS major version number.

Returns:

the CMS API major version number

Exceptions:

CMSEException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements `cms::ConnectionMetaData` (p.1016).

6.19.3.2 `virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMinorVersion()`
`const throw (cms::CMSEException)` [virtual]

Gets the CMS minor version number.

Returns:

the CMS API minor version number

Exceptions:

CMSEException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements `cms::ConnectionMetaData` (p.1016).

6.19.3.3 `virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSProviderName()`
`const throw (cms::CMSEException)` [virtual]

Gets the CMS provider name.

Returns:

the CMS provider name

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p.1016).

6.19.3.4 `virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSVersion () const throw (cms::CMSException) [virtual]`

Gets the CMS API version.

Returns:

the CMS API Version in String form.

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p.1017).

6.19.3.5 `virtual std::vector<std::string> activemq::core::ActiveMQConnectionMetaData::getCMSXPropertyNames () const throw (cms::CMSException) [virtual]`

Gets an Vector of the CMSX property names.

Returns:

an Vector of CMSX property names

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p.1017).

6.19.3.6 `virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMajorVersion () const throw (cms::CMSException) [virtual]`

Gets the CMS provider major version number.

Returns:

the CMS provider major version number

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p.1017).

6.19.3.7 `virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMinorVersion () const throw (cms::CMSException) [virtual]`

Gets the CMS provider minor version number.

Returns:

the CMS provider minor version number

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p.1017).

6.19.3.8 `virtual std::string activemq::core::ActiveMQConnectionMetaData::getProviderVersion () const throw (cms::CMSException) [virtual]`

Gets the CMS provider version.

Returns:

the CMS provider version

Exceptions:

CMSException If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p.1018).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQConnectionMetaData.h`

6.20 activemq::core::ActiveMQConnectionSupport Class Reference

#include <src/main/activemq/core/ActiveMQConnectionSupport.h> Inheritance diagram for activemq::core::ActiveMQConnectionSupport:

Public Member Functions

- **ActiveMQConnectionSupport** (const **Pointer**< **transport::Transport** > &transport, const **Pointer**< **decaf::util::Properties** > &properties)
*Creates an instance of the **ActiveMQConnectionSupport** (p. 209) class, the most common properties for a connection are pulled from the properties instance or are set to defaults.*
- virtual ~**ActiveMQConnectionSupport** ()
- virtual void **startupTransport** () throw (decaf::lang::Exception)
Starts the Transport, this should initiate the connection between this client and the Transports endpoint.
- virtual void **shutdownTransport** () throw (decaf::lang::Exception)
Closes this object and deallocates the appropriate resources.
- const **decaf::util::Properties** & **getProperties** () const
Gets the Properties object that this Config object was initialized with.
- **transport::Transport** & **getTransport** () const
Gets the Transport Configured for this Connection.
- bool **isAlwaysSyncSend** () const
Gets if the Connection should always send things Synchronously.
- void **setAlwaysSyncSend** (bool value)
Sets if the Connection should always send things Synchronously.
- bool **isUseAsyncSend** () const
Gets if the useAsyncSend option is set.
- void **setUseAsyncSend** (bool value)
Sets the useAsyncSend option.
- unsigned int **getSendTimeout** () const
Gets the assigned send timeout for this Connector.
- void **setSendTimeout** (unsigned int timeout)
Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.
- unsigned int **getCloseTimeout** () const
Gets the assigned close timeout for this Connector.

- void **setCloseTimeout** (unsigned int timeout)
Sets the close timeout to use when sending the disconnect request.
- unsigned int **getProducerWindowSize** () const
Gets the configured producer window size for Producers that are created from this connector.
- void **setProducerWindowSize** (unsigned int windowSize)
Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.
- std::string **getUsername** () const
Gets the Configured Username.
- void **setUsername** (const std::string &username)
Sets the Username.
- std::string **getPassword** () const
Gets the Configured Password.
- void **setPassword** (const std::string &password)
Sets the Password.
- std::string **getClientId** () const
Gets the Configured Client Id.
- void **setClientId** (const std::string &clientId)
Sets the Client Id.
- long long **getNextSessionId** ()
Get the Next available Session Id.
- long long **getNextTempDestinationId** ()
Get the Next Temporary Destination Id.
- virtual void **transportResumed** ()
*The **transport** (p. 67) has resumed after an interruption.*

6.20.1 Constructor & Destructor Documentation

6.20.1.1 **activemq::core::ActiveMQConnectionSupport::ActiveMQConnectionSupport** (const Pointer< transport::Transport > & *transport*, const Pointer< decaf::util::Properties > & *properties*)

Creates an instance of the **ActiveMQConnectionSupport** (p. 209) class, the most common properties for a connection are pulled from the properties instance or are set to defaults.

Parameters:

transport (p. 67) The Transport that this Connection will use for sending Commands to the Broker.

properties The URI configured properties for this connection.

6.20.1.2 `virtual
activemq::core::ActiveMQConnectionSupport::~~ActiveMQConnectionSupport
() [virtual]`

6.20.2 Member Function Documentation

6.20.2.1 `std::string activemq::core::ActiveMQConnectionSupport::getClientId ()
const [inline]`

Gets the Configured Client Id.

Returns:

the clientId.

6.20.2.2 `unsigned int ac-
tivemq::core::ActiveMQConnectionSupport::getCloseTimeout () const
[inline]`

Gets the assigned close timeout for this Connector.

Returns:

the close timeout configured in the connection uri

6.20.2.3 `long long activemq::core::ActiveMQConnectionSupport::getNextSessionId
() [inline]`

Get the Next available Session Id.

Returns:

the next id in the sequence.

6.20.2.4 `long long ac-
tivemq::core::ActiveMQConnectionSupport::getNextTempDestinationId ()
[inline]`

Get the Next Temporary Destination Id.

Returns:

the next id in the sequence.

6.20.2.5 `std::string activemq::core::ActiveMQConnectionSupport::getPassword ()
const [inline]`

Gets the Configured Password.

Returns:

the password.

6.20.2.6 `unsigned int activemq::core::ActiveMQConnectionSupport::getProducerWindowSize () const [inline]`

Gets the configured producer window size for Producers that are created from this connector. This only applies if there is no send timeout and the producer is able to send asynchronously.

Returns:

size in bytes of messages that this producer can produce before it must block and wait for ProducerAck messages to free resources.

6.20.2.7 `const decaf::util::Properties& activemq::core::ActiveMQConnectionSupport::getProperties () const [inline]`

Gets the Properties object that this Config object was initialized with.

Returns:

a const reference to the Connection Config.

References `decaf::lang::Pointer< T, REFCOUNTER >::get()`.

6.20.2.8 `unsigned int activemq::core::ActiveMQConnectionSupport::getSendTimeout () const [inline]`

Gets the assigned send timeout for this Connector.

Returns:

the send timeout configured in the connection uri

6.20.2.9 `transport::Transport& activemq::core::ActiveMQConnectionSupport::getTransport () const [inline]`

Gets the Transport Configured for this Connection.

Returns:

the configured **transport** (p. 67)

References `decaf::lang::Pointer< T, REFCOUNTER >::get()`.

6.20.2.10 `std::string activemq::core::ActiveMQConnectionSupport::getUsername ()`
`const [inline]`

Gets the Configured Username.

Returns:

the username.

6.20.2.11 `bool activemq::core::ActiveMQConnectionSupport::isAlwaysSyncSend ()`
`const [inline]`

Gets if the Connection should always send things Synchronously.

Returns:

true if sends should always be Synchronous.

6.20.2.12 `bool activemq::core::ActiveMQConnectionSupport::isUseAsyncSend ()`
`const [inline]`

Gets if the useAsyncSend option is set.

Returns:

true if on false if not.

6.20.2.13 `void activemq::core::ActiveMQConnectionSupport::setAlwaysSyncSend`
`(bool value) [inline]`

Sets if the Connection should always send things Synchronously.

Parameters:

value true if sends should always be Synchronous.

6.20.2.14 `void activemq::core::ActiveMQConnectionSupport::setClientId (const`
`std::string & clientId) [inline]`

Sets the Client Id.

Parameters:

clientId - The new clientId value.

6.20.2.15 `void activemq::core::ActiveMQConnectionSupport::setCloseTimeout`
`(unsigned int timeout) [inline]`

Sets the close timeout to use when sending the disconnect request.

Parameters:

timeout - The time to wait for a close message.

6.20.2.16 `void activemq::core::ActiveMQConnectionSupport::setPassword (const std::string & password) [inline]`

Sets the Password.

Parameters:

password - The new password value.

6.20.2.17 `void activemq::core::ActiveMQConnectionSupport::setProducerWindowSize (unsigned int windowSize) [inline]`

Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

Parameters:

windowSize - The size in bytes of the Producers memory window.

6.20.2.18 `void activemq::core::ActiveMQConnectionSupport::setSendTimeout (unsigned int timeout) [inline]`

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

Parameters:

timeout - The time to wait for a response.

6.20.2.19 `void activemq::core::ActiveMQConnectionSupport::setUseAsyncSend (bool value) [inline]`

Sets the useAsyncSend option.

Parameters:

value - true to activate, false to disable.

6.20.2.20 `void activemq::core::ActiveMQConnectionSupport::setUsername (const std::string & username) [inline]`

Sets the Username.

Parameters:

username - The new username value.

6.20.2.21 virtual void activemq::core::ActiveMQConnectionSupport::shutdownTransport () throw (decaf::lang::Exception) [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

Exception

6.20.2.22 virtual void activemq::core::ActiveMQConnectionSupport::startupTransport () throw (decaf::lang::Exception) [virtual]

Starts the Transport, this should initiate the connection between this client and the Transports endpoint.

Exceptions:

Exception

6.20.2.23 virtual void activemq::core::ActiveMQConnectionSupport::transportResumed () [inline, virtual]

The **transport** (p.67) has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 2625).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQConnectionSupport.h**

6.21 activemq::core::ActiveMQConstants Class Reference

Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back and forth between string and enum values.

```
#include <src/main/activemq/core/ActiveMQConstants.h>
```

Data Structures

- class `StaticInitializer`

Public Types

- enum `TransactionState` {
`TRANSACTION_STATE_BEGIN` = 0, `TRANSACTION_STATE_PREPARE` = 1, `TRANSACTION_STATE_COMMITONEPHASE` = 2, `TRANSACTION_STATE_COMMITTWOPHASE` = 3,
`TRANSACTION_STATE_ROLLBACK` = 4, `TRANSACTION_STATE_RECOVER` = 5, `TRANSACTION_STATE_FORGET` = 6, `TRANSACTION_STATE_END` = 7 }

6.21.1 Detailed Description

Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back and forth between string and enum values.

6.21.2 Member Enumeration Documentation

6.21.2.1 enum activemq::core::ActiveMQConstants::AckType

Enumerator:

```
ACK_TYPE_DELIVERED  
ACK_TYPE_POISON  
ACK_TYPE_CONSUMED  
ACK_TYPE_REDELIVERED  
ACK_TYPE_INDIVIDUAL
```

6.21.2.2 enum activemq::core::ActiveMQConstants::DestinationActions

Enumerator:

```
DESTINATION_ADD_OPERATION  
DESTINATION_REMOVE_OPERATION
```

6.21.2.3 enum activemq::core::ActiveMQConstants::DestinationOption

These values represent the options that can be appended to an Destination name, i.e. /topic/-foo?consumer.exclusive=true

Enumerator:

```
CONSUMER_PREFETCHSIZE  
CUNSUMER_MAXPENDINGMSGLIMIT  
CONSUMER_NOLOCAL  
CONSUMER_DISPATCHASYNC  
CONSUMER_RETROACTIVE  
CONSUMER_SELECTOR  
CONSUMER_EXCLUSIVE  
CONSUMER_PRIORITY  
NUM_OPTIONS
```

6.21.2.4 enum activemq::core::ActiveMQConstants::TransactionState

Enumerator:

```
TRANSACTION_STATE_BEGIN
TRANSACTION_STATE_PREPARE
TRANSACTION_STATE_COMMITONEPHASE
TRANSACTION_STATE_COMMITTWOPHASE
TRANSACTION_STATE_ROLLBACK
TRANSACTION_STATE_RECOVER
TRANSACTION_STATE_FORGET
TRANSACTION_STATE_END
```

6.21.2.5 enum activemq::core::ActiveMQConstants::URIParam

These values represent the parameters that can be added to the connection URI that affect the ActiveMQ Core API.

Enumerator:

```
CONNECTION_SENDDTIMEOUT
CONNECTION_PRODUCERWINDOWSIZE
CONNECTION_CLOSETIMEOUT
CONNECTION_ALWAYSASYNCSEND
CONNECTION_USEASYNCSEND
PARAM_USERNAME
PARAM_PASSWORD
PARAM_CLIENTID

6.22 activemq::core::ActiveMQConsumer Class Reference

#include <src/main/activemq/core/ActiveMQConsumer.h> Inheritance diagram for activemq::core::ActiveMQConsumer:

Public Member Functions

- **ActiveMQConsumer** (const **Pointer**< **commands::ConsumerInfo** > &consumerInfo, **ActiveMQSession** *session, const **Pointer**< **ActiveMQTransactionContext** > &transaction)
Constructor.
- virtual ~**ActiveMQConsumer** ()
- virtual void **start** ()
Starts the Consumer if not already started and not closed.
- virtual void **stop** ()
Stops a Consumer, the Consumer will not deliver any messages that are dispatched to it until it is started again.
- virtual void **close** () throw (cms::CMSException)
Closes the Consumer.
- virtual **cms::Message** * **receive** () throw (cms::CMSException)
Synchronously Receive a Message.
- virtual **cms::Message** * **receive** (int millisecs) throw (cms::CMSException)
Synchronously Receive a Message, time out after defined interval.
- virtual **cms::Message** * **receiveNoWait** () throw (cms::CMSException)
Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.
- virtual void **setMessageListener** (**cms::MessageListener** *listener) throw (cms::CMSException)
Sets the MessageListener that this class will send notifys on.
- virtual **cms::MessageListener** * **getMessageListener** () const throw (cms::CMSException)
Gets the MessageListener that this class will send events to.
- virtual std::string **getMessageSelector** () const throw (cms::CMSException)
Gets this message consumer's message selector expression.
- virtual void **acknowledgeMessage** (const **commands::Message** *message) throw (cms::CMSException)
Method called to acknowledge the message passed, called from a message when the mode is client ack.

- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)
Called asynchronously by the session to dispatch a message.
- void **acknowledge** () throw (cms::CMSEException)
Method called to acknowledge all messages that have been received so far.
- void **commit** () throw (exceptions::ActiveMQException)
Called to Commit the current set of messages in this Transaction.
- void **rollback** () throw (exceptions::ActiveMQException)
Called to Roll back the current set of messages in this Transaction.
- void **doClose** () throw (exceptions::ActiveMQException)
Performs the actual close operation on this consumer.
- const **commands::ConsumerInfo** & **getConsumerInfo** () const
Get the Consumer information for this consumer.
- const **commands::ConsumerId** & **getConsumerId** () const
Get the Consumer Id for this consumer.
- bool **isClosed** () const
- bool **issynchronizationRegistered** () const
*Has this Consumer Transaction **Synchronization** (p. 2516) been added to the transaction.*
- void **setSynchronizationRegistered** (bool value)
*Sets the **Synchronization** (p. 2516) Registered **state** (p. 65) of this consumer.*
- bool **iterate** ()
Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.
- void **deliverAcks** () throw (exceptions::ActiveMQException)
Forces this consumer to send all pending acks to the broker.
- void **clearMessagesInProgress** ()
Called on a Failover to clear any pending messages.

Protected Member Functions

- **Pointer**< **MessageDispatch** > **dequeue** (long long timeout) throw (cms::CMSEException)
Used by synchronous receive methods to wait for messages to come in.
- void **beforeMessageIsConsumed** (const **Pointer**< **commands::MessageDispatch** > &dispatch)
Pre-consume processing.

- void **afterMessageIsConsumed** (const Pointer< commands::MessageDispatch > &dispatch, bool messageExpired)

Post-consume processing.

6.22.1 Constructor & Destructor Documentation

- 6.22.1.1** **activemq::core::ActiveMQConsumer::ActiveMQConsumer** (const Pointer< commands::ConsumerInfo > & *consumerInfo*, ActiveMQSession * *session*, const Pointer< ActiveMQTransactionContext > & *transaction*)

Constructor.

- 6.22.1.2** **virtual activemq::core::ActiveMQConsumer::~~ActiveMQConsumer** ()
[virtual]

6.22.2 Member Function Documentation

- 6.22.2.1** **void activemq::core::ActiveMQConsumer::acknowledge** () throw (cms::CMSException)

Method called to acknowledge all messages that have been received so far.

Exceptions:

CMSException

- 6.22.2.2** **virtual void activemq::core::ActiveMQConsumer::acknowledgeMessage** (const commands::Message * *message*) throw (cms::CMSException)
[virtual]

Method called to acknowledge the message passed, called from a message when the mode is client ack.

Parameters:

message the Message to Acknowledge

Exceptions:

CMSException

Implements **activemq::core::ActiveMQAckHandler** (p.145).

- 6.22.2.3** **void activemq::core::ActiveMQConsumer::afterMessageIsConsumed** (const Pointer< commands::MessageDispatch > & *dispatch*, bool *messageExpired*) [protected]

Post-consume processing.

Parameters:

dispatch - the consumed message

messageExpired - flag indicating if the message has expired.

6.22.2.4 `void activemq::core::ActiveMQConsumer::beforeMessageIsConsumed (const Pointer< commands::MessageDispatch > & dispatch)` [protected]

Pre-consume processing.

Parameters:

dispatch - the message being consumed.

6.22.2.5 `void activemq::core::ActiveMQConsumer::clearMessagesInProgress ()`

Called on a Failover to clear any pending messages.

6.22.2.6 `virtual void activemq::core::ActiveMQConsumer::close () throw (cms::CMSException)` [virtual]

Closes the Consumer. This will return all allocated resources and purge any outstanding messages. This method will block if there is a call to receive in progress, or a dispatch to a MessageListener in place

Exceptions:

CMSException

Implements `cms::Closeable` (p. 838).

6.22.2.7 `void activemq::core::ActiveMQConsumer::commit () throw (exceptions::ActiveMQException)`

Called to Commit the current set of messages in this Transaction.

Exceptions:

ActiveMQException

6.22.2.8 `void activemq::core::ActiveMQConsumer::deliverAcks () throw (exceptions::ActiveMQException)`

Forces this consumer to send all pending acks to the broker.

6.22.2.9 `Pointer<MessageDispatch> activemq::core::ActiveMQConsumer::dequeue (long long timeout) throw (cms::CMSException)` [protected]

Used by synchronous receive methods to wait for messages to come in.

Parameters:

timeout - The maximum number of milliseconds to wait before returning. If -1, it will block until a messages is received or this consumer is closed. If 0, will not block at all. If > 0, will wait at a maximum the specified number of milliseconds before returning.

Returns:

the message, if received within the allotted time. Otherwise NULL.

Exceptions:

InvalidStateException if this consumer is closed upon entering this method.

6.22.2.10 virtual void activemq::core::ActiveMQConsumer::dispatch (const Pointer< MessageDispatch > & message) [virtual]

Called asynchronously by the session to dispatch a message.

Parameters:

message dispatch object pointer

Implements **activemq::core::Dispatcher** (p. 1230).

6.22.2.11 void activemq::core::ActiveMQConsumer::doClose () throw (exceptions::ActiveMQException)

Performs the actual close operation on this consumer.

Exceptions:

ActiveMQException

6.22.2.12 const commands::ConsumerId& activemq::core::ActiveMQConsumer::getConsumerId () const [inline]

Get the Consumer Id for this consumer.

Returns:

Reference to a Consumer Id Object

6.22.2.13 const commands::ConsumerInfo& activemq::core::ActiveMQConsumer::getConsumerInfo () const [inline]

Get the Consumer information for this consumer.

Returns:

Reference to a Consumer Info Object

6.22.2.14 `virtual cms::MessageListener* activemq::core::ActiveMQConsumer::getMessageListener () const throw (cms::CMSEException) [inline, virtual]`

Gets the MessageListener that this class will send events to.

Returns:

the currently registered MessageListener interface pointer.

Implements `cms::MessageConsumer` (p. 1796).

6.22.2.15 `virtual std::string activemq::core::ActiveMQConsumer::getMessageSelector () const throw (cms::CMSEException) [virtual]`

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

cms::CMSEException (p. 850)

Implements `cms::MessageConsumer` (p. 1796).

6.22.2.16 `bool activemq::core::ActiveMQConsumer::isClosed () const [inline]`

Returns:

if this Consumer has been closed.

6.22.2.17 `bool activemq::core::ActiveMQConsumer::issynchronizationRegistered () const [inline]`

Has this Consumer Transaction **Synchronization** (p. 2516) been added to the transaction.

Returns:

true if the synchronization has been added.

6.22.2.18 `bool activemq::core::ActiveMQConsumer::iterate ()`

Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.

6.22.2.19 `virtual cms::Message* activemq::core::ActiveMQConsumer::receive (int millisecs) throw (cms::CMSEException) [virtual]`

Synchronously Receive a Message, time out after defined interval. Returns null if nothing read.

Parameters:

millisecs the time in milliseconds to wait before returning

Returns:

new message or null on timeout

Exceptions:

CMSException

Implements **cms::MessageConsumer** (p. 1796).

6.22.2.20 `virtual cms::Message* activemq::core::ActiveMQConsumer::receive ()
throw (cms::CMSException) [virtual]`

Synchronously Receive a Message.

Returns:

new message

Exceptions:

CMSException

Implements **cms::MessageConsumer** (p. 1797).

6.22.2.21 `virtual cms::Message* ac-
tivismq::core::ActiveMQConsumer::receiveNoWait ()
throw (cms::CMSException) [virtual]`

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message

Exceptions:

CMSException

Implements **cms::MessageConsumer** (p. 1797).

6.22.2.22 `void activemq::core::ActiveMQConsumer::rollback () throw (
exceptions::ActiveMQException)`

Called to Roll back the current set of messages in this Transaction.

Exceptions:

ActiveMQException

6.22.2.23 `virtual void activemq::core::ActiveMQConsumer::setMessageListener (cms::MessageListener * listener) throw (cms::CMSException)`
[virtual]

Sets the MessageListener that this class will send notifs on.

Parameters:

listener MessageListener interface pointer

Implements `cms::MessageConsumer` (p. 1797).

6.22.2.24 `void activemq::core::ActiveMQConsumer::setSynchronizationRegistered (bool value)` [inline]

Sets the **Synchronization** (p. 2516) Registered **state** (p. 65) of this consumer.

Parameters:

value - true if registered false otherwise.

6.22.2.25 `virtual void activemq::core::ActiveMQConsumer::start ()` [virtual]

Starts the Consumer if not already started and not closed. A consumer will no deliver messages until started.

6.22.2.26 `virtual void activemq::core::ActiveMQConsumer::stop ()` [virtual]

Stops a Consumer, the Consumer will not deliver any messages that are dispatched to it until it is started again. A Closed Consumer is also a stopped consumer.

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQConsumer.h`

6.23 activemq::library::ActiveMQCPP Class Reference

```
#include <src/main/activemq/library/ActiveMQCPP.h>
```

Public Member Functions

- virtual `~ActiveMQCPP ()`

Static Public Member Functions

- static void `initializeLibrary ()`
*Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal Registry objects and initialize the Decaf **library** (p. 64).*
- static void `initializeLibrary (int argc, char **argv)`
*Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf **library** (p. 64).*
- static void `shutdownLibrary ()`
Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point.

Protected Member Functions

- `ActiveMQCPP ()`
- `ActiveMQCPP (const ActiveMQCPP &)`
- `ActiveMQCPP & operator= (const ActiveMQCPP &)`

6.23.1 Constructor & Destructor Documentation

6.23.1.1 `activemq::library::ActiveMQCPP::ActiveMQCPP () [inline, protected]`

6.23.1.2 `activemq::library::ActiveMQCPP::ActiveMQCPP (const ActiveMQCPP &) [protected]`

6.23.1.3 `virtual activemq::library::ActiveMQCPP::~~ActiveMQCPP () [inline, virtual]`

6.23.2 Member Function Documentation

6.23.2.1 `static void activemq::library::ActiveMQCPP::initializeLibrary (int argc, char ** argv) [static]`

Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf **library** (p.64). This method takes the args passed to the main method of process for use is setting system properties and configuring the ActiveMQ-CPP Library.

Parameters:

argc - the count of arguments passed to this Process.

argv - the array of string arguments passed to this process.

Exceptions:

runtime_error if an error occurs while initializing this **library** (p. 64).

6.23.2.2 static void activemq::library::ActiveMQCPP::initializeLibrary () [static]

Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal Registry objects and initialize the Decaf **library** (p. 64).

Exceptions:

runtime_error if an error occurs while initializing this **library** (p. 64).

6.23.2.3 ActiveMQCPP& activemq::library::ActiveMQCPP::operator= (const ActiveMQCPP &) [protected]

6.23.2.4 static void activemq::library::ActiveMQCPP::shutdownLibrary () [static]

Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point. All the user created ActiveMQ-CPP objects and Decaf Library objects should have been destroyed by the time this method is called.

The documentation for this class was generated from the following file:

- src/main/activemq/library/**ActiveMQCPP.h**

6.24 activemq::commands::ActiveMQDestination Class Reference

#include <src/main/activemq/commands/ActiveMQDestination.h> Inheritance diagram for activemq::commands::ActiveMQDestination:

Data Structures

- struct **DestinationFilter**

Public Member Functions

- **ActiveMQDestination** ()
- **ActiveMQDestination** (const std::string &**physicalName**)
- virtual ~**ActiveMQDestination** ()
- virtual **ActiveMQDestination** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*

6.24.1 Constructor & Destructor Documentation

6.24.1.1 `activemq::commands::ActiveMQDestination::ActiveMQDestination ()`

6.24.1.2 `activemq::commands::ActiveMQDestination::ActiveMQDestination (const std::string & physicalName)`

6.24.1.3 `virtual
activemq::commands::ActiveMQDestination::~~ActiveMQDestination ()
[inline, virtual]`

6.24.2 Member Function Documentation

6.24.2.1 `virtual ActiveMQDestination* ac-
tivemq::commands::ActiveMQDestination::cloneDataStructure () const
[inline, virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

Reimplemented in `activemq::commands::ActiveMQQueue` (p. 338),
`activemq::commands::ActiveMQTempDestination` (p. 400), **ac-**
`tivemq::commands::ActiveMQTempQueue` (p. 416), **ac-**
`tivemq::commands::ActiveMQTempTopic` (p. 433), and **ac-**
`tivemq::commands::ActiveMQTopic` (p. 466).

6.24.2.2 `virtual void ac-`
`tivemq::commands::ActiveMQDestination::copyDataStructure (const`
`DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

`src` - Source Object

Reimplemented in `activemq::commands::ActiveMQQueue` (p. 338),
`activemq::commands::ActiveMQTempDestination` (p. 400), **ac-**
`tivemq::commands::ActiveMQTempQueue` (p. 417), **ac-**
`tivemq::commands::ActiveMQTempTopic` (p. 434), and **ac-**
`tivemq::commands::ActiveMQTopic` (p. 466).

Referenced by `activemq::commands::ActiveMQTempDestination::copyDataStructure()`.

6.24.2.3 `static Pointer<ActiveMQDestination> ac-`
`tivemq::commands::ActiveMQDestination::createDestination (int type,`
`const std::string & name) [static]`

Creates a Destination given the String Name to use and a Type.

Parameters:

type - The Type of Destination to Create

name - The Name to use in the creation of the Destination

Returns:

Pointer to a new `ActiveMQDestination` (p. 229) instance.

6.24.2.4 `static std::string ac-`
`tivemq::commands::ActiveMQDestination::createTemporaryName (const`
`std::string & clientId) [inline, static]`

Create a temporary name from the clientId.

Parameters:

clientId

Returns:

6.24.2.5 virtual bool activemq::commands::ActiveMQDestination::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 339),
activemq::commands::ActiveMQTempDestination (p. 401), **ac-**
tivemq::commands::ActiveMQTempQueue (p. 417), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 434), and **ac-**
tivemq::commands::ActiveMQTopic (p. 467).

Referenced by **activemq::commands::ActiveMQTopic::equals()**, and **ac-**
tivemq::commands::ActiveMQTempDestination::equals().

6.24.2.6 static std::string activemq::commands::ActiveMQDestination::getClientId (const ActiveMQDestination * *destination*) [static]

From a temporary destination find the clientId of the Connection that created it.

Parameters:

destination

Returns:

the clientId or null if not a temporary destination

6.24.2.7 virtual const cms::Destination* activemq::commands::ActiveMQDestination::getCMSDestination () const [inline, virtual]

Returns:

the **cms::Destination** (p. 1190) interface pointer that the objects that derive from this class implement.

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 339),
activemq::commands::ActiveMQTempQueue (p. 417), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 434), and **ac-**
tivemq::commands::ActiveMQTopic (p. 467).

6.24.2.8 virtual unsigned char activemq::commands::ActiveMQDestination::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1176).

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 339),
activemq::commands::ActiveMQTempDestination (p. 401), **ac-**
tivemq::commands::ActiveMQTempQueue (p. 418), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 435), and **ac-**
tivemq::commands::ActiveMQTopic (p. 467).

6.24.2.9 **virtual cms::Destination::DestinationType ac-**
tivemq::commands::ActiveMQDestination::getDestinationType () const
[pure virtual]

Returns the Type of Destination that this object represents.

Returns:

int type qualifier.

Implemented in **activemq::commands::ActiveMQQueue** (p. 339),
activemq::commands::ActiveMQTempQueue (p. 418), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 435), and **ac-**
tivemq::commands::ActiveMQTopic (p. 467).

6.24.2.10 **const activemq::util::ActiveMQProperties& ac-**
tivemq::commands::ActiveMQDestination::getOptions () const
[inline]

Returns:

a reference (const) to the options properties for this Destination.

6.24.2.11 **virtual std::string ac-**
tivemq::commands::ActiveMQDestination::getOrderedTarget () const
[inline, virtual]

Returns:

Returns the orderedTarget.

6.24.2.12 **virtual std::string& ac-**
tivemq::commands::ActiveMQDestination::getPhysicalName () [inline,
virtual]

6.24.2.13 **virtual const std::string& ac-**
tivemq::commands::ActiveMQDestination::getPhysicalName () const
[inline, virtual]

Fetch this destination's physical name.

Returns:

const string containing the name

6.24.2.14 `virtual bool activemq::commands::ActiveMQDestination::isAdvisory () const [inline, virtual]`

Returns:

Returns the advisory.

6.24.2.15 `virtual bool activemq::commands::ActiveMQDestination::isComposite () const [inline, virtual]`

Returns true if this destination represents a collection of destinations; allowing a set of destinations to be published to or subscribed from in one CMS operation.

Returns:

true if this destination represents a collection of child destinations.

6.24.2.16 `virtual bool activemq::commands::ActiveMQDestination::isConnectionAdvisory () const [inline, virtual]`

Returns:

true if this is a destination for Connection advisories

6.24.2.17 `virtual bool activemq::commands::ActiveMQDestination::isConsumerAdvisory () const [inline, virtual]`

Returns:

true if this is a destination for Consumer advisories

6.24.2.18 `virtual bool activemq::commands::ActiveMQDestination::isExclusive () const [inline, virtual]`

Returns:

Returns the exclusive.

6.24.2.19 `virtual bool activemq::commands::ActiveMQDestination::isOrdered () const [inline, virtual]`

Returns:

Returns the ordered.

6.24.2.20 `virtual bool activemq::commands::ActiveMQDestination::isProducerAdvisory () const`
[inline, virtual]

Returns:

true if this is a destination for Producer advisories

6.24.2.21 `virtual bool activemq::commands::ActiveMQDestination::isQueue ()`
`const` [inline, virtual]

Returns true if a Queue Destination.

Returns:

true/false

6.24.2.22 `virtual bool activemq::commands::ActiveMQDestination::isTemporary ()`
`const` [inline, virtual]

Returns true if a temporary Destination.

Returns:

true/false

References `cms::Destination::TEMPORARY_QUEUE`, and `cms::Destination::TEMPORARY_TOPIC`.

6.24.2.23 `virtual bool activemq::commands::ActiveMQDestination::isTopic () const`
[inline, virtual]

Returns true if a Topic Destination.

Returns:

true/false

References `cms::Destination::TEMPORARY_TOPIC`, and `cms::Destination::TOPIC`.

6.24.2.24 `virtual bool activemq::commands::ActiveMQDestination::isWildcard ()`
`const` [inline, virtual]

Returns:

true if the destination matches multiple possible destinations

6.24.2.25 `virtual void activemq::commands::ActiveMQDestination::setAdvisory`
`(bool advisory)` [inline, virtual]

Parameters:

advisory The advisory to set.

6.24.2.26 virtual void activemq::commands::ActiveMQDestination::setExclusive (bool *exclusive*) [inline, virtual]

Parameters:

exclusive The exclusive to set.

6.24.2.27 virtual void activemq::commands::ActiveMQDestination::setOrdered (bool *ordered*) [inline, virtual]

Parameters:

ordered The ordered to set.

6.24.2.28 virtual void activemq::commands::ActiveMQDestination::setOrderedTarget (const std::string & *orderedTarget*) [inline, virtual]

Parameters:

orderedTarget The orderedTarget to set.

6.24.2.29 virtual void activemq::commands::ActiveMQDestination::setPhysicalName (const std::string & *physicalName*) [virtual]

Set this destination's physical name.

Returns:

const string containing the name

6.24.2.30 virtual std::string activemq::commands::ActiveMQDestination::toString () const [virtual]

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 560).

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 340), **activemq::commands::ActiveMQTempDestination** (p. 401), **activemq::commands::ActiveMQTempQueue** (p. 418), **activemq::commands::ActiveMQTempTopic** (p. 435), and **activemq::commands::ActiveMQTopic** (p. 468).

6.24.3 Field Documentation

6.24.3.1 `bool activemq::commands::ActiveMQDestination::advisory` [protected]

6.24.3.2 `const std::string
activemq::commands::ActiveMQDestination::ADVISORY_
PREFIX` [static, protected]

prefix for Advisory message destinations

6.24.3.3 `const std::string
activemq::commands::ActiveMQDestination::COMPOSITE_
SEPARATOR` [static, protected]

6.24.3.4 `const std::string
activemq::commands::ActiveMQDestination::CONNECTION_
ADVISORY_PREFIX` [static, protected]

prefix for connection advisory destinations

6.24.3.5 `const std::string
activemq::commands::ActiveMQDestination::CONSUMER_
ADVISORY_PREFIX` [static, protected]

prefix for consumer advisory destinations

6.24.3.6 `const std::string
activemq::commands::ActiveMQDestination::DEFAULT_
ORDERED_TARGET` [static, protected]

The default target for ordered destinations.

6.24.3.7 `bool activemq::commands::ActiveMQDestination::exclusive` [protected]

6.24.3.8 `const unsigned char activemq::commands::ActiveMQDestination::ID _ - ACTIVEMQDESTINATION = 0` [static]

6.24.3.9 `util::ActiveMQProperties activemq::commands::ActiveMQDestination::options` [protected]

6.24.3.10 `bool activemq::commands::ActiveMQDestination::ordered` [protected]

6.24.3.11 `std::string activemq::commands::ActiveMQDestination::orderedTarget` [protected]

6.24.3.12 `std::string activemq::commands::ActiveMQDestination::physicalName` [protected]

6.24.3.13 `const std::string activemq::commands::ActiveMQDestination::PRODUCER _ - ADVISORY _ PREFIX` [static, protected]

prefix for producer advisory destinations

6.24.3.14 `const std::string activemq::commands::ActiveMQDestination::QUEUE _ - QUALIFIED _ PREFIX` [static, protected]

6.24.3.15 `const std::string activemq::commands::ActiveMQDestination::TEMP _ - POSTFIX` [static, protected]

6.24.3.16 `const std::string activemq::commands::ActiveMQDestination::TEMP _ - PREFIX` [static, protected]

6.24.3.17 `const std::string activemq::commands::ActiveMQDestination::TEMP _ - QUEUE _ QUALIFIED _ PREFIX` [static, protected]

6.24.3.18 `const std::string activemq::commands::ActiveMQDestination::TEMP _ - TOPIC _ QUALIFIED _ PREFIX` [static, protected]

6.24.3.19 `const std::string activemq::commands::ActiveMQDestination::TOPIC _ - QUALIFIED _ PREFIX` [static, protected]

Write a object instance to data output stream.

6.25.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQDestinationMarshaller** (p. 240).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.25.2 Constructor & Destructor Documentation

6.25.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller::ActiveMQDestinationMarshaller()` `[inline]`

6.25.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller::~~ActiveMQDestinationMarshaller()` `[inline, virtual]`

6.25.3 Member Function Documentation

6.25.3.1 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller` (p. 342), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller` (p. 404), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller` (p. 421), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller` (p. 438), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller` (p. 470).

6.25.3.2 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` `[virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataIn* - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller` (p. 343), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller` (p. 404), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller` (p. 422), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller` (p. 439), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller` (p. 471).

6.25.3.3 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller` (p. 343), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller` (p. 405), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller` (p. 422), `activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller` (p. 439), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller` (p. 471).

6.25.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller** (p. 344), **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 405), **activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller** (p. 423), **activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller** (p. 440), and **activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller** (p. 472).

6.25.3.5 virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller** (p. 344), **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 406), **activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller** (p. 423), **activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller** (p. 440), and **activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller** (p. 472).

The documentation for this class was generated from the following file:

6.26.3 Member Function Documentation

6.26.3.1 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 346), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 408), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 425), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 442), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 474).

6.26.3.2 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 347), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 408), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 426), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 443), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 475).

6.26.3.3 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 347), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 409), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 426), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 443), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 475).

6.26.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 348), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 409), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 427), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 444), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 476).

6.26.3.5 virtual void **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller::tightUnmarshal** (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

- wireFormat*** - describes the wire format of the broker.
- dataStructure*** - Object to be un-marshaled.
- dataIn*** - BinaryReader that provides that data.
- bs*** - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 348), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 410), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 427), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 444), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 476).

6.27.3 Member Function Documentation

6.27.3.1 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller` (p. 350), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 412), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller` (p. 429), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller` (p. 446), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller` (p. 478).

6.27.3.2 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` `[virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataIn* - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller` (p. 351), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 412), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller` (p. 430), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller` (p. 447), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller` (p. 479).

tivemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller::tightMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller` (p. 351), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 413), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller` (p. 430), `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller` (p. 447), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller` (p. 479).

```
6.27.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller::tightMarshal2
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller** (p. 352), **activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller** (p. 413), **activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller** (p. 431), **activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller** (p. 448), and **activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller** (p. 480).

6.27.3.5 virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller** (p. 352), **activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller** (p. 414), **activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller** (p. 431), **activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller** (p. 448), and **activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller** (p. 480).

6.28.1.1 activemq::exceptions::ActiveMQException::ActiveMQException () throw ()

Default Constructor.

6.28.1.2 activemq::exceptions::ActiveMQException::ActiveMQException (const ActiveMQException & ex) throw ()

Copy Constructor.

Parameters:

ex The Exception whose internal data is copied into this instance.

6.28.1.3 `activemq::exceptions::ActiveMQException::ActiveMQException (const decaf::lang::Exception & ex) throw ()`

Copy Constructor.

Parameters:

ex The Exception whose internal data is copied into this instance.

6.28.1.4 `activemq::exceptions::ActiveMQException::ActiveMQException (const char * file, const int lineNumber, const char * msg, ...) throw ()`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message.

Parameters:

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

msg The message to report.

... The list of primitives that are formatted into the message.

6.28.1.5 `virtual activemq::exceptions::ActiveMQException::~~ActiveMQException () throw () [virtual]`

6.28.2 Member Function Documentation

6.28.2.1 `virtual ActiveMQException* activemq::exceptions::ActiveMQException::clone () const [virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this Exception object

Reimplemented from `decaf::lang::Exception` (p. 1271).

Reimplemented in `activemq::exceptions::BrokerException` (p. 590).

6.28.2.2 `virtual cms::CMSEException activemq::exceptions::ActiveMQException::convertToCMSEException () const [virtual]`

Converts this exception to a new CMSEException.

Returns:

a CMSEException with the data from this exception

The documentation for this class was generated from the following file:

- `src/main/activemq/exceptions/ActiveMQException.h`

6.29 activemq::commands::ActiveMQMapMessage Class Reference

#include <src/main/activemq/commands/ActiveMQMapMessage.h> Inheritance diagram for activemq::commands::ActiveMQMapMessage:

Public Member Functions

- **ActiveMQMapMessage** ()
- virtual **~ActiveMQMapMessage** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual bool **isMarshalAware** () const
Determine if this object is aware of marshaling and should have its before and after marshaling methods called.
- virtual **ActiveMQMapMessage** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat) throw (decaf::io::IOException)
Perform any processing needed before an marshal.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual **cms::MapMessage** * **clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual std::vector< std::string > **getMapNames** () const throw (cms::CMSException)
Returns an Enumeration of all the names in the MapMessage object.
- virtual bool **itemExists** (const std::string &name) const throw (cms::CMSException)
Indicates whether an item exists in this MapMessage object.
- virtual bool **getBoolean** (const std::string &name) const throw (cms::CMSException)
Returns the Boolean value of the Specified name.

- virtual void **setBoolean** (const std::string &name, bool value) throw (cms::CMSEException)
Sets a boolean value with the specified name into the Map.
- virtual unsigned char **getByte** (const std::string &name) const throw (cms::CMSEException)
Returns the Byte value of the Specified name.
- virtual void **setByte** (const std::string &name, unsigned char value) throw (cms::CMSEException)
Sets a Byte value with the specified name into the Map.
- virtual std::vector< unsigned char > **getBytes** (const std::string &name) const throw (cms::CMSEException)
Returns the Bytes value of the Specified name.
- virtual void **setBytes** (const std::string &name, const std::vector< unsigned char > &value) throw (cms::CMSEException)
Sets a Bytes value with the specified name into the Map.
- virtual char **getChar** (const std::string &name) const throw (cms::CMSEException)
Returns the Char value of the Specified name.
- virtual void **setChar** (const std::string &name, char value) throw (cms::CMSEException)
Sets a Char value with the specified name into the Map.
- virtual double **getDouble** (const std::string &name) const throw (cms::CMSEException)
Returns the Double value of the Specified name.
- virtual void **setDouble** (const std::string &name, double value) throw (cms::CMSEException)
Sets a Double value with the specified name into the Map.
- virtual float **getFloat** (const std::string &name) const throw (cms::CMSEException)
Returns the Float value of the Specified name.
- virtual void **setFloat** (const std::string &name, float value) throw (cms::CMSEException)
Sets a Float value with the specified name into the Map.
- virtual int **getInt** (const std::string &name) const throw (cms::CMSEException)
Returns the Int value of the Specified name.
- virtual void **setInt** (const std::string &name, int value) throw (cms::CMSEException)
Sets a Int value with the specified name into the Map.
- virtual long long **getLong** (const std::string &name) const throw (cms::CMSEException)
Returns the Long value of the Specified name.
- virtual void **setLong** (const std::string &name, long long value) throw (cms::CMSEException)

Sets a Long value with the specified name into the Map.

- virtual short **getShort** (const std::string &name) const throw (cms::CMSEException)
Returns the Short value of the Specified name.
- virtual void **setShort** (const std::string &name, short value) throw (cms::CMSEException)
Sets a Short value with the specified name into the Map.
- virtual std::string **getString** (const std::string &name) const throw (cms::CMSEException)
Returns the String value of the Specified name.
- virtual void **setString** (const std::string &name, const std::string &value) throw (cms::CMSEException)
Sets a String value with the specified name into the Map.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQMAPMESSAGE** = 25

Protected Member Functions

- **util::PrimitiveMap & getMap** () throw (decaf::lang::exceptions::NullPointerException)
Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.
- const **util::PrimitiveMap & getMap** () const throw (decaf::lang::exceptions::NullPointerException)
- virtual void **checkMapIsUnmarshalled** () const throw (decaf::lang::exceptions::NullPointerException)
Performs the unmarshal on the Map if needed, otherwise just returns.

6.29.1 Constructor & Destructor Documentation

6.29.1.1 `activemq::commands::ActiveMQMapMessage::ActiveMQMapMessage ()`

6.29.1.2 `virtual activemq::commands::ActiveMQMapMessage::~~ActiveMQMapMessage () [virtual]`

6.29.2 Member Function Documentation

6.29.2.1 `virtual void activemq::commands::ActiveMQMapMessage::beforeMarshal (wireformat::WireFormat * wireFormat) throw (decaf::io::IOException) [virtual]`

Perform any processing needed before an marshal.

Parameters:

wireFormat - the OpenWireFormat object in use.

Implements **activemq::wireformat::MarshalAware** (p. 1713).

6.29.2.2 `virtual void activemq::commands::ActiveMQMapMessage::checkMapIsUnmarshalled () const throw (decaf::lang::exceptions::NullPointerException)` [protected, virtual]

Performs the unmarshal on the Map if needed, otherwise just returns.

6.29.2.3 `virtual cms::MapMessage* activemq::commands::ActiveMQMapMessage::clone () const` [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p. 1758).

6.29.2.4 `virtual ActiveMQMapMessage* activemq::commands::ActiveMQMapMessage::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1741).

6.29.2.5 `virtual void activemq::commands::ActiveMQMapMessage::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1742).

6.29.2.6 virtual bool activemq::commands::ActiveMQMapMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Message** (p. 1742).

6.29.2.7 virtual bool activemq::commands::ActiveMQMapMessage::getBoolean (const std::string & *name*) const throw (cms::CMSEException) [virtual]

Returns the Boolean value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1703).

6.29.2.8 virtual unsigned char activemq::commands::ActiveMQMapMessage::getBytes (const std::string & *name*) const throw (cms::CMSEException) [virtual]

Returns the Byte value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1703).

6.29.2.9 virtual std::vector<unsigned char> activemq::commands::ActiveMQMapMessage::getBytes (const std::string & *name*) const throw (cms::CMSEException) [virtual]

Returns the Bytes value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1704).

6.29.2.10 `virtual char activemq::commands::ActiveMQMapMessage::getChar
(const std::string & name) const throw (cms::CMSEException)
[virtual]`

Returns the Char value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1704).

6.29.2.11 `virtual unsigned char ac-
tivismq::commands::ActiveMQMapMessage::getDataStructureType ()
const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Reimplemented from **activemq::commands::Message** (p. 1743).

6.29.2.12 `virtual double activemq::commands::ActiveMQMapMessage::getDouble
(const std::string & name) const throw (cms::CMSEException)
[virtual]`

Returns the Double value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1704).

6.29.2.13 `virtual float activemq::commands::ActiveMQMapMessage::getFloat
(const std::string & name) const throw (cms::CMSEException)
[virtual]`

Returns the Float value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1705).

6.29.2.14 `virtual int activemq::commands::ActiveMQMapMessage::getInt (const std::string & name) const throw (cms::CMSEException) [virtual]`

Returns the Int value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1705).

6.29.2.15 `virtual long long activemq::commands::ActiveMQMapMessage::getLong (const std::string & name) const throw (cms::CMSEException) [virtual]`

Returns the Long value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1705).

6.29.2.16 `const util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap () const throw (decaf::lang::exceptions::NullPointerException) [protected]`

6.29.2.17 `util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap () throw (decaf::lang::exceptions::NullPointerException) [protected]`

Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.

Returns:

reference to a PrimitiveMap.

6.29.2.18 `virtual std::vector<std::string> activemq::commands::ActiveMQMapMessage::getMapNames
() const throw (cms::CMSEException) [virtual]`

Returns an Enumeration of all the names in the MapMessage object.

Returns:

STL Vector of String values, each of which is the name of an item in the MapMessage

Exceptions:

CMSEException

Implements **cms::MapMessage** (p.1705).

6.29.2.19 `virtual short activemq::commands::ActiveMQMapMessage::getShort
(const std::string & name) const throw (cms::CMSEException)
[virtual]`

Returns the Short value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p.1706).

6.29.2.20 `virtual std::string ac-
tivemq::commands::ActiveMQMapMessage::getString
(const std::string & name) const throw (cms::CMSEException)
[virtual]`

Returns the String value of the Specified name.

Parameters:

name of the value to fetch from the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p.1706).

6.29.2.21 `virtual bool ac-
tivemq::commands::ActiveMQMapMessage::isMarshalAware () const
[inline, virtual]`

Determine if this object is aware of marshaling and should have its before and after marshaling methods called. Defaults to false.

Returns:

true if aware of marshaling

Reimplemented from **activemq::commands::Message** (p. 1746).

6.29.2.22 **virtual bool activemq::commands::ActiveMQMapMessage::itemExists**
(const std::string & *name*) const throw (cms::CMSEException)
[virtual]

Indicates whether an item exists in this MapMessage object.

Parameters:

name - String name of the Object in question

Returns:

boolean value indicating if the name is in the map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1706).

6.29.2.23 **virtual void activemq::commands::ActiveMQMapMessage::setBoolean**
(const std::string & *name*, bool *value*) throw (cms::CMSEException)
[virtual]

Sets a boolean value with the specified name into the Map.

Parameters:

name - the name of the boolean

value - the boolean value to set in the Map

Exceptions:

CMSEException

Implements **cms::MapMessage** (p. 1707).

6.29.2.24 **virtual void activemq::commands::ActiveMQMapMessage::setByte** (const
std::string & *name*, unsigned char *value*) throw (cms::CMSEException)
[virtual]

Sets a Byte value with the specified name into the Map.

Parameters:

name - the name of the Byte

value - the Byte value to set in the Map

Exceptions:

CMSException

Implements **cms::MapMessage** (p. 1707).

6.29.2.25 `virtual void activemq::commands::ActiveMQMapMessage::setBytes
(const std::string & name, const std::vector< unsigned char > & value)
throw (cms::CMSException) [virtual]`

Sets a Bytes value with the specified name into the Map.

Parameters:

name - the name of the Bytes

value - the Bytes value to set in the Map

Exceptions:

CMSException

Implements **cms::MapMessage** (p. 1707).

6.29.2.26 `virtual void activemq::commands::ActiveMQMapMessage::setChar (const
std::string & name, char value) throw (cms::CMSException) [virtual]`

Sets a Char value with the specified name into the Map.

Parameters:

name - the name of the Char

value - the Char value to set in the Map

Exceptions:

CMSException

Implements **cms::MapMessage** (p. 1708).

6.29.2.27 `virtual void activemq::commands::ActiveMQMapMessage::setDouble
(const std::string & name, double value) throw (cms::CMSException)
[virtual]`

Sets a Double value with the specified name into the Map.

Parameters:

name - the name of the Double

value - the Double value to set in the Map

Exceptions:

CMSException

Implements **cms::MapMessage** (p. 1708).

6.29.2.28 `virtual void activemq::commands::ActiveMQMapMessage::setFloat (const std::string & name, float value) throw (cms::CMSException) [virtual]`

Sets a Float value with the specified name into the Map.

Parameters:

name - the name of the Float

value - the Float value to set in the Map

Exceptions:

CMSException

Implements `cms::MapMessage` (p.1708).

6.29.2.29 `virtual void activemq::commands::ActiveMQMapMessage::setInt (const std::string & name, int value) throw (cms::CMSException) [virtual]`

Sets a Int value with the specified name into the Map.

Parameters:

name - the name of the Int

value - the Int value to set in the Map

Exceptions:

CMSException

Implements `cms::MapMessage` (p.1709).

6.29.2.30 `virtual void activemq::commands::ActiveMQMapMessage::setLong (const std::string & name, long long value) throw (cms::CMSException) [virtual]`

Sets a Long value with the specified name into the Map.

Parameters:

name - the name of the Long

value - the Long value to set in the Map

Exceptions:

CMSException

Implements `cms::MapMessage` (p.1709).

6.29.2.31 `virtual void activemq::commands::ActiveMQMapMessage::setShort (const std::string & name, short value) throw (cms::CMSException) [virtual]`

Sets a Short value with the specified name into the Map.

Parameters:

name - the name of the Short
value - the Short value to set in the Map

Exceptions:

CMSException

Implements `cms::MapMessage` (p.1709).

6.29.2.32 `virtual void activemq::commands::ActiveMQMapMessage::setString (const std::string & name, const std::string & value) throw (cms::CMSException) [virtual]`

Sets a String value with the specified name into the Map.

Parameters:

name - the name of the String
value - the String value to set in the Map

Exceptions:

CMSException

Implements `cms::MapMessage` (p.1710).

6.29.2.33 `virtual std::string activemq::commands::ActiveMQMapMessage::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::Message` (p.1749).

6.29.3 Field Documentation

6.29.3.1 `const unsigned char activemq::commands::ActiveMQMapMessage::ID_ - ACTIVEMQMAPMESSAGE = 25 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ActiveMQMapMessage.h`

6.30 activemq:wireformat::openwire::marshal:v3::ActiveMQMapMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 267).

#include <src/main/activemq/wireformat/openwire/marshal/v3/ActiveMQMapMessageMarshaller.h> Inheritance diagram for activemq:wireformat::openwire::marshal:v3::ActiveMQMapMessageMarshaller:

Public Member Functions

- **ActiveMQMapMessageMarshaller** ()
- virtual **~ActiveMQMapMessageMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.30.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 267).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.30.2 Constructor & Destructor Documentation

6.30.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::ActiveMQMapMessageMarshaller()` [inline]

6.30.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::~~ActiveMQMapMessageMarshaller()` [inline, virtual]

6.30.3 Member Function Documentation

6.30.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::createObject(const commands::DataStructure& dataStructure) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.30.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.30.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::looseMarshal(const OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.30.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.30.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1868).

6.30.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

6.30.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ActiveMQMapMessageMarshaller.h`

6.31 activemq:wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 271).

6.31.3 Member Function Documentation

6.31.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.31.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.31.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller::looseMarshal(commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.31.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.31.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1873).

6.31.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.31.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

The documentation for this class was generated from the following file:

6.32.2 Constructor & Destructor Documentation

6.32.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::ActiveMQMapMessageMarshaller()` [inline]

6.32.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::~~ActiveMQMapMessageMarshaller()` [inline, virtual]

6.32.3 Member Function Documentation

6.32.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::createObject(const commands::DataStructure& dataStructure) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.32.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.32.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::looseMarshal(const commands::DataStructure& dataStructure, decaf::io::DataOutputStream& dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.32.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.32.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1863).

6.32.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

6.32.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

6.33 activemq::commands::ActiveMQMessage Class Reference

#include <src/main/activemq/commands/ActiveMQMessage.h> Inheritance diagram for activemq::commands::ActiveMQMessage:

Public Member Functions

- **ActiveMQMessage** ()
- virtual **~ActiveMQMessage** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual **ActiveMQMessage** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message** * **clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQMESSAGE** = 23

6.33.1 Constructor & Destructor Documentation

6.33.1.1 **activemq::commands::ActiveMQMessage::ActiveMQMessage** ()

6.33.1.2 **virtual activemq::commands::ActiveMQMessage::~~ActiveMQMessage** ()
[inline, virtual]

6.33.2 Member Function Documentation

6.33.2.1 **virtual cms::Message* activemq::commands::ActiveMQMessage::clone** ()
const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p.1758).

6.33.2.2 **virtual ActiveMQMessage* activemq::commands::ActiveMQMessage::cloneDataStructure () const** [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p.1741).

6.33.2.3 **virtual void activemq::commands::ActiveMQMessage::copyDataStructure (const DataStructure * src)** [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::Message** (p.1742).

6.33.2.4 **virtual bool activemq::commands::ActiveMQMessage::equals (const DataStructure * value) const** [virtual]

Compares the **DataStructure** (p.1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Message** (p.1742).

6.33.2.5 **virtual unsigned char activemq::commands::ActiveMQMessage::getDataStructureType () const** [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p.1174) type copy.

Reimplemented from **activemq::commands::Message** (p.1743).

6.33.2.6 virtual std::string activemq::commands::ActiveMQMessage::toString () const [virtual]

Returns a string containing the information for this **DataSet** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p.1749).

6.33.3 Field Documentation

6.33.3.1 const unsigned char activemq::commands::ActiveMQMessage::ID_ - ACTIVEMQMESSAGE = 23 [static]

Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.34.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQMessageMarshaller** (p. 282). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.34.2 Constructor & Destructor Documentation

6.34.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::ActiveMQMessageMarshaller()` [inline]

6.34.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::~~ActiveMQMessageMarshaller()` [inline, virtual]

6.34.3 Member Function Documentation

6.34.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.34.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.34.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.34.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.34.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1868).

6.34.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

6.34.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

The documentation for this class was generated from the following file:

6.35.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQMessageMarshaller** (p. 286). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.35.2 Constructor & Destructor Documentation

6.35.2.1 `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::ActiveMQMessageMarshaller()` `[inline]`

6.35.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::~~ActiveMQMessageMarshaller()` `[inline, virtual]`

6.35.3 Member Function Documentation

6.35.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.35.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.35.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.35.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.35.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1873).

6.35.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.35.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ActiveMQMessageMarshaller.h**

6.36 activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQMessageMarshaller** (p. 290).

#include <src/main/activemq/wireformat/openwire/marshal/v2/ActiveMQMessageMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller:

Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.36.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQMessageMarshaller** (p. 290). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.36.2 Constructor & Destructor Documentation

6.36.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::ActiveMQMessageMarshaller()` [inline]

6.36.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::~~ActiveMQMessageMarshaller()` [inline, virtual]

6.36.3 Member Function Documentation

6.36.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.36.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.36.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.36.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.36.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1863).

6.36.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

6.36.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ActiveMQMessageMarshaller.h`

Public Member Functions

- **ActiveMQMessageTemplate** ()
- virtual **~ActiveMQMessageTemplate** ()
- virtual void **acknowledge** () const throw (cms::CMSEException)
Acknowledges all consumed messages of the session of this consumed message.
- virtual void **clearBody** () throw (cms::CMSEException)
Clears out the body of the message.
- virtual void **clearProperties** () throw (cms::CMSEException)
Clears the message properties.
- virtual std::vector< std::string > **getPropertyNames** () const throw (cms::CMSEException)
Retrieves the property names.
- virtual bool **propertyExists** (const std::string &name) const throw (cms::CMSEException)
Indicates whether or not a given property exists.
- virtual bool **getBooleanProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a boolean property.
- virtual unsigned char **getByteProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a byte property.
- virtual double **getDoubleProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a double property.
- virtual float **getFloatProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a float property.
- virtual int **getIntProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a int property.

- virtual long long **getLongProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a long property.
- virtual short **getShortProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a short property.
- virtual std::string **getStringProperty** (const std::string &name) const throw (cms::CMSEException)
Gets a string property.
- virtual void **setBooleanProperty** (const std::string &name, bool value) throw (cms::CMSEException)
Sets a boolean property.
- virtual void **setByteProperty** (const std::string &name, unsigned char value) throw (cms::CMSEException)
Sets a byte property.
- virtual void **setDoubleProperty** (const std::string &name, double value) throw (cms::CMSEException)
Sets a double property.
- virtual void **setFloatProperty** (const std::string &name, float value) throw (cms::CMSEException)
Sets a float property.
- virtual void **setIntProperty** (const std::string &name, int value) throw (cms::CMSEException)
Sets a int property.
- virtual void **setLongProperty** (const std::string &name, long long value) throw (cms::CMSEException)
Sets a long property.
- virtual void **setShortProperty** (const std::string &name, short value) throw (cms::CMSEException)
Sets a short property.
- virtual void **setStringProperty** (const std::string &name, const std::string &value) throw (cms::CMSEException)
Sets a string property.
- virtual std::string **getCMSCorrelationID** () const throw (cms::CMSEException)
Get the Correlation Id for this message.
- virtual void **setCMSCorrelationID** (const std::string &correlationId) throw (cms::CMSEException)
Sets the Correlation Id used by this message.

- virtual int **getCMSDeliveryMode** () const throw (cms::CMSEException)
Gets the DeliveryMode for this message.
- virtual void **setCMSDeliveryMode** (int mode) throw (cms::CMSEException)
Sets the DeliveryMode for this message.
- virtual const cms::Destination * **getCMSDestination** () const throw (cms::CMSEException)
*Gets the Destination for this **Message** (p. 1737), returns a.*
- virtual void **setCMSDestination** (const cms::Destination *destination) throw (cms::CMSEException)
Sets the Destination for this message.
- virtual long long **getCMSExpiration** () const throw (cms::CMSEException)
*Gets the Expiration Time for this **Message** (p. 1737).*
- virtual void **setCMSExpiration** (long long expireTime) throw (cms::CMSEException)
Sets the Expiration Time for this message.
- virtual std::string **getCMSMessageID** () const throw (cms::CMSEException)
*Gets the CMS **Message** (p. 1737) Id for this **Message** (p. 1737).*
- virtual void **setCMSMessageID** (const std::string &id AMQCPP_UNUSED) throw (cms::CMSEException)
*Sets the CMS **Message** (p. 1737) Id for this message.*
- virtual int **getCMSPriority** () const throw (cms::CMSEException)
*Gets the Priority Value for this **Message** (p. 1737).*
- virtual void **setCMSPriority** (int priority) throw (cms::CMSEException)
Sets the Priority Value for this message.
- virtual bool **getCMSRedelivered** () const throw (cms::CMSEException)
*Gets the Redelivered Flag for this **Message** (p. 1737).*
- virtual void **setCMSRedelivered** (bool redelivered AMQCPP_UNUSED) throw (cms::CMSEException)
Sets the Redelivered Flag for this message.
- virtual const cms::Destination * **getCMSReplyTo** () const throw (cms::CMSEException)
*Gets the CMS Reply To Address for this **Message** (p. 1737).*
- virtual void **setCMSReplyTo** (const cms::Destination *destination) throw (cms::CMSEException)
Sets the CMS Reply To Address for this message.
- virtual long long **getCMSTimestamp** () const throw (cms::CMSEException)
*Gets the Time Stamp for this **Message** (p. 1737).*

- virtual void **setCMSTimestamp** (long long timeStamp) throw (cms::CMSEException)
Sets the Time Stamp for this message.
- virtual std::string **getCMSType** () const throw (cms::CMSEException)
*Gets the CMS **Message** (p. 1737) Type for this **Message** (p. 1737).*
- virtual void **setCMSType** (const std::string &type) throw (cms::CMSEException)
*Sets the CMS **Message** (p. 1737) Type for this message.*

template<typename T> class activemq::commands::ActiveMQMessageTemplate< T  
>
```

6.37.1 Constructor & Destructor Documentation

6.37.1.1 `template<typename T>
activemq::commands::ActiveMQMessageTemplate< T
>::ActiveMQMessageTemplate () [inline]`

6.37.1.2 `template<typename T> virtual
activemq::commands::ActiveMQMessageTemplate< T
>::~~ActiveMQMessageTemplate () [inline, virtual]`

6.37.2 Member Function Documentation

6.37.2.1 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::acknowledge () const throw (cms::CMSEException) [inline, virtual]`

Acknowledges all consumed messages of the session of this consumed message.

6.37.2.2 `template<typename T> void
activemq::commands::ActiveMQMessageTemplate< T
>::checkReadOnlyBody () [inline, protected]`

6.37.2.3 `template<typename T> void
activemq::commands::ActiveMQMessageTemplate< T
>::checkReadOnlyProperties () [inline, protected]`

6.37.2.4 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::clearBody () throw (cms::CMSEException) [inline, virtual]`

Clears out the body of the message. This does not clear the headers or properties.

Reimplemented in `activemq::commands::ActiveMQBytesMessage` (p.166), and `activemq::commands::ActiveMQStreamMessage` (p.376).

6.37.2.5 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::clearProperties () throw (cms::CMSException) [inline, virtual]`

Clears the message properties. Does not clear the body or header values.

6.37.2.6 `template<typename T> virtual bool
activemq::commands::ActiveMQMessageTemplate< T
>::getBooleanProperty (const std::string & name) const throw (cms::CMSException) [inline, virtual]`

Gets a boolean property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException if the property does not exist.

6.37.2.7 `template<typename T> virtual unsigned char
activemq::commands::ActiveMQMessageTemplate< T >::getByteProperty
(const std::string & name) const throw (cms::CMSException) [inline,
virtual]`

Gets a byte property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException if the property does not exist.

6.37.2.8 `template<typename T> virtual std::string
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSCorrelationID () const throw (cms::CMSException) [inline,
virtual]`

Get the Correlation Id for this message.

Returns:

string representation of the correlation Id

Exceptions:

CMSException

6.37.2.9 `template<typename T> virtual int
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSDeliveryMode () const throw (cms::CMSException) [inline,
virtual]`

Gets the DeliveryMode for this message.

Returns:

DeliveryMode enumerated value.

Exceptions:

CMSException

6.37.2.10 `template<typename T> virtual const cms::Destination*
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSDestination () const throw (cms::CMSException) [inline,
virtual]`

Gets the Destination for this **Message** (p. 1737), returns a.

Returns:

Destination object

Exceptions:

CMSException

6.37.2.11 `template<typename T> virtual long long
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSExpiration () const throw (cms::CMSException) [inline,
virtual]`

Gets the Expiration Time for this **Message** (p. 1737).

Returns:

time value

Exceptions:

CMSException

6.37.2.12 `template<typename T> virtual std::string
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSMessageID () const throw (cms::CMSException) [inline,
virtual]`

Gets the CMS Message (p.1737) Id for this Message (p.1737).

Returns:

time value

Exceptions:

CMSException

6.37.2.13 `template<typename T> virtual int
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSPriority () const throw (cms::CMSException) [inline,
virtual]`

Gets the Priority Value for this Message (p.1737).

Returns:

priority value

Exceptions:

CMSException

6.37.2.14 `template<typename T> virtual bool
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSRedelivered () const throw (cms::CMSException) [inline,
virtual]`

Gets the Redelivered Flag for this Message (p.1737).

Returns:

redelivered value

Exceptions:

CMSException

6.37.2.15 `template<typename T> virtual const cms::Destination*
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSReplyTo () const throw (cms::CMSException) [inline,
virtual]`

Gets the CMS Reply To Address for this Message (p.1737).

Returns:

Reply To Value

Exceptions:

CMSException

6.37.2.16 `template<typename T> virtual long long
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSTimestamp () const throw (cms::CMSException) [inline,
virtual]`

Gets the Time Stamp for this Message (p. 1737).

Returns:

time stamp value

Exceptions:

CMSException

6.37.2.17 `template<typename T> virtual std::string
activemq::commands::ActiveMQMessageTemplate< T
>::getCMSType () const throw (cms::CMSException) [inline,
virtual]`

Gets the CMS Message (p. 1737) Type for this Message (p. 1737).

Returns:

type value

Exceptions:

CMSException

6.37.2.18 `template<typename T> virtual double
activemq::commands::ActiveMQMessageTemplate< T
>::getDoubleProperty (const std::string & name) const throw (cms::CMSException) [inline, virtual]`

Gets a double property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException if the property does not exist.

6.37.2.19 `template<typename T> virtual float
activemq::commands::ActiveMQMessageTemplate< T
>::getFloatProperty (const std::string & name) const throw (
cms::CMSEException) [inline, virtual]`

Gets a float property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.37.2.20 `template<typename T> virtual int
activemq::commands::ActiveMQMessageTemplate< T
>::getIntProperty (const std::string & name) const throw (
cms::CMSEException) [inline, virtual]`

Gets a int property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

6.37.2.21 `template<typename T> virtual long long
activemq::commands::ActiveMQMessageTemplate< T
>::getLongProperty (const std::string & name) const throw (
cms::CMSEException) [inline, virtual]`

Gets a long property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

```
6.37.2.22  template<typename T> virtual std::vector<std::string>
           activemq::commands::ActiveMQMessageTemplate< T
           >::getPropertyNames () const throw ( cms::CMSEException ) [inline,
           virtual]
```

Retrieves the property names.

Returns:

The complete set of property names currently in this message.

```
6.37.2.23  template<typename T> virtual short
           activemq::commands::ActiveMQMessageTemplate< T
           >::getShortProperty (const std::string & name) const throw (
           cms::CMSEException ) [inline, virtual]
```

Gets a short property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

```
6.37.2.24  template<typename T> virtual std::string
           activemq::commands::ActiveMQMessageTemplate< T
           >::getStringProperty (const std::string & name) const throw (
           cms::CMSEException ) [inline, virtual]
```

Gets a string property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSEException if the property does not exist.

```
6.37.2.25  template<typename T> virtual bool
           activemq::commands::ActiveMQMessageTemplate< T
           >::propertyExists (const std::string & name) const throw (
           cms::CMSEException ) [inline, virtual]
```

Indicates whether or not a given property exists.

Parameters:

name The name of the property to look up.

Returns:

True if the property exists in this message.

6.37.2.26 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::setBooleanProperty (const std::string & name, bool value) throw (
cms::CMSException) [inline, virtual]`

Sets a boolean property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.37.2.27 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::setByteProperty (const std::string & name, unsigned char value)
throw (cms::CMSException) [inline, virtual]`

Sets a byte property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.37.2.28 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::setCMSCorrelationID (const std::string & correlationId) throw (
cms::CMSException) [inline, virtual]`

Sets the Correlation Id used by this message.

Parameters:

correlationId - String representing the correlation id.

Exceptions:

CMSException

```
6.37.2.29  template<typename T> virtual void
           activemq::commands::ActiveMQMessageTemplate< T
           >::setCMSDeliveryMode (int mode) throw ( cms::CMSException )
           [inline, virtual]
```

Sets the DeliveryMode for this message.

Parameters:

mode - DeliveryMode enumerated value.

Exceptions:

CMSException

```
6.37.2.30  template<typename T> virtual void
           activemq::commands::ActiveMQMessageTemplate< T
           >::setCMSDestination (const cms::Destination * destination) throw (
           cms::CMSException ) [inline, virtual]
```

Sets the Destination for this message.

Parameters:

destination - Destination Object

Exceptions:

CMSException

```
6.37.2.31  template<typename T> virtual void
           activemq::commands::ActiveMQMessageTemplate< T
           >::setCMSExpiration (long long expireTime) throw (
           cms::CMSException ) [inline, virtual]
```

Sets the Expiration Time for this message.

Parameters:

expireTime - time value

Exceptions:

CMSException

```
6.37.2.32  template<typename T> virtual void
           activemq::commands::ActiveMQMessageTemplate< T
           >::setCMSMessageID (const std::string &id AMQCPP_UNUSED)
           throw ( cms::CMSException ) [inline, virtual]
```

Sets the CMS Message (p. 1737) Id for this message.

Parameters:

id - time value

Exceptions:

CMSException

```
6.37.2.33  template<typename T> virtual void
             activemq::commands::ActiveMQMessageTemplate< T
             >::setCMSPriority (int priority) throw ( cms::CMSException ) [inline,
             virtual]
```

Sets the Priority Value for this message.

Parameters:

priority - priority value for this message

Exceptions:

CMSException

```
6.37.2.34  template<typename T> virtual void
             activemq::commands::ActiveMQMessageTemplate< T
             >::setCMSRedelivered (bool redelivered AMQCPP_UNUSED) throw (
             cms::CMSException ) [inline, virtual]
```

Sets the Redelivered Flag for this message.

Parameters:

redelivered - boolean redelivered value

Exceptions:

CMSException

```
6.37.2.35  template<typename T> virtual void
             activemq::commands::ActiveMQMessageTemplate< T
             >::setCMSReplyTo (const cms::Destination * destination) throw (
             cms::CMSException ) [inline, virtual]
```

Sets the CMS Reply To Address for this message.

Parameters:

destination Pointer to the CMS Destination that is the Reply-To value.

Exceptions:

CMSException

6.37.2.36 `template<typename T> virtual void
 activemq::commands::ActiveMQMessageTemplate< T
 >::setCMSTimestamp (long long timeStamp) throw (
 cms::CMSException) [inline, virtual]`

Sets the Time Stamp for this message.

Parameters:

timeStamp - integer time stamp value

Exceptions:

CMSException

6.37.2.37 `template<typename T> virtual void
 activemq::commands::ActiveMQMessageTemplate< T
 >::setCMSType (const std::string & type) throw (cms::CMSException)
 [inline, virtual]`

Sets the CMS **Message** (p.1737) Type for this message.

Parameters:

type - message type value string

Exceptions:

CMSException

6.37.2.38 `template<typename T> virtual void
 activemq::commands::ActiveMQMessageTemplate< T
 >::setDoubleProperty (const std::string & name, double value) throw (
 cms::CMSException) [inline, virtual]`

Sets a double property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException

6.37.2.39 `template<typename T> virtual void
 activemq::commands::ActiveMQMessageTemplate< T
 >::setFloatProperty (const std::string & name, float value) throw (
 cms::CMSException) [inline, virtual]`

Sets a float property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException

6.37.2.40 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::setIntProperty (const std::string & name, int value) throw (
cms::CMSEException) [inline, virtual]`

Sets a int property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException

6.37.2.41 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::setLongProperty (const std::string & name, long long value) throw (
cms::CMSEException) [inline, virtual]`

Sets a long property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException

6.37.2.42 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::setShortProperty (const std::string & name, short value) throw (
cms::CMSEException) [inline, virtual]`

Sets a short property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException

6.37.2.43 `template<typename T> virtual void
activemq::commands::ActiveMQMessageTemplate< T
>::setStringProperty (const std::string & name, const std::string &
value) throw (cms::CMSEException) [inline, virtual]`

Sets a string property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSEException

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ActiveMQMessageTemplate.h`

6.38 activemq::commands::ActiveMQObjectMessage Class Reference

#include <src/main/activemq/commands/ActiveMQObjectMessage.h> Inheritance diagram for activemq::commands::ActiveMQObjectMessage:

Public Member Functions

- **ActiveMQObjectMessage** ()
- virtual **~ActiveMQObjectMessage** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **ActiveMQObjectMessage * cloneDataStructure** () const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*

- virtual **cms::Message * clone** () const

Clone this message exactly, returns a new instance that the caller is required to delete.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQOBJECTMESSAGE** = 26

6.38.1 Constructor & Destructor Documentation

6.38.1.1 `activemq::commands::ActiveMQObjectMessage::ActiveMQObjectMessage()`

6.38.1.2 `virtual activemq::commands::ActiveMQObjectMessage::~~ActiveMQObjectMessage()` [inline, virtual]

6.38.2 Member Function Documentation

6.38.2.1 `virtual cms::Message* activemq::commands::ActiveMQObjectMessage::clone()` const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements `cms::Message` (p.1758).

6.38.2.2 `virtual ActiveMQObjectMessage* activemq::commands::ActiveMQObjectMessage::cloneDataStructure()` const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::Message` (p.1741).

6.38.2.3 `virtual void activemq::commands::ActiveMQObjectMessage::copyDataStructure(const DataStructure * src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::Message` (p.1742).

6.38.2.4 `virtual bool activemq::commands::ActiveMQObjectMessage::equals(const DataStructure * value)` const [virtual]

Compares the `DataStructure` (p.1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::Message` (p. 1742).

6.38.2.5 `virtual unsigned char activemq::commands::ActiveMQObjectMessage::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new `DataStructure` (p. 1174) type copy.

Reimplemented from `activemq::commands::Message` (p. 1743).

6.38.2.6 `virtual std::string activemq::commands::ActiveMQObjectMessage::toString () const [virtual]`

Returns a string containing the information for this `DataStructure` (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::Message` (p. 1749).

6.38.3 Field Documentation

6.38.3.1 `const unsigned char activemq::commands::ActiveMQObjectMessage::ID__ - ACTIVEMQOBJECTMESSAGE = 26 [static]`

UML class diagram for `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller`:

Public Member Functions

- **ActiveMQObjectMessageMarshaller** ()
- virtual **~ActiveMQObjectMessageMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.39.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 313).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

6.39.2 Constructor & Destructor Documentation

6.39.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::ActiveMQObjectMessageMarshaller()` [inline]

6.39.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::~ActiveMQObjectMessageMarshaller()` [inline, virtual]

6.39.3 Member Function Documentation

6.39.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.39.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.39.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::marshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.39

activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller

Class Reference

315

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1867).

6.39.3.4 virtual void ac-

```
ativemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::looseUnmarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn) throw (
    decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1867).

6.39.3.5 virtual int ac-

```
ativemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::tightMarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1868).

6.39.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

6.39.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.40.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 317).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.40.2 Constructor & Destructor Documentation

6.40.2.1 `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::ActiveMQObjectMessageMarshaller()` [inline]

6.40.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::~ActiveMQObjectMessageMarshaller()` [inline, virtual]

6.40.3 Member Function Documentation

6.40.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.40.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.40.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::marshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.40

activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller

Class Reference

319

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1872).

6.40.3.4 virtual void ac-

```
ativemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::looseUnmarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn) throw (
    decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1872).

6.40.3.5 virtual int ac-

```
ativemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::tightMarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1873).

6.40.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.40.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.41.3 Member Function Documentation

6.41.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.41.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.41.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller::marshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.41

activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller

Class Reference

323

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1862).

6.41.3.4 virtual void ac-

```
ativemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller::looseUnmarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn) throw (
    decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1862).

6.41.3.5 virtual int ac-

```
ativemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller::tightMarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1863).

6.41.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

6.41.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ActiveMQObjectMessageMarshaller.h`

6.42 activemq::core::ActiveMQProducer Class Reference

#include <src/main/activemq/core/ActiveMQProducer.h> Inheritance diagram for activemq::core::ActiveMQProducer:

Public Member Functions

- **ActiveMQProducer** (const **Pointer**< **commands::ProducerInfo** > &producerInfo, const **Pointer**< **cms::Destination** > &destination, **ActiveMQSession** *session)
*Constructor, creates an instance of an **ActiveMQProducer** (p. 325).*
- virtual ~**ActiveMQProducer** ()
- virtual void **close** () throw (cms::CMSEException)
Closes the Consumer.
- virtual void **send** (cms::Message *message) throw (cms::CMSEException)
Sends the message to the default producer destination.
- virtual void **send** (cms::Message *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (const cms::Destination *destination, cms::Message *message) throw (cms::CMSEException)
Sends the message to the designated destination.
- virtual void **send** (const cms::Destination *destination, cms::Message *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **setDeliveryMode** (int mode) throw (cms::CMSEException)
Sets the delivery mode for this Producer.
- virtual int **getDeliveryMode** () const throw (cms::CMSEException)
Gets the delivery mode for this Producer.
- virtual void **setDisableMessageID** (bool value) throw (cms::CMSEException)
Sets if Message Ids are disabled for this Producer.
- virtual bool **getDisableMessageID** () const throw (cms::CMSEException)
Gets if Message Ids are disabled for this Producer.
- virtual void **setDisableMessageTimeStamp** (bool value) throw (cms::CMSEException)
Sets if Message Time Stamps are disabled for this Producer.
- virtual bool **getDisableMessageTimeStamp** () const throw (cms::CMSEException)

Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority) throw (cms::CMSEException)
Sets the Priority that this Producers sends messages at.
- virtual int **getPriority** () const throw (cms::CMSEException)
Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time) throw (cms::CMSEException)
Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () const throw (cms::CMSEException)
Gets the Time to Live that this producer sends messages with.
- virtual void **setSendTimeout** (long long time) throw (cms::CMSEException)
Sets the Send Timeout that this Producers sends messages with.
- virtual long long **getSendTimeout** () const throw (cms::CMSEException)
Gets the Send Timeout that this producer sends messages with.
- bool **isClosed** () const
- const **commands::ProducerInfo** & **getProducerInfo** () const
Retries this object ProducerInfo pointer.
- **commands::ProducerId** & **getProducerId** () const
Retries this object ProducerId or NULL if closed.
- virtual void **onProducerAck** (const **commands::ProducerAck** &ack)
Handles the work of Processing a ProducerAck Command from the Broker.

6.42.1 Constructor & Destructor Documentation

6.42.1.1 **activemq::core::ActiveMQProducer::ActiveMQProducer** (const **Pointer**< **commands::ProducerInfo** > & *producerInfo*, const **Pointer**< **cms::Destination** > & *destination*, **ActiveMQSession** * *session*)

Constructor, creates an instance of an **ActiveMQProducer** (p. 325).

Parameters:

producerInfo Pointer to a ProducerInfo command which identifies this producer.

destination The assigned Destination this Producer sends to, or null if not set. The Producer does not own the Pointer passed.

session The Session which is the parent of this Producer.

6.42.1.2 `virtual activemq::core::ActiveMQProducer::~~ActiveMQProducer ()`
[virtual]

6.42.2 Member Function Documentation

6.42.2.1 `virtual void activemq::core::ActiveMQProducer::close () throw (`
`cms::CMSEException)` [virtual]

Closes the Consumer. This will return all allocated resources and purge any outstanding messages. This method will block if there is a call to receive in progress, or a dispatch to a MessageListener in place

Exceptions:

CMSEException

Implements `cms::Closeable` (p.838).

6.42.2.2 `virtual int activemq::core::ActiveMQProducer::getDeliveryMode () const`
`throw (cms::CMSEException)` [inline, virtual]

Gets the delivery mode for this Producer.

Returns:

The DeliveryMode

Implements `cms::MessageProducer` (p.1879).

6.42.2.3 `virtual bool activemq::core::ActiveMQProducer::getDisableMessageID ()`
`const throw (cms::CMSEException)` [inline, virtual]

Gets if Message Ids are disabled for this Producer.

Returns:

a boolean indicating **state** (p.65) enable / disable (true / false) for MessageIds.

Implements `cms::MessageProducer` (p.1880).

6.42.2.4 `virtual bool ac-`
`tivemq::core::ActiveMQProducer::getDisableMessageTimeStamp () const`
`throw (cms::CMSEException)` [inline, virtual]

Gets if Message Time Stamps are disabled for this Producer.

Returns:

boolean indicating **state** (p.65) of enable / disable (true / false)

Implements `cms::MessageProducer` (p.1880).

6.42.2.5 `virtual int activemq::core::ActiveMQProducer::getPriority () const throw (cms::CMSEException) [inline, virtual]`

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Implements `cms::MessageProducer` (p.1880).

6.42.2.6 `commands::ProducerId& activemq::core::ActiveMQProducer::getProducerId () const [inline]`

Retries this object ProducerId or NULL if closed.

Returns:

ProducerId Reference

6.42.2.7 `const commands::ProducerInfo& activemq::core::ActiveMQProducer::getProducerInfo () const [inline]`

Retries this object ProducerInfo pointer.

Returns:

ProducerInfo Reference

6.42.2.8 `virtual long long activemq::core::ActiveMQProducer::getSendTimeout () const throw (cms::CMSEException) [inline, virtual]`

Gets the Send Timeout that this producer sends messages with.

Returns:

The default send timeout value in milliseconds.

6.42.2.9 `virtual long long activemq::core::ActiveMQProducer::getTimeToLive () const throw (cms::CMSEException) [inline, virtual]`

Gets the Time to Live that this producer sends messages with.

Returns:

The default time to live value in milliseconds.

Implements `cms::MessageProducer` (p.1880).

6.42.2.10 `bool activemq::core::ActiveMQProducer::isClosed () const [inline]`**Returns:**

true if this Producer has been closed.

6.42.2.11 `virtual void activemq::core::ActiveMQProducer::onProducerAck (const commands::ProducerAck & ack) [virtual]`

Handles the work of Processing a ProducerAck Command from the Broker.

Parameters:

ack - The ProducerAck message received from the Broker.

6.42.2.12 `virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * destination, cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSException) [virtual]`

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination - a Message Object Pointer

message - a Message Object Pointer

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException

Implements `cms::MessageProducer` (p.1881).

6.42.2.13 `virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * destination, cms::Message * message) throw (cms::CMSException) [virtual]`

Sends the message to the designated destination.

Parameters:

destination The CMS Destination that defines where the message is sent.

message A Message Object Pointer

Exceptions:

CMSException

Implements `cms::MessageProducer` (p.1881).

6.42.2.14 `virtual void activemq::core::ActiveMQProducer::send (cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)` [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message A Message Object Pointer

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSEException

Implements `cms::MessageProducer` (p. 1882).

6.42.2.15 `virtual void activemq::core::ActiveMQProducer::send (cms::Message * message) throw (cms::CMSEException)` [virtual]

Sends the message to the default producer destination.

Parameters:

message A Message Object Pointer for the Message to send.

Exceptions:

CMSEException

Implements `cms::MessageProducer` (p. 1882).

6.42.2.16 `virtual void activemq::core::ActiveMQProducer::setDeliveryMode (int mode) throw (cms::CMSEException)` [inline, virtual]

Sets the delivery mode for this Producer.

Parameters:

mode - The DeliveryMode to use for Message sends.

Implements `cms::MessageProducer` (p. 1882).

6.42.2.17 `virtual void activemq::core::ActiveMQProducer::setDisableMessageID (bool value) throw (cms::CMSEException)` [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Implements `cms::MessageProducer` (p. 1883).

6.42.2.18 virtual void activemq::core::ActiveMQProducer::setDisableMessageTimeStamp (bool *value*) throw (cms::CMSException) [inline, virtual]

Sets if Message Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Implements **cms::MessageProducer** (p.1883).

6.42.2.19 virtual void activemq::core::ActiveMQProducer::setPriority (int *priority*) throw (cms::CMSException) [inline, virtual]

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Implements **cms::MessageProducer** (p.1883).

6.42.2.20 virtual void activemq::core::ActiveMQProducer::setSendTimeout (long long *time*) throw (cms::CMSException) [inline, virtual]

Sets the Send Timeout that this Producers sends messages with.

Parameters:

time The new default send timeout value in milliseconds.

6.42.2.21 virtual void activemq::core::ActiveMQProducer::setTimeToLive (long long *time*) throw (cms::CMSException) [inline, virtual]

Sets the Time to Live that this Producers sends messages with.

Parameters:

time The new default time to live value in milliseconds.

Implements **cms::MessageProducer** (p.1883).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQProducer.h**

6.43 activemq::util::ActiveMQProperties Class Reference

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2140) object.

#include <src/main/activemq/util/ActiveMQProperties.h> Inheritance diagram for activemq::util::ActiveMQProperties:

Public Member Functions

- virtual **~ActiveMQProperties** ()
- virtual **decaf::util::Properties** & **getProperties** ()
- virtual const **decaf::util::Properties** & **getProperties** () const
- virtual void **setProperties** (decaf::util::Properties &props)
- virtual bool **isEmpty** () const
Returns true if the properties object is empty.
- virtual const char * **getProperty** (const std::string &name) const
Looks up the value for the given property.
- virtual std::string **getProperty** (const std::string &name, const std::string &defaultValue) const
Looks up the value for the given property.
- virtual void **setProperty** (const std::string &name, const std::string &value)
Sets the value for a given property.
- virtual bool **hasProperty** (const std::string &name) const
Check to see if the Property exists in the set.
- virtual void **remove** (const std::string &name)
Removes the property with the given name.
- virtual std::vector< std::pair< std::string, std::string > > **toArray** () const
Method that serializes the contents of the property map to an arrayay.
- virtual void **copy** (const CMSProperties *source)
Copies the contents of the given properties object to this one.
- virtual CMSProperties * **clone** () const
Clones this object.
- virtual void **clear** ()
Clears all properties from the map.
- virtual std::string **toString** () const
Formats the contents of the Properties Object into a string that can be logged, etc.

6.43.1 Detailed Description

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 2140) object.

Since:

2.0

6.43.2 Constructor & Destructor Documentation

6.43.2.1 `virtual activemq::util::ActiveMQProperties::~~ActiveMQProperties ()` [virtual]

6.43.3 Member Function Documentation

6.43.3.1 `virtual void activemq::util::ActiveMQProperties::clear ()` [inline, virtual]

Clears all properties from the map.

Implements **cms::CMSProperties** (p. 854).

6.43.3.2 `virtual CMSProperties* activemq::util::ActiveMQProperties::clone ()`
`const` [virtual]

Clones this object.

Returns:

a replica of this object.

Implements **cms::CMSProperties** (p. 854).

6.43.3.3 `virtual void activemq::util::ActiveMQProperties::copy (const`
`CMSProperties * source)` [virtual]

Copies the contents of the given properties object to this one.

Parameters:

source The source properties object.

6.43.3.4 `virtual const decaf::util::Properties& activemq::util::ActiveMQProperties::getProperties () const` [inline, virtual]

6.43.3.5 `virtual decaf::util::Properties& activemq::util::ActiveMQProperties::getProperties ()` [inline, virtual]

6.43.3.6 `virtual std::string activemq::util::ActiveMQProperties::getProperty (const std::string & name, const std::string & defaultValue) const` [inline, virtual]

Looks up the value for the given property.

Parameters:

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns:

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

Implements **cms::CMSProperties** (p. 854).

6.43.3.7 `virtual const char* activemq::util::ActiveMQProperties::getProperty (const std::string & name) const` [inline, virtual]

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

Returns:

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implements **cms::CMSProperties** (p. 855).

6.43.3.8 `virtual bool activemq::util::ActiveMQProperties::hasProperty (const std::string & name) const` [inline, virtual]

Check to see if the Property exists in the set.

Parameters:

name - property name to check for in this properties set.

Returns:

true if property exists, false otherwise.

Implements **cms::CMSProperties** (p. 855).

6.43.3.9 virtual bool activemq::util::ActiveMQProperties::isEmpty () const
[inline, virtual]

Returns true if the properties object is empty.

Returns:

true if empty

Implements **cms::CMSProperties** (p. 855).

6.43.3.10 virtual void activemq::util::ActiveMQProperties::remove (const std::string & name) [inline, virtual]

Removes the property with the given name.

Parameters:

name the name of the property to remove.

Implements **cms::CMSProperties** (p. 855).

6.43.3.11 virtual void activemq::util::ActiveMQProperties::setProperties (decaf::util::Properties & props) [inline, virtual]**6.43.3.12 virtual void activemq::util::ActiveMQProperties::setProperty (const std::string & name, const std::string & value)** [inline, virtual]

Sets the value for a given property. If the property already exists, overwrites the value.

Parameters:

name The name of the value to be written.

value The value to be written.

Implements **cms::CMSProperties** (p. 856).

6.43.3.13 virtual std::vector< std::pair< std::string, std::string > > activemq::util::ActiveMQProperties::toArray () const [inline, virtual]

Method that serializes the contents of the property map to an array.

Returns:

list of pairs where the first is the name and the second is the value.

Implements **cms::CMSProperties** (p. 856).

6.43.3.14 virtual std::string activemq::util::ActiveMQProperties::toString () const
[inline, virtual]

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns:

string value of this object.

Implements **cms::CMSProperties** (p. 856).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/ActiveMQProperties.h`

6.44 activemq::commands::ActiveMQQueue Class Reference

#include <src/main/activemq/commands/ActiveMQQueue.h> Inheritance diagram for activemq::commands::ActiveMQQueue:

Public Member Functions

- **ActiveMQQueue** ()
- **ActiveMQQueue** (const std::string &name)
- virtual ~**ActiveMQQueue** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.*
- virtual **ActiveMQQueue** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const cms::Destination * **getCMSDestination** () const
- virtual cms::Destination::DestinationType **getDestinationType** () const
Retrieve the Destination Type for this Destination.
- virtual cms::Destination * **clone** () const
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const cms::Destination &source)
Copies the contents of the given Destinastion object to this one.
- virtual const cms::CMSProperties & **getCMSProperties** () const
Retrieve any properties that might be part of the destination that was specified.
- virtual std::string **getQueueName** () const throw (cms::CMSException)
Gets the name of this queue.

Static Public Attributes

- static const unsigned char **ID _ACTIVEMQQUEUE** = 100

6.44.1 Constructor & Destructor Documentation

6.44.1.1 `activemq::commands::ActiveMQQueue::ActiveMQQueue ()`

6.44.1.2 `activemq::commands::ActiveMQQueue::ActiveMQQueue (const std::string & name)`

6.44.1.3 `virtual activemq::commands::ActiveMQQueue::~~ActiveMQQueue ()`
[inline, virtual]

6.44.2 Member Function Documentation

6.44.2.1 `virtual cms::Destination* activemq::commands::ActiveMQQueue::clone ()`
`const` [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p.1191).

6.44.2.2 `virtual ActiveMQQueue* activemq::commands::ActiveMQQueue::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 231).

6.44.2.3 `virtual void activemq::commands::ActiveMQQueue::copy (const cms::Destination & source)` [inline, virtual]

Copies the contents of the given Destination object to this one.

Parameters:

source The source Destination object.

6.44.2.4 `virtual void activemq::commands::ActiveMQQueue::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 232).

6.44.2.5 virtual bool activemq::commands::ActiveMQQueue::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

6.44.2.6 virtual const cms::Destination* activemq::commands::ActiveMQQueue::getCMSDestination () const [inline, virtual]**Returns:**

the **cms::Destination** (p. 1190) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

6.44.2.7 virtual const cms::CMSProperties& activemq::commands::ActiveMQQueue::getCMSProperties () const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

const reference to a properties object.

Implements **cms::Destination** (p. 1191).

6.44.2.8 virtual unsigned char activemq::commands::ActiveMQQueue::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

6.44.2.9 virtual cms::Destination::DestinationType activemq::commands::ActiveMQQueue::getDestinationType () const [inline, virtual]

Retrieve the Destination Type for this Destination.

Returns:

The Destination Type

Implements **activemq::commands::ActiveMQDestination** (p. 234).

References **cms::Destination::QUEUE**.

6.44.2.10 `virtual std::string activemq::commands::ActiveMQQueue::getQueueName
() const throw (cms::CMSException) [inline, virtual]`

Gets the name of this queue.

Returns:

The queue name.

Implements **cms::Queue** (p. 2157).

6.44.2.11 `virtual std::string activemq::commands::ActiveMQQueue::toString ()
const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 237).

6.44.3 Field Documentation

6.44.3.1 `const unsigned char activemq::commands::ActiveMQQueue::ID_-
ACTIVEMQQUEUE = 100 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ActiveMQQueue.h`

6.45 activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 341).

#include <src/main/activemq/wireformat/openwire/marshal/v3/ActiveMQQueueMarshaller.h>Inheritance diagram for activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller:

Public Member Functions

- **ActiveMQQueueMarshaller** ()
- virtual **~ActiveMQQueueMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.45.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 341). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.45.2 Constructor & Destructor Documentation

6.45.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::ActiveMQQueueMarshaller()` [inline]

6.45.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::~~ActiveMQQueueMarshaller()` [inline, virtual]

6.45.3 Member Function Documentation

6.45.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.45.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.45.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller` (p. 241).

6.45.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller` (p. 241).

6.45.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller` (p. 242).

```

6.45.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::tightMarshal2
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 242).

```

6.45.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller::tightUnmarshal
    (OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
    * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 243).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/ActiveMQQueueMarshaller.h

6.46 activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 345).

Write a object instance to data output stream.

6.46.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 345). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.46.2 Constructor & Destructor Documentation

6.46.2.1 `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::ActiveMQQueueMarshaller()` [inline]

6.46.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::~~ActiveMQQueueMarshaller()` [inline, virtual]

6.46.3 Member Function Documentation

6.46.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.46.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.46.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 245).

6.46.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 245).

6.46.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 246).

```

6.46.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::tightMarshal2
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 246).

```

6.46.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller::tightUnmarshal
    (OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
    * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 247).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.47.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 349). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.47.2 Constructor & Destructor Documentation

6.47.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::ActiveMQQueueMarshaller()` [inline]

6.47.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::~~ActiveMQQueueMarshaller()` [inline, virtual]

6.47.3 Member Function Documentation

6.47.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.47.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.47.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller` (p. 249).

6.47.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller` (p. 249).

6.47.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller` (p. 250).

```

6.47.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::tightMarshal2
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 250).

```

6.47.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v2::ActiveMQQueueMarshaller::tightUnmarshal
    (OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
    * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 251).

The documentation for this class was generated from the following file:

6.48 activemq::core::ActiveMQSession Class Reference

#include <src/main/activemq/core/ActiveMQSession.h> Inheritance diagram for activemq::core::ActiveMQSession:

Public Member Functions

- **ActiveMQSession** (const **Pointer**< **commands::SessionInfo** > &sessionInfo, **cms::Session::AcknowledgeMode** ackMode, const **decaf::util::Properties** &properties, **ActiveMQConnection** *connection)
- virtual **~ActiveMQSession** ()
- void **redispatch** (**MessageDispatchChannel** &unconsumedMessages)
Redispatches the given set of unconsumed messages to the consumers.
- void **start** ()
Stops asynchronous message delivery.
- void **stop** ()
Starts asynchronous message delivery.
- bool **isStarted** () const
*Indicates whether or not the session is currently in the started **state** (p. 65).*
- bool **isAutoAcknowledge** () const
- bool **isDupsOkAcknowledge** () const
- bool **isClientAcknowledge** () const
- void **fire** (const **exceptions::ActiveMQException** &ex)
Fires the given exception to the exception listener of the connection.
- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)
Dispatches a message to a particular consumer.
- virtual void **close** () throw (**cms::CMSEException**)
Closes this session as well as any active child consumers or producers.
- virtual void **commit** () throw (**cms::CMSEException**)
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** () throw (**cms::CMSEException**)
Rollsback all messages done in this transaction and releases any locks currently held.
- virtual void **recover** () throw (**cms::CMSEException**)
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination) throw (**cms::CMSEException**)
Creates a MessageConsumer for the specified destination.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createDurableConsumer** (const **cms::Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false) throw (cms::CMSEException)
Creates a durable subscriber to the specified topic, using a message selector.
- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination) throw (cms::CMSEException)
Creates a MessageProducer to send messages to the specified destination.
- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue) throw (cms::CMSEException)
Creates a new QueueBrowser to peek at Messages on the given Queue.
- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector) throw (cms::CMSEException)
Creates a new QueueBrowser to peek at Messages on the given Queue.
- virtual **cms::Queue** * **createQueue** (const std::string &queueName) throw (cms::CMSEException)
Creates a queue identity given a Queue name.
- virtual **cms::Topic** * **createTopic** (const std::string &topicName) throw (cms::CMSEException)
Creates a topic identity given a Queue name.
- virtual **cms::TemporaryQueue** * **createTemporaryQueue** () throw (cms::CMSEException)
Creates a TemporaryQueue object.
- virtual **cms::TemporaryTopic** * **createTemporaryTopic** () throw (cms::CMSEException)
Creates a TemporaryTopic object.
- virtual **cms::Message** * **createMessage** () throw (cms::CMSEException)
Creates a new Message.
- virtual **cms::BytesMessage** * **createBytesMessage** () throw (cms::CMSEException)
Creates a BytesMessage.
- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, std::size_t bytesSize) throw (cms::CMSEException)

Creates a BytesMessage and sets the pay-load to the passed value.

- virtual **cms::StreamMessage * createStreamMessage ()** throw (cms::CMSEException)

Creates a new StreamMessage.

- virtual **cms::TextMessage * createTextMessage ()** throw (cms::CMSEException)

Creates a new TextMessage.

- virtual **cms::TextMessage * createTextMessage** (const std::string &text) throw (cms::CMSEException)

Creates a new TextMessage and set the text to the value given.

- virtual **cms::MapMessage * createMapMessage ()** throw (cms::CMSEException)

Creates a new MapMessage.

- virtual **cms::Session::AcknowledgeMode getAcknowledgeMode ()** const throw (cms::CMSEException)

Returns the acknowledgment mode of the session.

- virtual bool **isTransacted ()** const throw (cms::CMSEException)

Gets if the Sessions is a Transacted Session.

- virtual void **unsubscribe** (const std::string &name) throw (cms::CMSEException)

Unsubscribes a durable subscription that has been created by a client.

- void **send** (cms::Message *message, ActiveMQProducer *producer, util::Usage *usage) throw (cms::CMSEException)

Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection.

- **cms::ExceptionListener * getExceptionListener ()**

This method gets any registered exception listener of this sessions connection and returns it.

- const **commands::SessionInfo & getSessionInfo ()** const

Gets the Session Information object for this session, if the session is closed than this method throws an exception.

- const **commands::SessionId & getSessionId ()** const

Gets the Session Id object for this session, if the session is closed than this method throws an exception.

- **ActiveMQConnection * getConnection ()** const

*Gets the **ActiveMQConnection** (p. 190) that is associated with this session.*

- void **oneway** (Pointer< **commands::Command** > command) throw (activemq::exceptions::ActiveMQException)

Sends a oneway message.

- void **syncRequest** (Pointer< **commands::Command** > command, unsigned int timeout=0) throw (activemq::exceptions::ActiveMQException)

Sends a synchronous request and returns the response from the broker.

- void **disposeOf** (decaf::lang::Pointer< commands::ConsumerId > id) throw (activemq::exceptions::ActiveMQException)

Dispose of a Consumer from this session.

- void **disposeOf** (decaf::lang::Pointer< commands::ProducerId > id) throw (activemq::exceptions::ActiveMQException)

Dispose of a Producer from this session.

- void **doStartTransaction** () throw (exceptions::ActiveMQException)

Starts if not already start a Transaction for this Session.

- void **deliverAcks** ()

Request that this Session inform all of its consumers to deliver their pending acks.

- void **clearMessagesInProgress** ()

Request that this Session inform all of its consumers to clear all messages that are currently in progress.

- void **wakeup** ()

Causes the Session to wakeup its executor and ensure all messages are dispatched.

Friends

- class **ActiveMQSessionExecutor**

6.48.1 Constructor & Destructor Documentation

- 6.48.1.1 **activemq::core::ActiveMQSession::ActiveMQSession** (const Pointer< commands::SessionInfo > & *sessionInfo*, cms::Session::AcknowledgeMode *ackMode*, const decaf::util::Properties & *properties*, ActiveMQConnection * *connection*)

- 6.48.1.2 **virtual activemq::core::ActiveMQSession::~~ActiveMQSession** () [virtual]

6.48.2 Member Function Documentation

- 6.48.2.1 **void activemq::core::ActiveMQSession::clearMessagesInProgress** ()

Request that this Session inform all of its consumers to clear all messages that are currently in progress.

- 6.48.2.2 **virtual void activemq::core::ActiveMQSession::close** () throw (cms::CMSException) [virtual]

Closes this session as well as any active child consumers or producers.

Exceptions:

CMSException

Implements **cms::Session** (p. 2273).

6.48.2.3 `virtual void activemq::core::ActiveMQSession::commit () throw (cms::CMSException) [virtual]`

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException

Implements **cms::Session** (p. 2274).

6.48.2.4 `virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * queue, const std::string & selector) throw (cms::CMSException) [virtual]`

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2274).

6.48.2.5 `virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * queue) throw (cms::CMSException) [virtual]`

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2274).

```
6.48.2.6 virtual cms::BytesMessage* ac-
        tivemq::core::ActiveMQSession::createBytesMessage (const
        unsigned char * bytes, std::size_t bytesSize) throw ( cms::CMSException
        ) [virtual]
```

Creates a BytesMessage and sets the pay-load to the passed value.

Parameters:

bytes - an array of bytes to set in the message

bytesSize - the size of the bytes array, or number of bytes to use

Returns:

a newly created BytesMessage.

Exceptions:

CMSException

Implements **cms::Session** (p. 2275).

```
6.48.2.7 virtual cms::BytesMessage* ac-
        tivemq::core::ActiveMQSession::createBytesMessage ()
        throw ( cms::CMSException ) [virtual]
```

Creates a BytesMessage.

Returns:

a newly created BytesMessage.

Exceptions:

CMSException

Implements **cms::Session** (p. 2275).

```
6.48.2.8 virtual cms::MessageConsumer* ac-
        tivemq::core::ActiveMQSession::createConsumer (const
        cms::Destination * destination, const std::string & selector, bool noLocal)
        throw ( cms::CMSException ) [virtual]
```

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination - The Destination that this consumer receiving messages for.

selector - The Message Selector string to use for this destination

noLocal - if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Exceptions:

CMSException

Implements **cms::Session** (p. 2275).

6.48.2.9 `virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * destination, const std::string & selector) throw (cms::CMSException)` [virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination - The Destination that this consumer receiving messages for.

selector - The Message Selector string to use for this destination

Exceptions:

CMSException

Implements **cms::Session** (p. 2276).

6.48.2.10 `virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * destination) throw (cms::CMSException)` [virtual]

Creates a MessageConsumer for the specified destination.

Parameters:

destination - The Destination that this consumer receiving messages for.

Exceptions:

CMSException

Implements **cms::Session** (p. 2276).

6.48.2.11 `virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createDurableConsumer (const cms::Topic * destination, const std::string & name, const std::string & selector, bool noLocal = false) throw (cms::CMSException)` [virtual]

Creates a durable subscriber to the specified topic, using a message selector.

Parameters:

destination - the topic to subscribe to
name - The name used to identify the subscription
selector - only messages matching the selector are received
noLocal - if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Exceptions:

CMSException

Implements **cms::Session** (p. 2277).

6.48.2.12 `virtual cms::MapMessage* activemq::core::ActiveMQSession::createMapMessage () throw (cms::CMSException) [virtual]`

Creates a new MapMessage.

Returns:

a newly created MapMessage.

Exceptions:

CMSException

Implements **cms::Session** (p. 2277).

6.48.2.13 `virtual cms::Message* activemq::core::ActiveMQSession::createMessage () throw (cms::CMSException) [virtual]`

Creates a new Message.

Exceptions:

CMSException

Implements **cms::Session** (p. 2278).

6.48.2.14 `virtual cms::MessageProducer* activemq::core::ActiveMQSession::createProducer (const cms::Destination * destination) throw (cms::CMSException) [virtual]`

Creates a MessageProducer to send messages to the specified destination.

Parameters:

destination - the Destination to publish on

Exceptions:

CMSException

Implements **cms::Session** (p. 2278).

6.48.2.15 `virtual cms::Queue* activemq::core::ActiveMQSession::createQueue
(const std::string & queueName) throw (cms::CMSException)
[virtual]`

Creates a queue identity given a Queue name.

Parameters:

queueName - the name of the new Queue

Exceptions:

CMSException

Implements **cms::Session** (p. 2278).

6.48.2.16 `virtual cms::StreamMessage* ac-
tivismq::core::ActiveMQSession::createStreamMessage ()
throw (cms::CMSException) [virtual]`

Creates a new StreamMessage.

Returns:

a newly created StreamMessage.

Exceptions:

CMSException

Implements **cms::Session** (p. 2279).

6.48.2.17 `virtual cms::TemporaryQueue* ac-
tivismq::core::ActiveMQSession::createTemporaryQueue ()
throw (cms::CMSException) [virtual]`

Creates a TemporaryQueue object.

Exceptions:

CMSException

Implements **cms::Session** (p. 2279).

6.48.2.18 `virtual cms::TemporaryTopic* ac-
tivismq::core::ActiveMQSession::createTemporaryTopic ()
throw (cms::CMSException) [virtual]`

Creates a TemporaryTopic object.

Exceptions:

CMSException

Implements **cms::Session** (p. 2279).

6.48.2.19 `virtual cms::TextMessage* activemq::core::ActiveMQSession::createTextMessage (const std::string & text) throw (cms::CMSException) [virtual]`

Creates a new TextMessage and set the text to the value given.

Parameters:

text - The initial text for the message

Returns:

a newly created TextMessage with the given Text set in the Message body.

Exceptions:

CMSException

Implements **cms::Session** (p. 2279).

6.48.2.20 `virtual cms::TextMessage* activemq::core::ActiveMQSession::createTextMessage () throw (cms::CMSException) [virtual]`

Creates a new TextMessage.

Returns:

a newly created TextMessage.

Exceptions:

CMSException

Implements **cms::Session** (p. 2280).

6.48.2.21 `virtual cms::Topic* activemq::core::ActiveMQSession::createTopic (const std::string & topicName) throw (cms::CMSException) [virtual]`

Creates a topic identity given a Queue name.

Parameters:

topicName - the name of the new Topic

Exceptions:

CMSException

Implements **cms::Session** (p. 2280).

6.48.2.22 `void activemq::core::ActiveMQSession::deliverAcks ()`

Request that this Session inform all of its consumers to deliver their pending acks.

6.48.2.23 `virtual void activemq::core::ActiveMQSession::dispatch (const Pointer< MessageDispatch > & message) [virtual]`

Dispatches a message to a particular consumer.

Parameters:

message - the message to be dispatched

Implements `activemq::core::Dispatcher` (p. 1230).

6.48.2.24 `void activemq::core::ActiveMQSession::disposeOf (decaf::lang::Pointer< commands::ProducerId > id) throw (activemq::exceptions::ActiveMQException)`

Dispose of a Producer from this session. Removes it from the Connection and clean up any resources associated with it.

Parameters:

id - the Id of the Producer to dispose.

Exceptions:

ActiveMQException if an internal error occurs.

6.48.2.25 `void activemq::core::ActiveMQSession::disposeOf (decaf::lang::Pointer< commands::ConsumerId > id) throw (activemq::exceptions::ActiveMQException)`

Dispose of a Consumer from this session. Removes it from the Connection and clean up any resources associated with it.

Parameters:

id - the Id of the Consumer to dispose.

Exceptions:

ActiveMQException if an internal error occurs.

6.48.2.26 `void activemq::core::ActiveMQSession::doStartTransaction () throw (exceptions::ActiveMQException)`

Starts if not already start a Transaction for this Session. If the session is not a Transacted Session then an exception is thrown. If a transaction is already in progress then this method has no effect.

Exceptions:

ActiveMQException if this is not a Transacted Session.

6.48.2.27 `void activemq::core::ActiveMQSession::fire (const exceptions::ActiveMQException & ex)`

Fires the given exception to the exception listener of the connection.

6.48.2.28 `virtual cms::Session::AcknowledgeMode activemq::core::ActiveMQSession::getAcknowledgeMode () const throw (cms::CMSException) [virtual]`

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Implements `cms::Session` (p. 2280).

6.48.2.29 `ActiveMQConnection* activemq::core::ActiveMQSession::getConnection () const [inline]`

Gets the `ActiveMQConnection` (p. 190) that is associated with this session.

6.48.2.30 `cms::ExceptionListener* activemq::core::ActiveMQSession::getExceptionListener ()`

This method gets any registered exception listener of this sessions connection and returns it. Mainly intended for use by the objects that this session creates so that they can notify the client of `exceptions` (p. 62) that occur in the context of another thread.

Returns:

`cms::ExceptionListener` (p. 1275) pointer or NULL

6.48.2.31 `const commands::SessionId& activemq::core::ActiveMQSession::getSessionId () const [inline]`

Gets the Session Id object for this session, if the session is closed than this method throws an exception.

Returns:

SessionId Reference

6.48.2.32 `const commands::SessionInfo& activemq::core::ActiveMQSession::getSessionInfo () const [inline]`

Gets the Session Information object for this session, if the session is closed than this method throws an exception.

Returns:

SessionInfo Reference

6.48.2.33 `bool activemq::core::ActiveMQSession::isAutoAcknowledge () const`
[inline]

References cms::Session::AUTO_ACKNOWLEDGE.

6.48.2.34 `bool activemq::core::ActiveMQSession::isClientAcknowledge () const`
[inline]

References cms::Session::CLIENT_ACKNOWLEDGE.

6.48.2.35 `bool activemq::core::ActiveMQSession::isDupsOkAcknowledge () const`
[inline]

References cms::Session::DUPS_OK_ACKNOWLEDGE.

6.48.2.36 `bool activemq::core::ActiveMQSession::isStarted () const`

Indicates whether or not the session is currently in the started **state** (p. 65).

6.48.2.37 `virtual bool activemq::core::ActiveMQSession::isTransacted () const`
`throw (cms::CMSException)` [virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Implements cms::Session (p. 2281).

6.48.2.38 `void activemq::core::ActiveMQSession::oneway`
`(Pointer< commands::Command > command) throw (`
`activemq::exceptions::ActiveMQException)`

Sends a oneway message.

Parameters:

command The message to send.

Exceptions:

ActiveMQException if not currently connected, or if the operation fails for any reason.

6.48.2.39 `virtual void activemq::core::ActiveMQSession::recover () throw (cms::CMSEException) [virtual]`

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSEException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements `cms::Session` (p. 2281).

6.48.2.40 `void activemq::core::ActiveMQSession::redispatch (MessageDispatchChannel & unconsumedMessages)`

Redispatches the given set of unconsumed messages to the consumers.

Parameters:

unconsumedMessages - unconsumed messages to be redelivered.

6.48.2.41 `virtual void activemq::core::ActiveMQSession::rollback () throw (cms::CMSEException) [virtual]`

Rollsback all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSEException

Implements `cms::Session` (p. 2281).

6.48.2.42 `void activemq::core::ActiveMQSession::send (cms::Message * message, ActiveMQProducer * producer, util::Usage * usage) throw (cms::CMSEException)`

Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection. Asynchronous sends will be chosen if at all possible.

Parameters:

- message* The message to send to the broker.
- producer* The sending Producer
- usage* Pointer to a Usage tracker which if set will be increased by the size of the given message.

Exceptions:

CMSException

6.48.2.43 void activemq::core::ActiveMQSession::start ()

Stops asynchronous message delivery.

6.48.2.44 void activemq::core::ActiveMQSession::stop ()

Starts asynchronous message delivery.

6.48.2.45 void activemq::core::ActiveMQSession::syncRequest (Pointer< commands::Command > *command*, unsigned int *timeout* = 0) throw (activemq::exceptions::ActiveMQException)

Sends a synchronous request and returns the response from the broker. Converts any error responses into an exception.

Parameters:

- command* The request command.
- timeout* The time to wait for a response, default is zero or infinite.

Exceptions:

ActiveMQException thrown if an error response was received from the broker, or if any other error occurred.

6.48.2.46 virtual void activemq::core::ActiveMQSession::unsubscribe (const std::string & *name*) throw (cms::CMSException) [virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the **state** (p. 65) being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

- name* the name used to identify this subscription

Exceptions:

CMSException

Implements **cms::Session** (p. 2282).

6.48.2.47 void activemq::core::ActiveMQSession::wakeup ()

Causes the Session to wakeup its executor and ensure all messages are dispatched.

6.48.3 Friends And Related Function Documentation**6.48.3.1 friend class ActiveMQSessionExecutor [friend]**

*Iterates on the **MessageDispatchChannel** (p. 1805) sending all pending messages to the Consumers they are destined for.*
- std::vector< **Pointer**< **MessageDispatch** > > **getUnconsumedMessages** ()

6.49.1 Detailed Description

Delegate dispatcher for a single session. Contains a thread to provide for asynchronous dispatching.

6.49.2 Constructor & Destructor Documentation

6.49.2.1 `activemq::core::ActiveMQSessionExecutor::ActiveMQSessionExecutor (ActiveMQSession * session)`

Creates an un-started executor for the given session.

6.49.2.2 `virtual activemq::core::ActiveMQSessionExecutor::~~ActiveMQSessionExecutor () [virtual]`

Calls `stop()` (p. 372) then `clear()` (p. 370).

6.49.3 Member Function Documentation

6.49.3.1 `virtual void activemq::core::ActiveMQSessionExecutor::clear () [inline, virtual]`

Removes all queued messages and destroys them.

6.49.3.2 `virtual void activemq::core::ActiveMQSessionExecutor::clearMessagesInProgress () [inline, virtual]`

Removes all messages in the Dispatch Channel so that non are delivered.

6.49.3.3 `virtual void activemq::core::ActiveMQSessionExecutor::close () [inline, virtual]`

Terminates the dispatching thread. Once this is called, the executor is no longer usable.

6.49.3.4 `virtual void activemq::core::ActiveMQSessionExecutor::execute (const Pointer< MessageDispatch > & data) [virtual]`

Executes the dispatch. Adds the given data to the end of the queue.

Parameters:

data - the data to be dispatched.

6.49.3.5 `virtual void activemq::core::ActiveMQSessionExecutor::executeFirst (const Pointer< MessageDispatch > & data) [virtual]`

Executes the dispatch. Adds the given data to the beginning of the queue.

Parameters:

data - the data to be dispatched.

6.49.3.6 `std::vector< Pointer<MessageDispatch> > activemq::core::ActiveMQSessionExecutor::getUnconsumedMessages ()`
[inline]

Returns:

a vector containing all the unconsumed messages, this clears the Message Dispatch Channel when called.

6.49.3.7 `virtual bool activemq::core::ActiveMQSessionExecutor::hasUnconsumedMessages ()`
`const` [inline, virtual]

Returns:

true if there are any pending messages in the dispatch channel.

6.49.3.8 `virtual bool activemq::core::ActiveMQSessionExecutor::isEmpty ()`
[inline, virtual]

Returns:

true if there are no messages in the Dispatch Channel.

6.49.3.9 `virtual bool activemq::core::ActiveMQSessionExecutor::isRunning ()` `const`
[inline, virtual]

Returns:

true indicates if the executor is started

6.49.3.10 `virtual bool activemq::core::ActiveMQSessionExecutor::iterate ()`
[virtual]

Iterates on the **MessageDispatchChannel** (p.1805) sending all pending messages to the Consumers they are destined for.

Returns:

false if there are no more messages to dispatch.

Implements **activemq::threads::Task** (p.2520).

6.49.3.11 `virtual void activemq::core::ActiveMQSessionExecutor::start ()`
[virtual]

Starts the dispatching.

6.49.3.12 `virtual void activemq::core::ActiveMQSessionExecutor::stop ()` [virtual]

Stops dispatching.

6.49.3.13 `virtual void activemq::core::ActiveMQSessionExecutor::wakeup ()`
[virtual]

wakeup this executer and dispatch any pending messages.

The documentation for this class was generated from the following file:

- `src/main/activemq/core/ActiveMQSessionExecutor.h`

6.50 activemq::commands::ActiveMQStreamMessage Class Reference

#include <src/main/activemq/commands/ActiveMQStreamMessage.h> Inheritance diagram for activemq::commands::ActiveMQStreamMessage:

Public Member Functions

- **ActiveMQStreamMessage** ()
- virtual **~ActiveMQStreamMessage** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ActiveMQStreamMessage * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual bool **isMarshalAware** () const
Determine if this object is aware of marshaling and should have its before and after marshaling methods called.
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat) throw (decaf::io::IOException)
Perform any processing needed before an marshal.
- virtual **cms::StreamMessage * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual void **clearBody** () throw (cms::CMSEException)
Clears out the body of the message.
- virtual void **reset** () throw (cms::CMSEException)
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () const throw (cms::CMSEException)
Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value) throw (cms::CMSEException)

Writes a boolean to the bytes message stream as a 1-byte value.

- virtual unsigned char **readByte** () const throw (cms::CMSEException)
Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value) throw (cms::CMSEException)
Writes a byte to the bytes message stream as a 1-byte value.
- virtual std::size_t **readBytes** (std::vector< unsigned char > &value) const throw (cms::CMSEException)
Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value) throw (cms::CMSEException)
Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual std::size_t **readBytes** (unsigned char *&buffer, std::size_t length) const throw (cms::CMSEException)
Reads a portion of the bytes message stream.
- virtual void **writeBytes** (const unsigned char *value, std::size_t offset, std::size_t length) throw (cms::CMSEException)
Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () const throw (cms::CMSEException)
Reads a Char from the Bytes message stream.
- virtual void **writeChar** (char value) throw (cms::CMSEException)
Writes a char to the bytes message stream as a 1-byte value.
- virtual float **readFloat** () const throw (cms::CMSEException)
Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value) throw (cms::CMSEException)
Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () const throw (cms::CMSEException)
Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value) throw (cms::CMSEException)
Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () const throw (cms::CMSEException)
Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value) throw (cms::CMSEException)
Writes a signed short to the bytes message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const throw (cms::CMSEException)

Reads a 16 bit unsigned short from the Bytes message stream.

- virtual void **writeUnsignedShort** (unsigned short value) throw (cms::CMSEException)

Writes a unsigned short to the bytes message stream as a 2 byte value.

- virtual int **readInt** () const throw (cms::CMSEException)

Reads a 32 bit signed intger from the Bytes message stream.

- virtual void **writeInt** (int value) throw (cms::CMSEException)

Writes a signed int to the bytes message stream as a 4 byte value.

- virtual long long **readLong** () const throw (cms::CMSEException)

Reads a 64 bit long from the Bytes message stream.

- virtual void **writeLong** (long long value) throw (cms::CMSEException)

Writes a long long to the bytes message stream as a 8 byte value.

- virtual std::string **readString** () const throw (cms::CMSEException)

Reads an ASCII String from the Bytes message stream.

- virtual void **writeString** (const std::string &value) throw (cms::CMSEException)

Writes an ASCII String to the Bytes message stream.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQSTREAMMESSAGE** = 27

Protected Member Functions

- void **checkWriteOnlyBody** () const throw (cms::CMSEException)

Throws an exception if in write-only mode.

- util::PrimitiveList & **getList** () throw (decaf::lang::exceptions::NullPointerException)

Fetches a reference to this objects PrimitiveList, if one needs to be created or unmarshaled, this will perform the correct steps.

- const util::PrimitiveList & **getList** () const throw (decaf::lang::exceptions::NullPointerException)

- void **checkListIsUnmarshalled** () const throw (decaf::lang::exceptions::NullPointerException)

Performs the unmarshal on the List if needed, otherwise just returns.

6.50.1 Constructor & Destructor Documentation

6.50.1.1 `activemq::commands::ActiveMQStreamMessage::ActiveMQStreamMessage()`

6.50.1.2 `virtual
activemq::commands::ActiveMQStreamMessage::~~ActiveMQStreamMessage()
[virtual]`

6.50.2 Member Function Documentation

6.50.2.1 `virtual void ac-
tivemq::commands::ActiveMQStreamMessage::beforeMarshal
(wireformat::WireFormat * wireFormat) throw (decaf::io::IOException)
[virtual]`

Perform any processing needed before an marshal.

Parameters:

wireFormat - the OpenWireFormat object in use.

Implements `activemq::wireformat::MarshalAware` (p. 1713).

6.50.2.2 `void ac-
tivemq::commands::ActiveMQStreamMessage::checkListIsUnmarshalled ()
const throw (decaf::lang::exceptions::NullPointerException) [protected]`

Performs the unmarshal on the List if needed, otherwise just returns.

6.50.2.3 `void ac-
tivemq::commands::ActiveMQStreamMessage::checkWriteOnlyBody ()
const throw (cms::CMSException) [protected]`

Throws an exception if in write-only mode.

Exceptions:

CMSException.

6.50.2.4 `virtual void activemq::commands::ActiveMQStreamMessage::clearBody ()
throw (cms::CMSException) [inline, virtual]`

Clears out the body of the message. This does not clear the headers or properties.

Reimplemented from `activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >` (p. 297).

6.50.2.5 `virtual cms::StreamMessage* ac-
tivemq::commands::ActiveMQStreamMessage::clone ()
const [inline, virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements **cms::Message** (p.1758).

6.50.2.6 `virtual ActiveMQStreamMessage* activemq::commands::ActiveMQStreamMessage::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Message** (p.1741).

6.50.2.7 `virtual void activemq::commands::ActiveMQStreamMessage::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::Message** (p.1742).

6.50.2.8 `virtual bool activemq::commands::ActiveMQStreamMessage::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p.1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Message** (p.1742).

6.50.2.9 `virtual unsigned char activemq::commands::ActiveMQStreamMessage::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p.1174) type copy.

Reimplemented from **activemq::commands::Message** (p.1743).

6.50.2.10 `const util::PrimitiveList& activemq::commands::ActiveMQStreamMessage::getList () const throw (decaf::lang::exceptions::NullPointerException) [protected]`

6.50.2.11 `util::PrimitiveList& activemq::commands::ActiveMQStreamMessage::getList () throw (decaf::lang::exceptions::NullPointerException) [protected]`

Fetches a reference to this objects PrimitiveList, if one needs to be created or unmarshaled, this will perform the correct steps.

Returns:

reference to a PrimitiveList.

6.50.2.12 `virtual bool activemq::commands::ActiveMQStreamMessage::isMarshalAware () const [inline, virtual]`

Determine if this object is aware of marshaling and should have its before and after marshaling methods called. Defaults to false.

Returns:

true if aware of marshaling

Reimplemented from `activemq::commands::Message` (p. 1746).

6.50.2.13 `virtual bool activemq::commands::ActiveMQStreamMessage::readBoolean () const throw (cms::CMSException) [virtual]`

Reads a Boolean from the Bytes message stream.

Returns:

boolean value from stream

Exceptions:

CMSException

Implements `cms::StreamMessage` (p. 2478).

6.50.2.14 `virtual unsigned char activemq::commands::ActiveMQStreamMessage::readByte () const throw (cms::CMSException) [virtual]`

Reads a Byte from the Bytes message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2478).

6.50.2.15 `virtual std::size_t activemq::commands::ActiveMQStreamMessage::readBytes (unsigned char *& buffer, std::size_t length) const throw (cms::CMSException)` [virtual]

Reads a portion of the bytes message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an `IndexOutOfBoundsException` is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer - the buffer into which the data is read

length - the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2479).

6.50.2.16 `virtual std::size_t activemq::commands::ActiveMQStreamMessage::readBytes (std::vector< unsigned char > & value) const throw (cms::CMSException)` [virtual]

Reads a byte array from the bytes message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value - buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSEException if an error occurs.

Implements **cms::StreamMessage** (p. 2479).

6.50.2.17 `virtual char activemq::commands::ActiveMQStreamMessage::readChar ()
const throw (cms::CMSEException) [virtual]`

Reads a Char from the Bytes message stream.

Returns:

char value from stream

Exceptions:

CMSEException

Implements **cms::StreamMessage** (p. 2480).

6.50.2.18 `virtual double ac-
tivismq::commands::ActiveMQStreamMessage::readDouble
() const throw (cms::CMSEException) [virtual]`

Reads a 64 bit double from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSEException

Implements **cms::StreamMessage** (p. 2480).

6.50.2.19 `virtual float activemq::commands::ActiveMQStreamMessage::readFloat
() const throw (cms::CMSEException) [virtual]`

Reads a 32 bit float from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSEException

Implements **cms::StreamMessage** (p. 2481).

6.50.2.20 `virtual int activemq::commands::ActiveMQStreamMessage::readInt ()
const throw (cms::CMSEException) [virtual]`

Reads a 32 bit signed integer from the Bytes message stream.

Returns:

int value from stream

Exceptions:

CMSEException

Implements `cms::StreamMessage` (p. 2481).

6.50.2.21 `virtual long long ac-
tivemq::commands::ActiveMQStreamMessage::readLong ()
const throw (cms::CMSEException) [virtual]`

Reads a 64 bit long from the Bytes message stream.

Returns:

long long value from stream

Exceptions:

CMSEException

Implements `cms::StreamMessage` (p. 2482).

6.50.2.22 `virtual short activemq::commands::ActiveMQStreamMessage::readShort
() const throw (cms::CMSEException) [virtual]`

Reads a 16 bit signed short from the Bytes message stream.

Returns:

short value from stream

Exceptions:

CMSEException

Implements `cms::StreamMessage` (p. 2482).

6.50.2.23 `virtual std::string ac-
tivemq::commands::ActiveMQStreamMessage::readString
() const throw (cms::CMSEException) [virtual]`

Reads an ASCII String from the Bytes message stream.

Returns:

String from stream

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2482).

6.50.2.24 `virtual unsigned short activemq::commands::ActiveMQStreamMessage::readUnsignedShort () const throw (cms::CMSException) [virtual]`

Reads a 16 bit unsigned short from the Bytes message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2483).

6.50.2.25 `virtual void activemq::commands::ActiveMQStreamMessage::reset () throw (cms::CMSException) [virtual]`

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions:

CMSException

6.50.2.26 `virtual std::string activemq::commands::ActiveMQStreamMessage::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1749).

6.50.2.27 `virtual void activemq::commands::ActiveMQStreamMessage::writeBoolean (bool value) throw (cms::CMSException) [virtual]`

Writes a boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value - boolean to write to the stream

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2483).

6.50.2.28 virtual void activemq::commands::ActiveMQStreamMessage::writeByte
(unsigned char *value*) throw (cms::CMSException) [virtual]

Writes a byte to the bytes message stream as a 1-byte value.

Parameters:

value - byte to write to the stream

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2483).

6.50.2.29 virtual void activemq::commands::ActiveMQStreamMessage::writeBytes
(const unsigned char * *value*, std::size_t *offset*, std::size_t *length*)
throw (cms::CMSException) [virtual]

Writes a portion of a byte array to the bytes message stream. *size* as the number of bytes to write.

Parameters:

value - bytes to write to the stream

offset - the initial offset within the byte array

length - the number of bytes to use

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2484).

6.50.2.30 virtual void activemq::commands::ActiveMQStreamMessage::writeBytes
(const std::vector< unsigned char > & *value*) throw (cms::CMSException
) [virtual]

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters:

value - bytes to write to the stream

Exceptions:

CMSException

Implements **cms::StreamMessage** (p. 2484).

6.50.2.31 **virtual void activemq::commands::ActiveMQStreamMessage::writeChar**
(char *value*) throw (cms::CMSException) [virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters:

value - char to write to the stream

Exceptions:

CMSException

Implements cms::StreamMessage (p. 2485).

6.50.2.32 **virtual void activemq::commands::ActiveMQStreamMessage::writeDouble**
(double *value*) throw (cms::CMSException) [virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters:

value - double to write to the stream

Exceptions:

CMSException

Implements cms::StreamMessage (p. 2485).

6.50.2.33 **virtual void activemq::commands::ActiveMQStreamMessage::writeFloat**
(float *value*) throw (cms::CMSException) [virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters:

value - float to write to the stream

Exceptions:

CMSException

Implements cms::StreamMessage (p. 2485).

6.50.2.34 **virtual void activemq::commands::ActiveMQStreamMessage::writeInt**
(int *value*) throw (cms::CMSException) [virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters:

value - signed int to write to the stream

Exceptions:

CMSException

Implements cms::StreamMessage (p. 2486).

6.50.2.35 virtual void activemq::commands::ActiveMQStreamMessage::writeLong
(long long *value*) throw (cms::CMSEException) [virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters:

value - signed long long to write to the stream

Exceptions:

CMSEException

Implements cms::StreamMessage (p. 2486).

6.50.2.36 virtual void activemq::commands::ActiveMQStreamMessage::writeShort
(short *value*) throw (cms::CMSEException) [virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters:

value - signed short to write to the stream

Exceptions:

CMSEException

Implements cms::StreamMessage (p. 2486).

6.50.2.37 virtual void activemq::commands::ActiveMQStreamMessage::writeString
(const std::string & *value*) throw (cms::CMSEException) [virtual]

Writes an ASCII String to the Bytes message stream.

Parameters:

value - String to write to the stream

Exceptions:

CMSEException

Implements cms::StreamMessage (p. 2487).

6.50.2.38 virtual void ac-
tivemq::commands::ActiveMQStreamMessage::writeUnsignedShort
(unsigned short *value*) throw (cms::CMSEException) [virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value - unsigned short to write to the stream

Exceptions:

CMSException

Implements `cms::StreamMessage` (p. 2487).

6.50.3 Field Documentation

Write a object instance to data output stream.

6.51.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p. 387).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.51.2 Constructor & Destructor Documentation

6.51.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::ActiveMQStreamMessageMarshaller()` [inline]

6.51.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::~ActiveMQStreamMessageMarshaller()` [inline, virtual]

6.51.3 Member Function Documentation

6.51.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.51.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.51.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::marshal(commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.51

activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller

Class Reference

389

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1867).

6.51.3.4 virtual void ac-

```
tivemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::looseUnmarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn) throw (
    decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1867).

6.51.3.5 virtual int ac-

```
tivemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::tightMarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1868).

6.51.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

6.51.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

The documentation for this class was generated from the following file:

6.52.2.1 `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::ActiveMQStreamMessageMarshaller()` [inline]

6.52.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::~ActiveMQStreamMessageMarshaller()` [inline, virtual]

6.52.3 Member Function Documentation

6.52.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.52.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.52.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::marshal(commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.52

activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller

Class Reference

393

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1872).

6.52.3.4 virtual void ac-

```
timemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::looseUnmarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn) throw (
    decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1872).

6.52.3.5 virtual int ac-

```
timemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::tightMarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1873).

6.52.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.52.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

The documentation for this class was generated from the following file:

6.53.3 Member Function Documentation

6.53.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.53.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.53.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller::marshal(commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

6.53

activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller

Class Reference

397

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1862).

6.53.3.4 virtual void ac-

```
tivemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller::looseUnmarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn) throw (
    decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1862).

6.53.3.5 virtual int ac-

```
tivemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller::tightMarshal(
    OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1863).

6.53.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

6.53.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

The documentation for this class was generated from the following file:

Public Member Functions

- **ActiveMQTempDestination** ()
- **ActiveMQTempDestination** (const std::string &name)
- virtual ~**ActiveMQTempDestination** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTempDestination** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual void **close** () throw (cms::CMSException)
Closes down this Destination resulting in a call to dispose of the TempDestination resource at the Broker.
- void **setConnection** (core::ActiveMQConnection *connection)
Sets the Parent Connection that is notified when this destination is destroyed.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTEMPDESTINATION** = 0

Protected Attributes

- core::ActiveMQConnection * **connection**
Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

6.54.1 Constructor & Destructor Documentation

- 6.54.1.1** `activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination()`
- 6.54.1.2** `activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination(const std::string & name)`
- 6.54.1.3** `virtual activemq::commands::ActiveMQTempDestination::~~ActiveMQTempDestination()` [virtual]

6.54.2 Member Function Documentation

- 6.54.2.1** `virtual ActiveMQTempDestination* activemq::commands::ActiveMQTempDestination::cloneDataStructure()` `const` [inline, virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 231).

Reimplemented in `activemq::commands::ActiveMQTempQueue` (p. 416), and `activemq::commands::ActiveMQTempTopic` (p. 433).

- 6.54.2.2** `virtual void activemq::commands::ActiveMQTempDestination::close()` `throw (cms::CMSException)` [virtual]

Closes down this Destination resulting in a call to dispose of the TempDestination resource at the Broker. This should only be called when the user is certain that they are finished with this destination. The TempDestination is not closed automatically on shutdown. throws `cms::CMSException` (p. 850)

Implements `cms::Closeable` (p. 838).

- 6.54.2.3** `virtual void activemq::commands::ActiveMQTempDestination::copyDataStructure(const DataStructure * src)` [inline, virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 232).

Reimplemented in `activemq::commands::ActiveMQTempQueue` (p. 417), and `activemq::commands::ActiveMQTempTopic` (p. 434).

References `activemq::commands::ActiveMQDestination::copyDataStructure()`.

6.54.2.4 virtual bool activemq::commands::ActiveMQTempDestination::equals (const DataStructure * *value*) const [inline, virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 417), and **activemq::commands::ActiveMQTempTopic** (p. 434).

References **activemq::commands::ActiveMQDestination::equals()**.

6.54.2.5 virtual unsigned char activemq::commands::ActiveMQTempDestination::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 418), and **activemq::commands::ActiveMQTempTopic** (p. 435).

6.54.2.6 void activemq::commands::ActiveMQTempDestination::setConnection (core::ActiveMQConnection * *connection*) [inline]

Sets the Parent Connection that is notified when this destination is destroyed.

Parameters:

connection - The parent connection.

6.54.2.7 virtual std::string activemq::commands::ActiveMQTempDestination::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 237).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 418), and **activemq::commands::ActiveMQTempTopic** (p. 435).

6.54.3 Field Documentation

6.54.3.1 `core::ActiveMQConnection* activemq::commands::ActiveMQTempDestination::connection`
[protected]

Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

6.54.3.2 `const unsigned char`
`activemq::commands::ActiveMQTempDestination::ID_ -`
`ACTIVEMQTEMPDESTINATION = 0` [static]

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.55.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempDestinationMarshaller** (p. 403).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.55.2 Constructor & Destructor Documentation

6.55.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller::ActiveMQTempDestinationMarshaller()` [inline]

6.55.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller::~ActiveMQTempDestinationMarshaller()` [inline, virtual]

6.55.3 Member Function Documentation

6.55.3.1 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller::marshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller` (p. 241).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller` (p. 421), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller` (p. 438).

6.55.3.2 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller::unmarshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataIn* - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the `unmarshal`.

6.55

activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller

Class Reference

405

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 241).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller** (p. 422), and **activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller** (p. 439).

```
6.55.3.3 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller::tightMa
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 242).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller** (p. 422), and **activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller** (p. 439).

```
6.55.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller::tightMa
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller` (p. 242).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller` (p. 423), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller` (p. 440).

6.55.3.5 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller` (p. 243).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller` (p. 423), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller` (p. 440).

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 245).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 425), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 442).

6.56.3.2 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller::unmarshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataIn* - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the `unmarshal`.

6.56

activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller

Class Reference

409

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 245).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 426), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 443).

6.56.3.3 virtual int ac-
tivemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller::tightMa
(OpenWireFormat * *wireFormat*, commands::DataStructure *
***dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)**
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 246).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 426), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 443).

6.56.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller::tightMa
(OpenWireFormat * *wireFormat*, commands::DataStructure
*** *dataStructure*, decaf::io::DataOutputStream * *dataOut*,**
utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 246).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 427), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 444).

6.56.3.5 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 247).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 427), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 444).

6.57.3 Member Function Documentation

6.57.3.1 `virtual void activate(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller` (p. 249).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller` (p. 429), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller` (p. 446).

6.57.3.2 `virtual void deactivate(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataIn* - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the `unmarshal`.

6.57

activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller

Class Reference

413

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 249).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller** (p. 430), and **activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller** (p. 447).

```
6.57.3.3 virtual int ac-
tivemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller::tightMa
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, utils::BooleanStream * bs) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 250).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller** (p. 430), and **activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller** (p. 447).

```
6.57.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller::tightMa
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller` (p. 250).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller` (p. 431), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller` (p. 448).

6.57.3.5 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller` (p. 251).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller` (p. 431), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller` (p. 448).

6.58.1 Constructor & Destructor Documentation

6.58.1.1 `activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue ()`

6.58.1.2 `activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue (const std::string & name)`

6.58.1.3 `virtual
activemq::commands::ActiveMQTempQueue::~~ActiveMQTempQueue ()
[virtual]`

6.58.2 Member Function Documentation

6.58.2.1 `virtual cms::Destination* ac-
tivemq::commands::ActiveMQTempQueue::clone () const
[inline, virtual]`

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p. 1191).

6.58.2.2 `virtual ActiveMQTempQueue* ac-
tivemq::commands::ActiveMQTempQueue::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 400).

6.58.2.3 `virtual void activemq::commands::ActiveMQTempQueue::copy (const
cms::Destination & source) [inline, virtual]`

Copies the contents of the given Destination object to this one.

Parameters:

source The source Destination object.

6.58.2.4 `virtual void activemq::commands::ActiveMQTempQueue::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::ActiveMQTempDestination` (p. 400).

6.58.2.5 `virtual void activemq::commands::ActiveMQTempQueue::destroy () throw (cms::CMSException) [inline, virtual]`

Destroy's the Temp Destination at the Broker.

Exceptions:

CMSException

Implements `cms::TemporaryQueue` (p. 2538).

References AMQ_CATCH_ALL_THROW_CMSEXCEPTION.

6.58.2.6 `virtual bool activemq::commands::ActiveMQTempQueue::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::ActiveMQTempDestination` (p. 401).

6.58.2.7 `virtual const cms::Destination* activemq::commands::ActiveMQTempQueue::getCMSDestination () const [inline, virtual]`

Returns:

the `cms::Destination` (p. 1190) interface pointer that the objects that derive from this class implement.

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 233).

6.58.2.8 `virtual const cms::CMSProperties& activemq::commands::ActiveMQTempQueue::getCMSPProperties () const [inline, virtual]`

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

const reference to a properties object.

Implements **cms::Destination** (p. 1191).

6.58.2.9 `virtual unsigned char activemq::commands::ActiveMQTempQueue::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 401).

6.58.2.10 `virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempQueue::getDestinationType () const [inline, virtual]`

Retrieve the Destination Type for this Destination.

Returns:

The Destination Type

Implements **activemq::commands::ActiveMQDestination** (p. 234).

References cms::Destination::TEMPORARY_QUEUE.

6.58.2.11 `virtual std::string activemq::commands::ActiveMQTempQueue::getQueueName () const throw (cms::CMSException) [inline, virtual]`

Gets the name of this queue.

Returns:

The queue name.

Implements **cms::TemporaryQueue** (p. 2539).

6.58.2.12 `virtual std::string activemq::commands::ActiveMQTempQueue::toString () const [virtual]`

Converts the Destination Name into a String.

Returns:

string name

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 401).

6.58.3 Field Documentation

Public Member Functions

- **ActiveMQTempQueueMarshaller** ()
- virtual **~ActiveMQTempQueueMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.59.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempQueueMarshaller** (p. 420).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.59.2 Constructor & Destructor Documentation

6.59.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::ActiveMQTempQueueMarshaller()` `[inline]`

6.59.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::~~ActiveMQTempQueueMarshaller()` `[inline, virtual]`

6.59.3 Member Function Documentation

6.59.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.59.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.59.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller` (p. 404).

6.59.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller` (p. 404).

6.59.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller` (p. 405).

6.59.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 405).

6.59.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 406).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.60.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempQueueMarshaller** (p. 424).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.60.2 Constructor & Destructor Documentation

6.60.2.1 `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::ActiveMQTempQueueMarshaller()` `[inline]`

6.60.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::~~ActiveMQTempQueueMarshaller()` `[inline, virtual]`

6.60.3 Member Function Documentation

6.60.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.60.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.60.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 408).

6.60.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 408).

6.60.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 409).

6.60.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 409).

6.60.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 410).

The documentation for this class was generated from the following file:

6.61.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempQueueMarshaller** (p. 428).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.61.2 Constructor & Destructor Documentation

6.61.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::ActiveMQTempQueueMarshaller()` `[inline]`

6.61.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::~~ActiveMQTempQueueMarshaller()` `[inline, virtual]`

6.61.3 Member Function Documentation

6.61.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.61.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.61.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 412).

6.61.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 412).

6.61.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 413).

6.61.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller** (p. 413).

6.61.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTempQueueMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller** (p. 414).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ActiveMQTempQueueMarshaller.h`

6.62 activemq::commands::ActiveMQTempTopic Class Reference

#include <src/main/activemq/commands/ActiveMQTempTopic.h> Inheritance diagram for activemq::commands::ActiveMQTempTopic:

Public Member Functions

- **ActiveMQTempTopic** ()
- **ActiveMQTempTopic** (const std::string &name)
- virtual ~**ActiveMQTempTopic** ()

*Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTempTopic** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
Converts the Destination Name into a String.
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const **cms::Destination** * **getCMSDestination** () const
- virtual **cms::Destination::DestinationType** **getDestinationType** () const
Retrieve the Destination Type for this Destination.
- virtual **cms::Destination** * **clone** () const
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const **cms::Destination** &source)
Copies the contents of the given Destinastion object to this one.
- virtual const **cms::CMSProperties** & **getCMSProperties** () const
Retrieve any properties that might be part of the destination that was specified.
- virtual std::string **getTopicName** () const throw (cms::CMSException)
Gets the name of this topic.
- virtual void **destroy** () throw (cms::CMSException)
Destroy's the Temp Destination at the Broker.

Static Public Attributes

- static const unsigned char **ID_**ACTIVEMQTEMPTOPIC = 103

6.62.1 Constructor & Destructor Documentation

6.62.1.1 `activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic ()`

6.62.1.2 `activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic (const std::string & name)`

6.62.1.3 `virtual
activemq::commands::ActiveMQTempTopic::~~ActiveMQTempTopic ()
[virtual]`

6.62.2 Member Function Documentation

6.62.2.1 `virtual cms::Destination* ac-
tivemq::commands::ActiveMQTempTopic::clone () const
[inline, virtual]`

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p. 1191).

6.62.2.2 `virtual ActiveMQTempTopic* ac-
tivemq::commands::ActiveMQTempTopic::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 400).

6.62.2.3 `virtual void activemq::commands::ActiveMQTempTopic::copy (const cms::Destination & source) [inline, virtual]`

Copies the contents of the given Destination object to this one.

Parameters:

source The source Destination object.

6.62.2.4 `virtual void activemq::commands::ActiveMQTempTopic::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::ActiveMQTempDestination` (p. 400).

6.62.2.5 `virtual void activemq::commands::ActiveMQTempTopic::destroy () throw (cms::CMSException) [inline, virtual]`

Destroy's the Temp Destination at the Broker.

Exceptions:

CMSException

Implements `cms::TemporaryTopic` (p. 2540).

References `AMQ_CATCH_ALL_THROW_CMSEXCEPTION`.

6.62.2.6 `virtual bool activemq::commands::ActiveMQTempTopic::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::ActiveMQTempDestination` (p. 401).

6.62.2.7 `virtual const cms::Destination* activemq::commands::ActiveMQTempTopic::getCMSDestination () const [inline, virtual]`

Returns:

the `cms::Destination` (p. 1190) interface pointer that the objects that derive from this class implement.

Reimplemented from `activemq::commands::ActiveMQDestination` (p. 233).

6.62.2.8 `virtual const cms::CMSPProperties& activemq::commands::ActiveMQTempTopic::getCMSPProperties () const [inline, virtual]`

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

const reference to a properties object.

Implements **cms::Destination** (p. 1191).

6.62.2.9 `virtual unsigned char activemq::commands::ActiveMQTempTopic::getDataStructureType () const [virtual]`

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 401).

6.62.2.10 `virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempTopic::getDestinationType () const [inline, virtual]`

Retrieve the Destination Type for this Destination.

Returns:

The Destination Type

Implements **activemq::commands::ActiveMQDestination** (p. 234).

References cms::Destination::TEMPORARY_TOPIC.

6.62.2.11 `virtual std::string activemq::commands::ActiveMQTempTopic::getTopicName () const throw (cms::CMSException) [inline, virtual]`

Gets the name of this topic.

Returns:

The topic name.

Implements **cms::TemporaryTopic** (p. 2541).

6.62.2.12 `virtual std::string activemq::commands::ActiveMQTempTopic::toString () const [virtual]`

Converts the Destination Name into a String.

Returns:

string name

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 401).

6.62.3 Field Documentation

6.62.3.1 `const unsigned char activemq::commands::ActiveMQTempTopic::ID _ - ACTIVEMQTEMPTOPIC = 103` [static]

The documentation for this class was generated from the following file:

Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.63.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 437). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.63.2 Constructor & Destructor Documentation

6.63.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::ActiveMQTempTopicMarshaller()` [inline]

6.63.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::~~ActiveMQTempTopicMarshaller()` [inline, virtual]

6.63.3 Member Function Documentation

6.63.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.63.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.63.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 404).

6.63.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::looseUnmarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 404).

6.63.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::tightMarshal1
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 405).

```

6.63.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::tightMarshal2
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 405).

```

6.63.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller::tightUnmarshal
    (OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
    * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQTempDestinationMarshaller** (p. 406).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**ActiveMQTempTopicMarshaller.h**

6.64 activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopic Class Reference

Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 441).

Write a object instance to data output stream.

6.64.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 441). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.64.2 Constructor & Destructor Documentation

6.64.2.1 `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::ActiveMQTempTopicMarshaller()` [inline]

6.64.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::~~ActiveMQTempTopicMarshaller()` [inline, virtual]

6.64.3 Member Function Documentation

6.64.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.64.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.64.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 408).

6.64.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 408).

6.64.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 409).

```

6.64.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::tightMarshal2
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 409).

```

6.64.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller::tightUnmarshal
    (OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
    * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 410).

The documentation for this class was generated from the following file:

6.65.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 445). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.65.2 Constructor & Destructor Documentation

6.65.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::ActiveMQTempTopicMarshaller()` [inline]

6.65.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::~~ActiveMQTempTopicMarshaller()` [inline, virtual]

6.65.3 Member Function Documentation

6.65.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.65.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.65.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 412).

6.65.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 412).

6.65.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller` (p. 413).

```

6.65.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::tightMarshal2
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller** (p. 413).

```

6.65.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ActiveMQTempTopicMarshaller::tightUnmarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQTempDestinationMarshaller** (p. 414).

The documentation for this class was generated from the following file:

6.66 activemq::commands::ActiveMQTextMessage Class Reference

#include <src/main/activemq/commands/ActiveMQTextMessage.h> Inheritance diagram for activemq::commands::ActiveMQTextMessage:

Public Member Functions

- **ActiveMQTextMessage** ()
- virtual **~ActiveMQTextMessage** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ActiveMQTextMessage * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual **cms::TextMessage * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual std::string **getText** () const throw (cms::CMSException)
Gets the message character buffer.
- virtual void **setText** (const char *msg) throw (cms::CMSException)
Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- virtual void **setText** (const std::string &msg) throw (cms::CMSException)
Sets the message contents.

Static Public Attributes

- static const unsigned char **ID _ACTIVEMQTEXTMESSAGE** = 28

6.66.1 Constructor & Destructor Documentation

6.66.1.1 `activemq::commands::ActiveMQTextMessage::ActiveMQTextMessage ()`

6.66.1.2 `virtual
activemq::commands::ActiveMQTextMessage::~~ActiveMQTextMessage ()
[virtual]`

6.66.2 Member Function Documentation

6.66.2.1 `virtual cms::TextMessage* ac-
tivemq::commands::ActiveMQTextMessage::clone () const
[inline, virtual]`

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implements `cms::Message` (p.1758).

6.66.2.2 `virtual ActiveMQTextMessage* ac-
tivemq::commands::ActiveMQTextMessage::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from `activemq::commands::Message` (p.1741).

6.66.2.3 `virtual void ac-
tivemq::commands::ActiveMQTextMessage::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from `activemq::commands::Message` (p.1742).

6.66.2.4 `virtual bool activemq::commands::ActiveMQTextMessage::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p.1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Message` (p. 1742).

6.66.2.5 `virtual unsigned char activemq::commands::ActiveMQTextMessage::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new `DataStructure` (p. 1174) type copy.

Reimplemented from `activemq::commands::Message` (p. 1743).

6.66.2.6 `virtual std::string activemq::commands::ActiveMQTextMessage::getText () const throw (cms::CMSEException) [virtual]`

Gets the message character buffer.

Returns:

The message character buffer.

Implements `cms::TextMessage` (p. 2542).

6.66.2.7 `virtual void activemq::commands::ActiveMQTextMessage::setText (const std::string & msg) throw (cms::CMSEException) [virtual]`

Sets the message contents.

Parameters:

msg The message buffer.

Implements `cms::TextMessage` (p. 2543).

6.66.2.8 `virtual void activemq::commands::ActiveMQTextMessage::setText (const char * msg) throw (cms::CMSEException) [virtual]`

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters:

msg The message buffer.

Implements `cms::TextMessage` (p. 2543).

6.66.2.9 `virtual std::string activemq::commands::ActiveMQTextMessage::toString()` `const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::Message` (p.1749).

6.66.3 Field Documentation

6.66.3.1 `const unsigned char activemq::commands::ActiveMQTextMessage::ID_ - ACTIVEMQTEXTMESSAGE = 28` [static]

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.67.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 453).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.67.2 Constructor & Destructor Documentation

6.67.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::ActiveMQTextMessageMarshaller()` [inline]

6.67.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::~~ActiveMQTextMessageMarshaller()` [inline, virtual]

6.67.3 Member Function Documentation

6.67.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::createObject(const commands::DataStructure& dataStructure) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.67.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.67.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::looseMarshal(const commands::DataStructure& dataStructure, decaf::io::DataOutputStream& dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.67.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867).

6.67.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1868).

6.67.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

6.67.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::MessageMarshaller** (p. 1869).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ActiveMQTextMessageMarshaller.h`

6.68 activemq:wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 457).

Write a object instance to data output stream.

6.68.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 457).
NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.68.2 Constructor & Destructor Documentation

6.68.2.1 `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::ActiveMQTextMessageMarshaller()` [inline]

6.68.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::~~ActiveMQTextMessageMarshaller()` [inline, virtual]

6.68.3 Member Function Documentation

6.68.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::createObject(const commands::DataStructure& dataStructure) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.68.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.68.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::looseMarshal(const commands::DataStructure& dataStructure, const OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.68.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872).

6.68.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1873).

6.68.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

6.68.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::MessageMarshaller** (p. 1874).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.69.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 461).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.69.2 Constructor & Destructor Documentation

6.69.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::ActiveMQTextMessageMarshaller()` [inline]

6.69.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::~~ActiveMQTextMessageMarshaller()` [inline, virtual]

6.69.3 Member Function Documentation

6.69.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::createObject(const commands::DataStructure& dataStructure) const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.69.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.69.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::looseMarshal(const commands::DataStructure& dataStructure, decaf::io::DataOutputStream& dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.69.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862).

6.69.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1863).

6.69.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

6.69.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::MessageMarshaller** (p. 1864).

- virtual **ActiveMQTopic** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*
- virtual const cms::Destination * **getCMSDestination** () const
- virtual cms::Destination::DestinationType **getDestinationType** () const
Retrieve the Destination Type for this Destination.
- virtual cms::Destination * **clone** () const
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const cms::Destination &source)
Copies the contents of the given Destination object to this one.
- virtual const cms::CMSProperties & **getCMSProperties** () const
Retrieve any properties that might be part of the destination that was specified.
- virtual std::string **getTopicName** () const throw (cms::CMSException)
Gets the name of this topic.

Static Public Attributes

- static const unsigned char **ID_ACTIVEMQTOPIC** = 101

6.70.1 Constructor & Destructor Documentation

6.70.1.1 `activemq::commands::ActiveMQTopic::ActiveMQTopic ()`

6.70.1.2 `activemq::commands::ActiveMQTopic::ActiveMQTopic (const std::string & name)`

6.70.1.3 `virtual activemq::commands::ActiveMQTopic::~~ActiveMQTopic ()`
[virtual]

6.70.2 Member Function Documentation

6.70.2.1 `virtual cms::Destination* activemq::commands::ActiveMQTopic::clone ()`
`const` [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implements **cms::Destination** (p.1191).

6.70.2.2 `virtual ActiveMQTopic* activemq::commands::ActiveMQTopic::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p.231).

6.70.2.3 `virtual void activemq::commands::ActiveMQTopic::copy (const cms::Destination & source)` [inline, virtual]

Copies the contents of the given Destination object to this one.

Parameters:

source The source Destination object.

6.70.2.4 `virtual void activemq::commands::ActiveMQTopic::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::ActiveMQDestination** (p.232).

6.70.2.5 virtual bool activemq::commands::ActiveMQTopic::equals (const DataStructure * *value*) const [inline, virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

References **activemq::commands::ActiveMQDestination::equals()**.

6.70.2.6 virtual const cms::Destination* activemq::commands::ActiveMQTopic::getCMSDestination () const [inline, virtual]

Returns:

the **cms::Destination** (p. 1190) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

6.70.2.7 virtual const cms::CMSProperties& activemq::commands::ActiveMQTopic::getCMSProperties () const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

const reference to a properties object.

Implements **cms::Destination** (p. 1191).

6.70.2.8 virtual unsigned char activemq::commands::ActiveMQTopic::getDataStructureType () const [virtual]

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 233).

6.70.2.9 virtual cms::Destination::DestinationType activemq::commands::ActiveMQTopic::getDestinationType () const [inline, virtual]

Retrieve the Destination Type for this Destination.

Returns:

The Destination Type

Implements **activemq::commands::ActiveMQDestination** (p. 234).

References **cms::Destination::TOPIC**.

6.70.2.10 **virtual std::string activemq::commands::ActiveMQTopic::getTopicName
() const throw (cms::CMSException) [inline, virtual]**

Gets the name of this topic.

Returns:

The topic name.

Implements **cms::Topic** (p. 2571).

6.70.2.11 **virtual std::string activemq::commands::ActiveMQTopic::toString ()
const [virtual]**

Returns a string containing the information for this **DataSet** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 237).

6.70.3 Field Documentation

6.70.3.1 **const unsigned char activemq::commands::ActiveMQTopic::ID_ -
ACTIVEMQTOPIC = 101 [static]**

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ActiveMQTopic.h`

6.71 activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 469).

Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.71.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 469). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.71.2 Constructor & Destructor Documentation

6.71.2.1 `activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::ActiveMQTopicMarshaller()` [inline]

6.71.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::~~ActiveMQTopicMarshaller()` [inline, virtual]

6.71.3 Member Function Documentation

6.71.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.71.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.71.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 241).

6.71.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 241).

6.71.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 242).

```

6.71.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::tightMarshal2
(OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 242).

```

6.71.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller::tightUnmarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
* bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ActiveMQDestinationMarshaller** (p. 243).

The documentation for this class was generated from the following file:

6.72.3 Member Function Documentation

6.72.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.72.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.72.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 245).

6.72.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 245).

6.72.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 246).

```

6.72.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller::tightMarshal2
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 246).

```

6.72.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller::tightUnmarshal
    (OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
    * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 247).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**ActiveMQTopicMarshaller.h**

6.73 activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 477).

#include <src/main/activemq/wireformat/openwire/marshal/v2/ActiveMQTopicMarshaller.h>Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller:

Public Member Functions

- **ActiveMQTopicMarshaller** ()
- virtual **~ActiveMQTopicMarshaller** ()

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.73.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 477). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.73.2 Constructor & Destructor Documentation

6.73.2.1 `activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::ActiveMQTopicMarshaller()` [inline]

6.73.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::~~ActiveMQTopicMarshaller()` [inline, virtual]

6.73.3 Member Function Documentation

6.73.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.73.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.73.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 249).

6.73.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 249).

6.73.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 250).

```

6.73.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::tightMarshal2
    (OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 250).

```

6.73.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v2::ActiveMQTopicMarshaller::tightUnmarshal
    (OpenWireFormat * wireFormat, commands::DataStructure *
    dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream
    * bs) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ActiveMQDestinationMarshaller** (p. 251).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**ActiveMQTopicMarshaller.h**

6.74 activemq::core::ActiveMQTransactionContext Class Reference

Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.

```
#include <src/main/activemq/core/ActiveMQTransactionContext.h>
```

Public Member Functions

- **ActiveMQTransactionContext** (**ActiveMQSession** *session, const **decaf::util::Properties** &properties)
Constructor.
- virtual **~ActiveMQTransactionContext** ()
- virtual void **addSynchronization** (const **Pointer**< **Synchronization** > &sync)
*Adds a **Synchronization** (p. 2516) to this Transaction.*
- virtual void **removeSynchronization** (const **Pointer**< **Synchronization** > &sync)
*Removes a **Synchronization** (p. 2516) to this Transaction.*
- virtual void **begin** () throw (exceptions::ActiveMQException)
Begins a new transaction if one is not currently in progress.
- virtual void **commit** () throw (exceptions::ActiveMQException)
Commit the current Transaction.
- virtual void **rollback** () throw (exceptions::ActiveMQException)
Rollback the current Transaction.
- virtual const **decaf::lang::Pointer**< **commands::TransactionId** > & **getTransactionId** () const
Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.
- virtual bool **isInTransaction** () const
Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.
- int **getMaximumRedeliveries** () const
- long **getRedeliveryDelay** () const

6.74.1 Detailed Description

Transaction Management class, hold messages that are to be redelivered upon a request to roll-back. The Transaction represents an always running transaction, when it is committed or rolled back it silently creates a new transaction for the next set of messages. The only way to permanently end this transaction is to delete it.

Configuration options

transaction.maxRedeliveryCount Max number of times a message can be re-delivered, if the session is rolled back more than this many time, the message is dropped.

6.74.2 Constructor & Destructor Documentation

6.74.2.1 `activemq::core::ActiveMQTransactionContext::ActiveMQTransactionContext (ActiveMQSession * session, const decaf::util::Properties & properties)`

Constructor.

Parameters:

session - the session that contains this transaction

properties - configuration parameters for this object

6.74.2.2 `virtual activemq::core::ActiveMQTransactionContext::~ActiveMQTransactionContext () [virtual]`

6.74.3 Member Function Documentation

6.74.3.1 `virtual void activemq::core::ActiveMQTransactionContext::addSynchronization (const Pointer< Synchronization > & sync) [virtual]`

Adds a **Synchronization** (p. 2516) to this Transaction.

Parameters:

sync - The **Synchronization** (p. 2516) instance to add.

6.74.3.2 `virtual void activemq::core::ActiveMQTransactionContext::begin () throw (exceptions::ActiveMQException) [virtual]`

Begins a new transaction if one is not currently in progress.

Exceptions:

ActiveMQException

6.74.3.3 `virtual void activemq::core::ActiveMQTransactionContext::commit () throw (exceptions::ActiveMQException) [virtual]`

Commit the current Transaction.

Exceptions:

ActiveMQException

6.74.3.4 `int activemq::core::ActiveMQTransactionContext::getMaximumRedeliveries () const [inline]`

6.74.3.5 `long long activemq::core::ActiveMQTransactionContext::getRedeliveryDelay () const [inline]`

6.74.3.6 `virtual const decaf::lang::Pointer<commands::TransactionId>& activemq::core::ActiveMQTransactionContext::getTransactionId () const [inline, virtual]`

Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.

Returns:

TransactionInfo

Exceptions:

InvalidStateException if a Transaction is not in progress.

6.74.3.7 `virtual bool activemq::core::ActiveMQTransactionContext::isInTransaction () const [inline, virtual]`

Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.

Returns:

true if a transaction is in progress.

6.74.3.8 `virtual void activemq::core::ActiveMQTransactionContext::removeSynchronization (const Pointer< Synchronization > & sync) [virtual]`

Removes a **Synchronization** (p. 2516) to this Transaction.

Parameters:

sync - The **Synchronization** (p. 2516) instance to add.

6.74.3.9 `virtual void activemq::core::ActiveMQTransactionContext::rollback () throw (exceptions::ActiveMQException) [virtual]`

Rollback the current Transaction.

Exceptions:

ActiveMQException

The documentation for this class was generated from the following file:

- src/main/activemq/core/ActiveMQTransactionContext.h

6.75 decaf::lang::Appendable Class Reference

#include <src/main/decaf/lang/Appendable.h> Inheritance diagram for decaf::lang::Appendable:

Public Member Functions

- virtual **~Appendable** ()
- virtual **Appendable & append** (char value)=0 throw (decaf::lang::Exception)
*Appends the specified character to this **Appendable** (p. 484).*
- virtual **Appendable & append** (const **CharSequence** *csq)=0 throw (decaf::lang::Exception)
*Appends the specified character sequence to this **Appendable** (p. 484).*
- virtual **Appendable & append** (const **CharSequence** *csq, std::size_t start, std::size_t end)=0 throw (decaf::lang::Exception)
*Appends a subsequence of the specified character sequence to this **Appendable** (p. 484).*

6.75.1 Constructor & Destructor Documentation

6.75.1.1 virtual decaf::lang::Appendable::~~Appendable () [inline, virtual]

6.75.2 Member Function Documentation

6.75.2.1 virtual Appendable& decaf::lang::Appendable::append (const **CharSequence** * *csq*, std::size_t *start*, std::size_t *end*) throw (decaf::lang::Exception) [pure virtual]

Appends a subsequence of the specified character sequence to this **Appendable** (p. 484).

Parameters:

- csq* - The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".
- start* - The index of the first character in the subsequence
- end* - The index of the character following the last character in the subsequence

Returns:

a Reference to this **Appendable** (p. 484)

Exceptions:

- Exception* (p. 1268) if an error occurs.
- IndexOutOfBoundsException* start is greater than end, or end is greater than csq.length()

Implemented in **decaf::nio::CharBuffer** (p. 820).

6.75.2.2 virtual Appendable& decaf::lang::Appendable::append (const CharSequence * *csq*) throw (decaf::lang::Exception) [pure virtual]

Appends the specified character sequence to this **Appendable** (p. 484).

Parameters:

csq - The character sequence from which a subsequence will be appended. If *csq* is NULL, then characters will be appended as if *csq* contained the string "null".

Returns:

a Reference to this **Appendable** (p. 484)

Exceptions:

Exception (p. 1268) if an error occurs.

Implemented in **decaf::nio::CharBuffer** (p. 821).

6.75.2.3 virtual Appendable& decaf::lang::Appendable::append (char *value*) throw (decaf::lang::Exception) [pure virtual]

Appends the specified character to this **Appendable** (p. 484).

Parameters:

value - The character to append

Returns:

a Reference to this **Appendable** (p. 484)

Exceptions:

Exception (p. 1268) if an error occurs.

Implemented in **decaf::nio::CharBuffer** (p. 821).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Appendable.h**

6.76 decaf::internal::AprPool Class Reference

Wraps an APR pool object so that classes in **decaf** (p. 94) can create a static member for use in static methods where apr function calls that need a pool are made.

```
#include <src/main/decaf/internal/AprPool.h>
```

Public Member Functions

- **AprPool** ()
- virtual **~AprPool** ()
- **apr_pool_t * getAprPool** () const
*Gets the **internal** (p. 95) APR Pool.*
- void **cleanup** ()
Clears data that was allocated by this pool.

Static Public Member Functions

- static **apr_pool_t * getGlobalPool** ()
Gets a pointer to the Global APR Pool used for the Application.

6.76.1 Detailed Description

Wraps an APR pool object so that classes in **decaf** (p. 94) can create a static member for use in static methods where apr function calls that need a pool are made.

6.76.2 Constructor & Destructor Documentation

6.76.2.1 decaf::internal::AprPool::AprPool ()

6.76.2.2 virtual decaf::internal::AprPool::~~AprPool () [virtual]

6.76.3 Member Function Documentation

6.76.3.1 void decaf::internal::AprPool::cleanup ()

Clears data that was allocated by this pool. Users should call this after getting the data from the APR functions and copying it to someplace safe.

6.76.3.2 apr_pool_t* decaf::internal::AprPool::getAprPool () const

Gets the **internal** (p. 95) APR Pool.

Returns:

the **internal** (p. 95) APR pool

6.76.3.3 static apr_pool_t* decaf::internal::AprPool::getGlobalPool () [static]

Gets a pointer to the Global APR Pool used for the Application.

Returns:

pointer to the global APR Pool

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**AprPool.h**

6.77 decaf::util::concurrent::atomic::AtomicBoolean Class Reference

A boolean value that may be updated atomically.

```
#include <src/main/decaf/util/concurrent/atomic/AtomicBoolean.h>
```

Public Member Functions

- **AtomicBoolean** ()
*Creates a new **AtomicBoolean** (p. 488) whose initial value is false.*
- **AtomicBoolean** (bool initialValue)
*Creates a new **AtomicBoolean** (p. 488) with the initial value.*
- virtual ~**AtomicBoolean** ()
- bool **get** () const
*Gets the current value of this **AtomicBoolean** (p. 488).*
- void **set** (bool newValue)
Unconditionally sets to the given value.
- bool **compareAndSet** (bool expect, bool update)
Atomically sets the value to the given updated value if the current value == the expected value.
- bool **getAndSet** (bool newValue)
Atomically sets to the given value and returns the previous value.
- std::string **toString** () const
Returns the String representation of the current value.

6.77.1 Detailed Description

A boolean value that may be updated atomically. An **AtomicBoolean** (p. 488) is used in applications such as atomically updated flags, and cannot be used as a replacement for a Boolean.

6.77.2 Constructor & Destructor Documentation

6.77.2.1 decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean ()

Creates a new **AtomicBoolean** (p. 488) whose initial value is false.

6.77.2.2 decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean (bool initialValue)

Creates a new **AtomicBoolean** (p. 488) with the initial value.

Parameters:

initialValue - The initial value of this boolean.

6.77.2.3 `virtual decaf::util::concurrent::atomic::AtomicBoolean::~~AtomicBoolean ()`
 [inline, virtual]

6.77.3 Member Function Documentation

6.77.3.1 `bool decaf::util::concurrent::atomic::AtomicBoolean::compareAndSet (bool`
 `expect, bool update)`

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters:

expect - the expected value

update - the new value

Returns:

true if successful. False return indicates that the actual value was not equal to the expected value.

6.77.3.2 `bool decaf::util::concurrent::atomic::AtomicBoolean::get () const` [inline]

Gets the current value of this **AtomicBoolean** (p.488).

Returns:

the currently set value.

6.77.3.3 `bool decaf::util::concurrent::atomic::AtomicBoolean::getAndSet (bool`
 `new Value)`

Atomically sets to the given value and returns the previous value.

Parameters:

new Value - the new value

Returns:

the previous value

6.77.3.4 `void decaf::util::concurrent::atomic::AtomicBoolean::set (bool new Value)`
 [inline]

Unconditionally sets to the given value.

Parameters:

new Value - the new value

6.77.3.5 `std::string decaf::util::concurrent::atomic::AtomicBoolean::toString ()`
`const`

Returns the String representation of the current value.

Returns:

the String representation of the current value.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/atomic/AtomicBoolean.h`

6.78 decaf::util::concurrent::atomic::AtomicInteger Class Reference

An int value that may be updated atomically.

#include <src/main/decaf/util/concurrent/atomic/AtomicInteger.h> Inheritance diagram for decaf::util::concurrent::atomic::AtomicInteger:

Public Member Functions

- **AtomicInteger** ()
*Create a new **AtomicInteger** (p. 491) with an initial value of 0.*
- **AtomicInteger** (int initialValue)
*Create a new **AtomicInteger** (p. 491) with the given initial value.*
- virtual **~AtomicInteger** ()
- int **get** () const
Gets the current value.
- void **set** (int newValue)
Sets to the given value.
- int **getAndSet** (int newValue)
Atomically sets to the given value and returns the old value.
- bool **compareAndSet** (int expect, int update)
Atomically sets the value to the given updated value if the current value == the expected value.
- int **getAndIncrement** ()
Atomically increments by one the current value.
- int **getAndDecrement** ()
Atomically decrements by one the current value.
- int **getAndAdd** (int delta)
Atomically adds the given value to the current value.
- int **incrementAndGet** ()
Atomically increments by one the current value.
- int **decrementAndGet** ()
Atomically decrements by one the current value.
- int **addAndGet** (int delta)
Atomically adds the given value to the current value.
- std::string **toString** () const

Returns the String representation of the current value.

- int **intValue** () const

Description copied from class: Number Returns the value of the specified number as an int.

- long long **longValue** () const

Description copied from class: Number Returns the value of the specified number as a long.

- float **floatValue** () const

Description copied from class: Number Returns the value of the specified number as a float.

- double **doubleValue** () const

Description copied from class: Number Returns the value of the specified number as a double.

6.78.1 Detailed Description

An int value that may be updated atomically. An **AtomicInteger** (p. 491) is used in applications such as atomically incremented counters, and cannot be used as a replacement for an Integer. However, this class does extend Number to allow uniform access by tools and utilities that deal with numerically-based classes.

6.78.2 Constructor & Destructor Documentation

6.78.2.1 `decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger ()`

Create a new **AtomicInteger** (p. 491) with an initial value of 0.

6.78.2.2 `decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger (int initialValue)`

Create a new **AtomicInteger** (p. 491) with the given initial value.

Parameters:

initialValue - The initial value of this object.

6.78.2.3 `virtual decaf::util::concurrent::atomic::AtomicInteger::~~AtomicInteger ()` [inline, virtual]

6.78.3 Member Function Documentation

6.78.3.1 `int decaf::util::concurrent::atomic::AtomicInteger::addAndGet (int delta)`

Atomically adds the given value to the current value.

Parameters:

delta - the value to add.

Returns:

the updated value.

6.78.3.2 `bool decaf::util::concurrent::atomic::AtomicInteger::compareAndSet (int expect, int update)`

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters:

expect - the expected value

update - the new value

Returns:

true if successful. False return indicates that the actual value was not equal to the expected value.

6.78.3.3 `int decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet ()`

Atomically decrements by one the current value.

Returns:

the updated value.

Referenced by `decaf::lang::AtomicRefCounter::release()`.

6.78.3.4 `double decaf::util::concurrent::atomic::AtomicInteger::doubleValue () const [virtual]`

Description copied from class: `Number` Returns the value of the specified number as a double. This may involve rounding.

Returns:

the numeric value represented by this object after conversion to type double.

Implements `decaf::lang::Number` (p. 1955).

6.78.3.5 `float decaf::util::concurrent::atomic::AtomicInteger::floatValue () const [virtual]`

Description copied from class: `Number` Returns the value of the specified number as a float. This may involve rounding.

Returns:

the numeric value represented by this object after conversion to type float.

Implements `decaf::lang::Number` (p. 1955).

6.78.3.6 `int decaf::util::concurrent::atomic::AtomicInteger::get () const [inline]`

Gets the current value.

Returns:

the current value.

6.78.3.7 `int decaf::util::concurrent::atomic::AtomicInteger::getAndAdd (int delta)`

Atomically adds the given value to the current value.

Parameters:

delta - The value to add.

Returns:

the previous value.

6.78.3.8 `int decaf::util::concurrent::atomic::AtomicInteger::getAndDecrement ()`

Atomically decrements by one the current value.

Returns:

the previous value.

6.78.3.9 `int decaf::util::concurrent::atomic::AtomicInteger::getAndIncrement ()`

Atomically increments by one the current value.

Returns:

the previous value.

6.78.3.10 `int decaf::util::concurrent::atomic::AtomicInteger::getAndSet (int new Value)`

Atomically sets to the given value and returns the old value.

Parameters:

new Value - the new value.

Returns:

the previous value.

6.78.3.11 int decaf::util::concurrent::atomic::AtomicInteger::incrementAndGet ()

Atomically increments by one the current value.

Returns:

the updated value.

Referenced by `decaf::lang::AtomicRefCounter::AtomicRefCounter()`.

6.78.3.12 int decaf::util::concurrent::atomic::AtomicInteger::intValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as an int. This may involve rounding or truncation.

Returns:

the numeric value represented by this object after conversion to type int.

Implements **decaf::lang::Number** (p. 1955).

6.78.3.13 long long decaf::util::concurrent::atomic::AtomicInteger::longValue () const [virtual]

Description copied from class: Number Returns the value of the specified number as a long. This may involve rounding or truncation.

Returns:

the numeric value represented by this object after conversion to type long long.

Implements **decaf::lang::Number** (p. 1955).

6.78.3.14 void decaf::util::concurrent::atomic::AtomicInteger::set (int *newValue*) [inline]

Sets to the given value.

Parameters:

newValue - the new value

6.78.3.15 std::string decaf::util::concurrent::atomic::AtomicInteger::toString () const

Returns the String representation of the current value.

Returns:

the String representation of the current value.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/atomic/AtomicInteger.h`

6.79 decaf::lang::AtomicRefCounter Class Reference

#include <src/main/decaf/lang/Pointer.h> Inheritance diagram for decaf::lang::AtomicRefCounter:

Public Member Functions

- **AtomicRefCounter** ()
- **AtomicRefCounter** (const **AtomicRefCounter** &other)
- void **swap** (**AtomicRefCounter** &other)

Swaps this instance's reference counter with the one given, this allows for copy-and-swap semantics of this object.
- bool **release** ()

*Removes a reference to the counter Atomically and returns if the counter has reached zero, once the counter hits zero, the **internal** (p. 95) counter is destroyed and this instance is now considered to be unreferenced.*

6.79.1 Constructor & Destructor Documentation

6.79.1.1 decaf::lang::AtomicRefCounter::AtomicRefCounter () [inline]

6.79.1.2 decaf::lang::AtomicRefCounter::AtomicRefCounter (const **AtomicRefCounter** & *other*) [inline]

References decaf::util::concurrent::atomic::AtomicInteger::incrementAndGet().

6.79.2 Member Function Documentation

6.79.2.1 bool decaf::lang::AtomicRefCounter::release () [inline]

Removes a reference to the counter Atomically and returns if the counter has reached zero, once the counter hits zero, the **internal** (p. 95) counter is destroyed and this instance is now considered to be unreferenced.

Returns:

true if the count is now zero.

References decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet().

6.79.2.2 void decaf::lang::AtomicRefCounter::swap (**AtomicRefCounter** & *other*) [inline]

Swaps this instance's reference counter with the one given, this allows for copy-and-swap semantics of this object.

Parameters:

other The value to swap with this one's.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Pointer.h**

6.80 decaf::util::concurrent::atomic::AtomicReference< T > Class Template Reference

An Pointer reference that may be updated atomically.

```
#include <src/main/decaf/util/concurrent/atomic/AtomicReference.h>
```

Public Member Functions

- **AtomicReference** ()
- **AtomicReference** (T *value)
- virtual ~**AtomicReference** ()
- T * **get** () const

Gets the Current Value.

- void **set** (T *newValue)

Sets the Current value of this Reference.

- bool **compareAndSet** (T *expect, T *update)

Atomically sets the value to the given updated value if the current value == the expected value.

- T * **getAndSet** (T *newValue)

Atomically sets to the given value and returns the old value.

- std::string **toString** () const

Returns the String representation of the current value.

6.80.1 Detailed Description

```
template<typename T> class decaf::util::concurrent::atomic::AtomicReference< T >
```

An Pointer reference that may be updated atomically.

6.80.2 Constructor & Destructor Documentation

6.80.2.1 `template<typename T> decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference () [inline]`

6.80.2.2 `template<typename T> decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference (T * value) [inline]`

6.80.2.3 `template<typename T> virtual decaf::util::concurrent::atomic::AtomicReference< T >::~~AtomicReference () [inline, virtual]`

6.80.3 Member Function Documentation

6.80.3.1 `template<typename T> bool decaf::util::concurrent::atomic::AtomicReference< T >::compareAndSet (T * expect, T * update) [inline]`

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters:

expect - the expected value

update - the new value

Returns:

true if successful. False return indicates that the actual value was not equal to the expected value.

6.80.3.2 `template<typename T> T* decaf::util::concurrent::atomic::AtomicReference< T >::get () const [inline]`

Gets the Current Value.

Returns:

the current value of this Reference.

6.80.3.3 `template<typename T> T* decaf::util::concurrent::atomic::AtomicReference< T >::getAndSet (T * new Value) [inline]`

Atomically sets to the given value and returns the old value.

Parameters:

new Value- the new value

Returns:

the previous value.

6.80.3.4 `template<typename T > void
decaf::util::concurrent::atomic::AtomicReference< T >::set
(T * newValue) [inline]`

Sets the Current value of this Reference.

Parameters:

newValue The new Value of this Reference.

6.80.3.5 `template<typename T > std::string
decaf::util::concurrent::atomic::AtomicReference< T
>::toString () const [inline]`

Returns the String representation of the current value.

Returns:

string representation of the current value.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/atomic/AtomicReference.h`

6.81 activemq::transport::failover::BackupTransport Class Reference

#include <src/main/activemq/transport/failover/BackupTransport.h> Inheritance diagram for activemq::transport::failover::BackupTransport:

Public Member Functions

- **BackupTransport** (**BackupTransportPool** *failover)
- virtual **~BackupTransport** ()
- **decaf::net::URI** **getUri** () const
Gets the URI assigned to this Backup.
- void **setUri** (const **decaf::net::URI** &uri)
*Sets the URI assigned to this **Transport** (p. 2608).*
- const **Pointer**< **Transport** > & **getTransport** ()
*Gets the currently held **transport** (p. 67).*
- void **setTransport** (const **Pointer**< **Transport** > &transport)
*Sets the held **transport** (p. 67), if not NULL then start to listen for **exceptions** (p. 62) from the held **transport** (p. 67).*
- virtual void **onException** (const **decaf::lang::Exception** &ex)
*Event handler for an exception from a command **transport** (p. 67).*
- bool **isClosed** () const
*Has the **Transport** (p. 2608) been shutdown and no longer usable.*
- void **setClosed** (bool value)
*Sets the closed flag on this **Transport** (p. 2608).*

6.81.1 Constructor & Destructor Documentation

- 6.81.1.1 **activemq::transport::failover::BackupTransport::BackupTransport** (**BackupTransportPool** * failover)
- 6.81.1.2 virtual **activemq::transport::failover::BackupTransport::~~BackupTransport** () [virtual]

6.81.2 Member Function Documentation

- 6.81.2.1 const **Pointer**<**Transport**>& **activemq::transport::failover::BackupTransport::getTransport** () [inline]

Gets the currently held **transport** (p. 67).

Returns:

pointer to the held **transport** (p. 67) or NULL if not set.

6.81.2.2 `decaf::net::URI activemq::transport::failover::BackupTransport::getUri () const [inline]`

Gets the URI assigned to this Backup.

Returns:

the assigned URI

6.81.2.3 `bool activemq::transport::failover::BackupTransport::isClosed () const [inline]`

Has the **Transport** (p. 2608) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 2608)

6.81.2.4 `virtual void activemq::transport::failover::BackupTransport::onException (const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command **transport** (p. 67). The **BackupTransport** (p. 501) closes its internal **Transport** (p. 2608) when an exception is received and returns the URI to the pool of URIs to attempt connections to.

Parameters:

ex The exception that was passed to this listener to handle.

Implements **activemq::transport::TransportListener** (p. 2625).

6.81.2.5 `void activemq::transport::failover::BackupTransport::setClosed (bool value) [inline]`

Sets the closed flag on this **Transport** (p. 2608).

Parameters:

value - true for closed.

6.81.2.6 `void activemq::transport::failover::BackupTransport::setTransport (const Pointer< Transport > & transport) [inline]`

Sets the held **transport** (p. 67), if not NULL then start to listen for **exceptions** (p. 62) from the held **transport** (p. 67).

Parameters:

transport (p. 67) The **transport** (p. 67) to hold.

6.81.2.7 void activemq::transport::failover::BackupTransport::setUri (const decaf::net::URI & *uri*) [inline]

Sets the URI assigned to this **Transport** (p. 2608).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**BackupTransport.h**

6.82 activemq::transport::failover::BackupTransportPool

Class Reference

#include <src/main/activemq/transport/failover/BackupTransportPool.h> Inheritance diagram for activemq::transport::failover::BackupTransportPool:

Public Member Functions

- **BackupTransportPool** (const **Pointer**< **CompositeTaskRunner** > &taskRunner, const **Pointer**< **CloseTransportsTask** > &closeTask, const **Pointer**< **URIPool** > &uriPool)
- **BackupTransportPool** (int backupPoolSize, const **Pointer**< **CompositeTaskRunner** > &taskRunner, const **Pointer**< **CloseTransportsTask** > &closeTask, const **Pointer**< **URIPool** > &uriPool)
- virtual ~**BackupTransportPool** ()
- virtual bool **isPending** () const
Return true if we don't currently have enough Connected Transports.
- **Pointer**< **BackupTransport** > **getBackup** ()
*Get a Connected **Transport** (p. 2608) from the pool of Backups if any are present, otherwise it return a NULL Pointer.*
- virtual bool **iterate** ()
Connect to a Backup Broker if we haven't already connected to the max number of Backups.
- int **getBackupPoolSize** () const
Gets the Max number of Backups this Task will create.
- void **setBackupPoolSize** (int size)
Sets the Max number of Backups this Task will create.
- bool **isEnabled** () const
*Gets if the backup **Transport** (p. 2608) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.*
- void **setEnabled** (bool value)
*Sets if this Backup **Transport** (p. 2608) Pool is enabled.*

Friends

- class **BackupTransport**

6.82.1 Constructor & Destructor Documentation

6.82.1.1 `activemq::transport::failover::BackupTransportPool::BackupTransportPool (const Pointer< CompositeTaskRunner > & taskRunner, const Pointer< CloseTransportsTask > & closeTask, const Pointer< URIPool > & uriPool)`

6.82.1.2 `activemq::transport::failover::BackupTransportPool::BackupTransportPool (int backupPoolSize, const Pointer< CompositeTaskRunner > & taskRunner, const Pointer< CloseTransportsTask > & closeTask, const Pointer< URIPool > & uriPool)`

6.82.1.3 `virtual
activemq::transport::failover::BackupTransportPool::~~BackupTransportPool
() [virtual]`

6.82.2 Member Function Documentation

6.82.2.1 `Pointer<BackupTransport> ac-
tivemq::transport::failover::BackupTransportPool::getBackup
()`

Get a Connected **Transport** (p. 2608) from the pool of Backups if any are present, otherwise it return a NULL Pointer.

Returns:

Pointer to a Connected **Transport** (p. 2608) or NULL

6.82.2.2 `int ac-
tivemq::transport::failover::BackupTransportPool::getBackupPoolSize ()
const [inline]`

Gets the Max number of Backups this Task will create.

Returns:

the max number of active BackupTransports that will be created.

6.82.2.3 `bool activemq::transport::failover::BackupTransportPool::isEnabled ()
const [inline]`

Gets if the backup **Transport** (p. 2608) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.

Returns:

true if enable.

6.82.2.4 `virtual bool activemq::transport::failover::BackupTransportPool::isPending
() const [virtual]`

Return true if we don't currently have enough Connected Transports.

Implements **activemq::threads::CompositeTask** (p. 906).

6.82.2.5 **virtual bool activemq::transport::failover::BackupTransportPool::iterate ()** [virtual]

Connect to a Backup Broker if we haven't already connected to the max number of Backups.

Implements **activemq::threads::Task** (p. 2520).

6.82.2.6 **void activemq::transport::failover::BackupTransportPool::setBackupPoolSize (int size)** [inline]

Sets the Max number of Backups this Task will create.

Parameters:

size - the max number of active BackupTransports that will be created.

6.82.2.7 **void activemq::transport::failover::BackupTransportPool::setEnabled (bool value)**

Sets if this Backup **Transport** (p. 2608) Pool is enabled. When not enabled no Backups are created and any that were are destroyed.

Parameters:

value - true to enable backup creation, false to disable.

6.83.1 Constructor & Destructor Documentation

6.83.1.1 `activemq::commands::BaseCommand::BaseCommand ()` [inline]

6.83.1.2 `virtual activemq::commands::BaseCommand::~~BaseCommand ()`
[inline, virtual]

6.83.2 Member Function Documentation

6.83.2.1 `virtual void activemq::commands::BaseCommand::copyDataStructure`
`(const DataStructure * src)` [inline, virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented in `activemq::commands::ActiveMQBlobMessage` (p. 147), `activemq::commands::ActiveMQBytesMessage` (p. 167), `activemq::commands::ActiveMQMapMessage` (p. 258), `activemq::commands::ActiveMQMessage` (p. 280), `activemq::commands::ActiveMQObjectMessage` (p. 311), `activemq::commands::ActiveMQStreamMessage` (p. 377), `activemq::commands::ActiveMQTextMessage` (p. 450), `activemq::commands::BrokerError` (p. 587), `activemq::commands::BrokerInfo` (p. 609), `activemq::commands::ConnectionControl` (p. 946), `activemq::commands::ConnectionError` (p. 963), `activemq::commands::ConnectionInfo` (p. 999), `activemq::commands::ConsumerControl` (p. 1029), `activemq::commands::ConsumerInfo` (p. 1064), `activemq::commands::ControlCommand` (p. 1084), `activemq::commands::DataArrayResponse` (p. 1102), `activemq::commands::DataResponse` (p. 1133), `activemq::commands::DestinationInfo` (p. 1195), `activemq::commands::ExceptionResponse` (p. 1277), `activemq::commands::FlushCommand` (p. 1358), `activemq::commands::IntegerResponse` (p. 1443), `activemq::commands::KeepAliveInfo` (p. 1556), `activemq::commands::Message` (p. 1742), `activemq::commands::MessageAck` (p. 1778), `activemq::commands::MessageDispatch` (p. 1801), `activemq::commands::MessageDispatchNotification` (p. 1824), `activemq::commands::MessagePull` (p. 1894), `activemq::commands::ProducerAck` (p. 2087), `activemq::commands::ProducerInfo` (p. 2123), `activemq::commands::RemoveInfo` (p. 2178), `activemq::commands::RemoveSubscriptionInfo` (p. 2194), `activemq::commands::ReplayCommand` (p. 2211), `activemq::commands::Response` (p. 2232), `activemq::commands::SessionInfo` (p. 2301), `activemq::commands::ShutdownInfo` (p. 2350), `activemq::commands::TransactionInfo` (p. 2590), and `activemq::commands::WireFormatInfo` (p. 2702).

References `getCommandId()`, and `isResponseRequired()`.

6.83.2.2 `virtual bool activemq::commands::BaseCommand::equals (const`
`DataStructure * value) const` [inline, virtual]

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 148), **activemq::commands::ActiveMQBytesMessage** (p. 167), **activemq::commands::ActiveMQMapMessage** (p. 259), **activemq::commands::ActiveMQMessage** (p. 280), **activemq::commands::ActiveMQObjectMessage** (p. 311), **activemq::commands::ActiveMQStreamMessage** (p. 377), **activemq::commands::ActiveMQTextMessage** (p. 450), **activemq::commands::BrokerInfo** (p. 609), **activemq::commands::ConnectionControl** (p. 947), **activemq::commands::ConnectionError** (p. 963), **activemq::commands::ConnectionInfo** (p. 999), **activemq::commands::ConsumerControl** (p. 1030), **activemq::commands::ConsumerInfo** (p. 1064), **activemq::commands::ControlCommand** (p. 1084), **activemq::commands::DataArrayResponse** (p. 1102), **activemq::commands::DataResponse** (p. 1133), **activemq::commands::DestinationInfo** (p. 1196), **activemq::commands::ExceptionResponse** (p. 1277), **activemq::commands::FlushCommand** (p. 1358), **activemq::commands::IntegerResponse** (p. 1443), **activemq::commands::KeepAliveInfo** (p. 1556), **activemq::commands::Message** (p. 1742), **activemq::commands::MessageAck** (p. 1779), **activemq::commands::MessageDispatch** (p. 1802), **activemq::commands::MessageDispatchNotification** (p. 1825), **activemq::commands::MessagePull** (p. 1895), **activemq::commands::ProducerAck** (p. 2087), **activemq::commands::ProducerInfo** (p. 2124), **activemq::commands::RemoveInfo** (p. 2178), **activemq::commands::RemoveSubscriptionInfo** (p. 2195), **activemq::commands::ReplayCommand** (p. 2211), **activemq::commands::Response** (p. 2232), **activemq::commands::SessionInfo** (p. 2301), **activemq::commands::ShutdownInfo** (p. 2350), **activemq::commands::TransactionInfo** (p. 2590), and **activemq::commands::WireFormatInfo** (p. 2702).

References **activemq::commands::BaseDataStructure::equals()**.

6.83.2.3 virtual int activemq::commands::BaseCommand::getCommandId () const [inline, virtual]

Gets the **Command** (p. 879) Id of this **Message** (p. 1737).

Returns:

Command (p. 879) Id

Implements **activemq::commands::Command** (p. 880).

Referenced by **copyDataStructure()**.

6.83.2.4 virtual bool activemq::commands::BaseCommand::isBrokerInfo () const [inline, virtual]

Implements **activemq::commands::Command** (p. 880).

Reimplemented in **activemq::commands::BrokerInfo** (p. 611).

6.83.2.5 `virtual bool activemq::commands::BaseCommand::isConnectionInfo () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 880).

Reimplemented in `activemq::commands::ConnectionInfo` (p. 1000).

6.83.2.6 `virtual bool activemq::commands::BaseCommand::isConsumerInfo () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 880).

Reimplemented in `activemq::commands::ConsumerInfo` (p. 1066).

6.83.2.7 `virtual bool activemq::commands::BaseCommand::isKeepAliveInfo () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 880).

Reimplemented in `activemq::commands::KeepAliveInfo` (p. 1557).

6.83.2.8 `virtual bool activemq::commands::BaseCommand::isMessage () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 880).

Reimplemented in `activemq::commands::Message` (p. 1747).

6.83.2.9 `virtual bool activemq::commands::BaseCommand::isMessageAck () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::MessageAck` (p. 1780).

6.83.2.10 `virtual bool activemq::commands::BaseCommand::isMessageDispatch () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::MessageDispatch` (p. 1803).

6.83.2.11 `virtual bool activemq::commands::BaseCommand::isMessageDispatchNotification () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::MessageDispatchNotification` (p. 1826).

6.83.2.12 `virtual bool activemq::commands::BaseCommand::isProducerAck () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::ProducerAck` (p. 2088).

6.83.2.13 `virtual bool activemq::commands::BaseCommand::isProducerInfo () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::ProducerInfo` (p. 2125).

6.83.2.14 `virtual bool activemq::commands::BaseCommand::isRemoveInfo () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::RemoveInfo` (p. 2179).

6.83.2.15 `virtual bool activemq::commands::BaseCommand::isRemoveSubscriptionInfo () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::RemoveSubscriptionInfo` (p. 2196).

6.83.2.16 `virtual bool activemq::commands::BaseCommand::isResponse () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 881).

Reimplemented in `activemq::commands::Response` (p. 2233).

6.83.2.17 `virtual bool activemq::commands::BaseCommand::isResponseRequired () const [inline, virtual]`

Is a **Response** (p. 2231) required for this **Command** (p. 879).

Returns:

true if a response is required.

Implements `activemq::commands::Command` (p. 882).

Referenced by `copyDataStructure()`.

6.83.2.18 `virtual bool activemq::commands::BaseCommand::isShutdownInfo () const [inline, virtual]`

Implements `activemq::commands::Command` (p. 882).

Reimplemented in `activemq::commands::ShutdownInfo` (p. 2351).

6.83.2.19 `virtual bool activemq::commands::BaseCommand::isTransactionInfo ()`
`const [inline, virtual]`

Implements `activemq::commands::Command` (p. 882).

Reimplemented in `activemq::commands::TransactionInfo` (p. 2591).

6.83.2.20 `virtual bool activemq::commands::BaseCommand::isWireFormatInfo ()`
`const [inline, virtual]`

Implements `activemq::commands::Command` (p. 882).

Reimplemented in `activemq::commands::WireFormatInfo` (p. 2706).

6.83.2.21 `virtual void activemq::commands::BaseCommand::setCommandId (int`
`id) [inline, virtual]`

Sets the **Command** (p. 879) Id of this **Message** (p. 1737).

Parameters:

id **Command** (p. 879) Id

Implements `activemq::commands::Command` (p. 882).

6.83.2.22 `virtual void activemq::commands::BaseCommand::setResponseRequired`
`(const bool required) [inline, virtual]`

Set if this **Message** (p. 1737) requires a **Response** (p. 2231).

Parameters:

required true if response is required

Implements `activemq::commands::Command` (p. 882).

6.83.2.23 `virtual std::string activemq::commands::BaseCommand::toString () const`
`[inline, virtual]`

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Implements `activemq::commands::Command` (p. 883).

Reimplemented in `activemq::commands::ActiveMQBlobMessage` (p. 150), `activemq::commands::ActiveMQBytesMessage` (p. 173), `activemq::commands::ActiveMQMapMessage` (p. 266), `activemq::commands::ActiveMQMessage` (p. 281), `activemq::commands::ActiveMQObjectMessage` (p. 312), `activemq::commands::ActiveMQStreamMessage` (p. 382), `activemq::commands::ActiveMQTextMessage` (p. 452), `activemq::commands::BrokerInfo`

- 6.84.2.2** `virtual activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller::~~BaseCommandMarshaller()` [inline, virtual]

6.84.3 Member Function Documentation

- 6.84.3.1** `virtual void activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryWriter that provides that data sink

Exceptions:

- IOException* if an error occurs during the **marshal** (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 152), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 179), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 268), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 283), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 314), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 388), `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 454), `activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller` (p. 616), `activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller` (p. 951), `activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller` (p. 967), `activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller` (p. 1004), `activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller` (p. 1034), `activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller` (p. 1071), `activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller` (p. 1092), `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1105), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1136), `activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller` (p. 1200), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1280), `activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller` (p. 1365), `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1454), `activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller` (p. 1559), `activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller` (p. 1788), `activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller` (p. 1816), `activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller`

(p. 1838), `activemq::wireformat::openwire::marshal::v3::MessageMarshaller` (p. 1867), `activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller` (p. 1903), `activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller` (p. 2091), `activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller` (p. 2132), `activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller` (p. 2190), `activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller` (p. 2203), `activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller` (p. 2219), `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2247), `activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller` (p. 2313), `activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller` (p. 2361), and `activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller` (p. 2599).

6.84.3.2 virtual void ac-

`activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller::looseUnmarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 153), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 180), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 269), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 284), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 315), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 389), `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 455), `activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller` (p. 617), `activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller` (p. 952), `activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller` (p. 968), `activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller` (p. 1005), `activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller` (p. 1035), `activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller` (p. 1072), `activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller` (p. 1093), `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1106), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1137), `activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller` (p. 1201), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1281), `activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller` (p. 1366), `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1455), `activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller` (p. 1560),

6.84.3.3 virtual int activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)
[virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- bs* - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller** (p. 153), **activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller** (p. 180), **activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller** (p. 269), **activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller** (p. 284), **activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller** (p. 315), **activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller** (p. 389), **activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller** (p. 455), **activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller** (p. 617), **activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller** (p. 952), **activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller** (p. 968), **activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller** (p. 1005), **activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller** (p. 1035), **activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller** (p. 1072), **activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller** (p. 1093), **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1106),

- 6.85.3.1 `virtual void` `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 156), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 183), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 272), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 287), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 318), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 392), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 458), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 620), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 955), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 971), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1008), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1038), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1075), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1088), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1109), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1140), `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1204), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1284), `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 1361), `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1450), `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller` (p. 1567), `activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller` (p. 1792), `activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller` (p. 1820), `activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller`

(p. 1834), [activemq::wireformat::openwire::marshal::v1::MessageMarshaller](#) (p. 1872), [activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller](#) (p. 1907), [activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller](#) (p. 2095), [activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller](#) (p. 2136), [activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller](#) (p. 2186), [activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller](#) (p. 2207), [activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller](#) (p. 2223), [activemq::wireformat::openwire::marshal::v1::ResponseMarshaller](#) (p. 2252), [activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller](#) (p. 2305), [activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller](#) (p. 2357), and [activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller](#) (p. 2603).

6.85.3.2 virtual void activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataIn* - BinaryReader that provides that data source

Exceptions:

- IOException* if an error occurs during the unmarshal.

Implements [activemq::wireformat::openwire::marshal::DataStreamMarshaller](#) (p. 1158).

Reimplemented in [activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller](#) (p. 157), [activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller](#) (p. 184), [activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller](#) (p. 273), [activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller](#) (p. 288), [activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller](#) (p. 319), [activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller](#) (p. 393), [activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller](#) (p. 459), [activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller](#) (p. 621), [activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller](#) (p. 956), [activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller](#) (p. 972), [activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller](#) (p. 1009), [activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller](#) (p. 1039), [activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller](#) (p. 1076), [activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller](#) (p. 1089), [activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller](#) (p. 1110), [activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller](#) (p. 1141), [activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller](#) (p. 1205), [activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller](#) (p. 1285), [activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller](#) (p. 1362), [activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller](#) (p. 1451), [activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller](#) (p. 1568),

`activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller` (p. 1793), `activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller` (p. 1821), `activemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller` (p. 1835), `activemq::wireformat::openwire::marshal::v1::MessageMarshaller` (p. 1872), `activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller` (p. 1908), `activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller` (p. 2096), `activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller` (p. 2137), `activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller` (p. 2187), `activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller` (p. 2208), `activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller` (p. 2224), `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2253), `activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller` (p. 2306), `activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller` (p. 2358), and `activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller` (p. 2604).

6.85.3.3 `virtual int activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller::tightMarshal1(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 157), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 273), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 288), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 319), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 393), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 459), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 621), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 956), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 972), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1009), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1039), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1076), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1089), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1110),

tivemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller::tightMarshal2
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

 tivemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream
 * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1169).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller`
 (p. 158), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller`

6.86.1 Detailed Description

Marshaling code for Open Wire Format for **BaseCommandMarshaller** (p. 528). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.86.2 Constructor & Destructor Documentation

- 6.86.2.1 `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::BaseCommandMarshaller()` [inline]
- 6.86.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::~~BaseCommandMarshaller()` [inline, virtual]

6.86.3 Member Function Documentation

- 6.86.3.1 `virtual void` `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryWriter that provides that data sink

Exceptions:

- IOException* if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 160), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 187), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 276), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 291), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 322), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 396), `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 462), `activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller` (p. 624), `activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller` (p. 959), `activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller` (p. 975), `activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller` (p. 1012), `activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller` (p. 1042), `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller` (p. 1079), `activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller` (p. 1096), `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1113), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1144), `activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller` (p. 1208), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1288), `activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller` (p. 1369), `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1446), `activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller` (p. 1563), `activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller` (p. 1784), `activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller` (p. 1812), `activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller`

(p. 1830), `activemq::wireformat::openwire::marshal::v2::MessageMarshaller` (p. 1862), `activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller` (p. 1899), `activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller` (p. 2099), `activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller` (p. 2128), `activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller` (p. 2182), `activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller` (p. 2199), `activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller` (p. 2215), `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2242), `activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller` (p. 2309), `activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller` (p. 2353), and `activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller` (p. 2595).

6.86.3.2 virtual void ac-

`activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::looseUnmarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 161), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 277), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 292), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 323), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 397), `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 463), `activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller` (p. 625), `activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller` (p. 960), `activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller` (p. 976), `activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller` (p. 1013), `activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller` (p. 1043), `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller` (p. 1080), `activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller` (p. 1097), `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1114), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1145), `activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller` (p. 1209), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1289), `activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller` (p. 1370), `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1447), `activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller` (p. 1564),

activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller (p. 1785), activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller (p. 1813), activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller (p. 1831), activemq::wireformat::openwire::marshal::v2::MessageMarshaller (p. 1862), activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller (p. 1900), activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller (p. 2100), activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller (p. 2129), activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller (p. 2183), activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller (p. 2200), activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller (p. 2216), activemq::wireformat::openwire::marshal::v2::ResponseMarshaller (p. 2243), activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller (p. 2310), activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller (p. 2354), and activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller (p. 2596).

6.86.3.3 virtual int activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- bs* - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 161), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 188), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 277), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 292), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 323), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 397), **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 463), **activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller** (p. 625), **activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller** (p. 960), **activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller** (p. 976), **activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller** (p. 1013), **activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller** (p. 1043), **activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller** (p. 1080), **activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller** (p. 1097), **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1114),

6.86.3.4 virtual void ac-

activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::tightMarshal2
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataOutputStream * *dataOut*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 162), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 189), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 278), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 293), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 324), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 398), **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 464), **activemq::wireformat::openwire::marshal::v2::BrokerInfoMarshaller** (p. 626), **activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller** (p. 961), **activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller** (p. 977), **activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller** (p. 1014),

6.86.3.5 virtual void activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream
 * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions:

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1169).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller`
 (p. 162), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller`
 (p. 189), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller`

Public Member Functions

- virtual `~BaseDataStreamMarshaller` ()
- virtual `int tightMarshal1 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual `void tightMarshal2 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual `void tightUnmarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataInputStream *dis AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException)`
Tight Un-Marshal to the given stream.
- virtual `void looseMarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED) throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual `void looseUnmarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataInputStream *dis AMQCPP_UNUSED) throw (decaf::io::IOException)`
Loose Un-Marshal to the given stream.

Static Public Member Functions

- static `std::string toString (const commands::MessageId *id)`
Converts the object to a String.
- static `std::string toString (const commands::ProducerId *id)`
Converts the object to a String.

- static std::string **toString** (const **commands::TransactionId** *txnId)
Converts the given transaction ID into a String.
- static std::string **toHexFromBytes** (const std::vector< unsigned char > &data)
given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Protected Member Functions

- virtual **commands::DataStructure** * **tightUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tight Unmarshal the cached object.
- virtual int **tightMarshalCachedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.
- virtual void **tightMarshalCachedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tightly marshals the passed DataStructure based object to the passed streams returning nothing.
- virtual void **looseMarshalCachedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Loosely marshals the passed DataStructure based object to the passed stream returning nothing.
- virtual **commands::DataStructure** * **looseUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Loose Unmarshal the cached object.
- virtual int **tightMarshalNestedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.
- virtual void **tightMarshalNestedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tightly marshals the passed DataStructure based object to the passed streams returning nothing.
- virtual **commands::DataStructure** * **tightUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tight Unmarshal the nested object.

- virtual **commands::DataStructure * looseUnmarshalNestedObject** (**OpenWireFormat *wireFormat**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)

Loose Unmarshal the nested object.

- virtual void **looseMarshalNestedObject** (**OpenWireFormat *wireFormat**, **commands::DataStructure *object**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)

Loose marshal the nested object.

- virtual std::string **tightUnmarshalString** (**decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)

Performs Tight Unmarshaling of String Objects.

- virtual int **tightMarshalString1** (const std::string &value, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

- virtual void **tightMarshalString2** (const std::string &value, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)

Tight Marshals the passed string to the streams passed.

- virtual void **looseMarshalString** (const std::string value, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)

Loose Marshal the String to the DataOuputStream passed.

- virtual std::string **looseUnmarshalString** (**decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)

Loose Un-Marshal the String to the DataOuputStream passed.

- virtual int **tightMarshalLong1** (**OpenWireFormat *wireFormat**, long long value, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)

Tightly marshal (p. 76) the long long to the BooleanStream passed.

- virtual void **tightMarshalLong2** (**OpenWireFormat *wireFormat**, long long value, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)

Tightly marshal (p. 76) the long long to the Streams passed.

- virtual long long **tightUnmarshalLong** (**OpenWireFormat *wireFormat**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)

Tight marshal (p. 76) the long long type.

- virtual void **looseMarshalLong** (**OpenWireFormat *wireFormat**, long long value, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)

Tightly marshal (p. 76) the long long to the BooleanStream passed.

- virtual long long **looseUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Loose marshal (p. 76) the long long type.
- virtual std::vector< unsigned char > **tightUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tight Unmarshal an array of char.
- virtual std::vector< unsigned char > **looseUnmarshalByteArray** (**decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Loose Unmarshal an array of char.
- virtual std::vector< unsigned char > **tightUnmarshalConstByteArray** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs, int size) throw (**decaf::io::IOException**)
Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.
- virtual std::vector< unsigned char > **looseUnmarshalConstByteArray** (**decaf::io::DataInputStream** *dataIn, int size) throw (**decaf::io::IOException**)
Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.
- virtual **commands::DataStructure** * **tightUnmarshalBrokerError** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tight Unmarshal the Error object.
- virtual int **tightMarshalBrokerError1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tight Marshal the Error object.
- virtual void **tightMarshalBrokerError2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Tight Marshal the Error object.
- virtual **commands::DataStructure** * **looseUnmarshalBrokerError** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Loose Unmarshal the Error object.
- virtual void **looseMarshalBrokerError** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Tight Marshal the Error object.
- template<typename T >
int **tightMarshalObjectArray1** (**OpenWireFormat** *wireFormat, std::vector< T > objects, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

- `template<typename T >`
`void tightMarshalObjectArray2 (OpenWireFormat *wireFormat, std::vector< T > objects, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`

Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

- `template<typename T >`
`void looseMarshalObjectArray (OpenWireFormat *wireFormat, std::vector< T > objects, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`

Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

- `virtual std::string readAsciiString (decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)`

Given an DataInputStream read a know ASCII formatted string from the input and return that string.

6.87.1 Detailed Description

Base class for all Marshallers that **marshal** (p. 76) DataStructures to and from the wire using the OpenWire protocol.

Since:

2.0

6.87.2 Constructor & Destructor Documentation

- 6.87.2.1 `virtual`
`activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::~BaseDataStreamMarshaller() [inline, virtual]`

6.87.3 Member Function Documentation

- 6.87.3.1 `virtual void` `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshal`
`(OpenWireFormat *format AMQCPP_UNUSED,
commands::DataStructure *command AMQCPP_UNUSED,
decaf::io::DataOutputStream *ds AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

Tight Marshal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to **marshal** (p. 76) to

Exceptions:

IOException if an error occurs.

6.87.3.2 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalBrokerError
(OpenWireFormat * *wireFormat*, commands::DataStructure * *data*,
decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException)
[protected, virtual]

Tight Marshal the Error object.

Parameters:

wireFormat - The OpenwireFormat properties

data - Error to Marshal

dataOut - stream to write marshalled data to

Exceptions:

IOException if an error occurs.

6.87.3.3 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalCachedObject
(OpenWireFormat * *wireFormat*, commands::DataStructure * *data*,
decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException)
[protected, virtual]

Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

Parameters:

wireFormat - The OpenwireFormat properties

data - DataStructure Object Pointer to **marshal** (p. 76)

dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.87.3.4 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalLong
(OpenWireFormat * *wireFormat*, long long *value*,
decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException)
[protected, virtual]

Tightly **marshal** (p. 76) the long long to the BooleanStream passed.

Parameters:

wireFormat - The OpenwireFormat properties
value - long long to **marshal** (p. 76)
dataOut - DataOutputStream to **marshal** (p. 76) to.

Exceptions:

IOException if an error occurs.

6.87.3.5 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalNestedObject(OpenWireFormat * wireFormat, commands::DataStructure * object, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`
 [protected, virtual]

Loose marshal the nested object.

Parameters:

wireFormat - The OpenwireFormat properties
object - DataStructure Object Pointer to **marshal** (p. 76)
dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.87.3.6 `template<typename T > void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(OpenWireFormat * wireFormat, std::vector< T > objects, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`
 [inline, protected]

Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters:

wireFormat - The OpenwireFormat properties
objects - array of DataStructure object pointers.
dataOut - stream to write marshalled data to

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, and AMQ_CATCHALL_THROW.

6.87.3.7 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalString (const std::string *value*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [protected, virtual]

Loose Marshal the String to the DataOutputStream passed.

Parameters:

value - string to **marshal** (p. 76)
dataOut - stream to write marshaled form to

Exceptions:

IOException if an error occurs.

6.87.3.8 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshal (OpenWireFormat **format* *AMQCPP_UNUSED*, commands::DataStructure **command* *AMQCPP_UNUSED*, decaf::io::DataInputStream **dis* *AMQCPP_UNUSED*) throw (decaf::io::IOException) [inline, virtual]

Loose Un-Marshal to the given stream.

Parameters:

format - The OpenWireFormat properties
command - the object to Un-Marshal
dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

6.87.3.9 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalBroken (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [protected, virtual]

Loose Unarshal the Error object.

Parameters:

wireFormat - The OpenWireFormat properties
dataIn - stream to read marshalled form from

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.87.3.10 `virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalBytes(
(decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)
[protected, virtual]`

Loose Unmarshal an array of char.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

Returns:

the unmarshalled vector of chars.

Exceptions:

IOException if an error occurs.

6.87.3.11 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalCache(
(OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn)
throw (decaf::io::IOException) [protected, virtual]`

Loose Unmarshal the cached object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.87.3.12 `virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalConst(
(decaf::io::DataInputStream * dataIn, int size) throw (
decaf::io::IOException) [protected, virtual]`

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

size - size of the const array to unmarshal

Returns:

the unmarshaled vector of chars.

Exceptions:

IOException if an error occurs.

6.87.3.13 virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalLong (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [protected, virtual]

Loose marshal (p. 76) the long long type.

Parameters:

wireFormat - The OpenWireFormat properties

dataIn - stream to read marshaled form from

Returns:

the unmarshaled long long

Exceptions:

IOException if an error occurs.

6.87.3.14 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalNested (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [protected, virtual]

Loose Unmarshal the nested object.

Parameters:

wireFormat - The OpenWireFormat properties

dataIn - stream to read marshaled form from

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.87.3.15 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalString (decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [protected, virtual]

Loose Un-Marshal the String to the DataOutputStream passed.

Parameters:

dataIn - stream to read marshaled form from

Returns:

the unmarshaled string

Exceptions:

IOException if an error occurs.

6.87.3.16 `virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::readAsciiString (decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)`
[protected, virtual]

Given an DataInputStream read a know ASCII formatted string from the input and return that string.

Parameters:

dataIn - DataInputStream to read from

Returns:

string value read from stream

6.87.3.17 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal1 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException)` [inline, virtual]

Tight Marshal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

bs - boolean stream to **marshal** (p. 76) to.

Exceptions:

IOException if an error occurs.

6.87.3.18 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal2 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) throw (decaf::io::IOException)` [inline, virtual]

Tight Marshal to the given stream.

Parameters:

format - The OpenwireFormat properties
command - the object to Marshal
ds - the DataOutputStream to Marshal to
bs - boolean stream to **marshal** (p. 76) to.

Exceptions:

IOException if an error occurs.

6.87.3.19 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerE
(OpenWireFormat * *wireFormat*, commands::DataStructure * *data*,
utils::BooleanStream * *bs*) throw (decaf::io::IOException) [protected,
virtual]

Tight Marshal the Error object.

Parameters:

wireFormat - The OpenwireFormat properties
data - Error to Marshal
bs - boolean stream to **marshal** (p. 76) to.

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

6.87.3.20 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerE
(OpenWireFormat * *wireFormat*, commands::DataStructure * *data*,
decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*)
throw (decaf::io::IOException) [protected, virtual]

Tight Marshal the Error object.

Parameters:

wireFormat - The OpenwireFormat properties
data - Error to Marshal
dataOut - stream to write marshalled data to
bs - boolean stream to **marshal** (p. 76) to.

Exceptions:

IOException if an error occurs.

6.87.3.21 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedC(OpenWireFormat * wireFormat, commands::DataStructure * data, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters:

wireFormat - The OpenwireFormat properties
data - DataStructure Object Pointer to **marshal** (p. 76)
bs - boolean stream to **marshal** (p. 76) to.

Returns:

size of data written.

Exceptions:

IOException if an error occurs.

6.87.3.22 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedC(OpenWireFormat * wireFormat, commands::DataStructure * data, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters:

wireFormat - The OpenwireFormat properties
data - DataStructure Object Pointer to **marshal** (p. 76)
bs - boolean stream to **marshal** (p. 76) to.
dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.87.3.23 `virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong1(OpenWireFormat * wireFormat, long long value, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly **marshal** (p. 76) the long long to the BooleanStream passed.

Parameters:

wireFormat - The OpenwireFormat properties

value - long long to **marshal** (p. 76)
bs - boolean stream to **marshal** (p. 76) to.

Returns:

size of data written.

Exceptions:

IOException if an error occurs.

6.87.3.24 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong2 (OpenWireFormat * *wireFormat*, long long *value*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [protected, virtual]

Tightly **marshal** (p. 76) the long long to the Streams passed.

Parameters:

wireFormat - The OpenWireFormat properties
value - long long to **marshal** (p. 76)
dataOut - stream to write marshaled form to
bs - boolean stream to **marshal** (p. 76) to.

Exceptions:

IOException if an error occurs.

6.87.3.25 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters:

wireFormat - The OpenWireFormat properties
object - DataStructure Object Pointer to **marshal** (p. 76)
bs - boolean stream to **marshal** (p. 76) to.

Returns:

size of data written.

Exceptions:

IOException if an error occurs.

6.87.3.26 `virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject (OpenWireFormat * wireFormat, commands::DataStructure * object, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters:

wireFormat - The OpenwireFormat properties
object - DataStructure Object Pointer to **marshal** (p. 76)
bs - boolean stream to **marshal** (p. 76) to.
dataOut - stream to write marshaled data to

Exceptions:

IOException if an error occurs.

6.87.3.27 `template<typename T > int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray (OpenWireFormat * wireFormat, std::vector< T > objects, utils::BooleanStream * bs) throw (decaf::io::IOException)` [inline, protected]

Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

Parameters:

wireFormat - The OpenwireFormat properties
objects - array of DataStructure object pointers.
bs - boolean stream to **marshal** (p. 76) to.

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, and AMQ_CATCHALL_THROW.

6.87.3.28 `template<typename T > void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray (OpenWireFormat * wireFormat, std::vector< T > objects, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [inline, protected]

Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters:

wireFormat - The OpenwireFormat properties
objects - array of DataStructure object pointers.
dataOut - stream to write marshalled data to
bs - boolean stream to **marshal** (p. 76) to.

Returns:

size of the marshalled data

Exceptions:

IOException if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, and AMQ_CATCHALL_THROW.

6.87.3.29 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString1 (const std::string & *value*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [protected, virtual]

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

Parameters:

value - string to **marshal** (p. 76)
bs - BooleanStream to use.

Returns:

size of marshaled string.

Exceptions:

IOException if an error occurs.

6.87.3.30 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString2 (const std::string & *value*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [protected, virtual]

Tight Marshals the passed string to the streams passed.

Parameters:

value - string to **marshal** (p. 76)
dataOut - the DataOutputStream to Marshal to
bs - boolean stream to **marshal** (p. 76) to.

Exceptions:

IOException if an error occurs.

6.87.3.31 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshal (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, decaf::io::DataInputStream *dis *AMQCPP_UNUSED*, utils::BooleanStream *bs *AMQCPP_UNUSED*) throw (decaf::io::IOException) [inline, virtual]

Tight Un-Marshall to the given stream.

Parameters:

format - The OpenwireFormat properties
command - the object to Un-Marshall
dis - the DataInputStream to Un-Marshall from
bs - boolean stream to Un-Marshall from.

Exceptions:

IOException if an error occurs.

6.87.3.32 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalBroken (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [protected, virtual]

Tight Unmarshall the Error object.

Parameters:

wireFormat - The OpenwireFormat properties
dataIn - stream to read marshalled form from
bs - boolean stream to **marshal** (p. 76) to.

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.87.3.33 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalByteArray (decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [protected, virtual]

Tight Unmarshal an array of char.

Parameters:

dataIn - the DataInputStream to Un-Marshall from

bs - boolean stream to unmarshal from.

Returns:

the unmarshaled vector of chars.

Exceptions:

IOException if an error occurs.

6.87.3.34 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalCache (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tight Unmarshal the cached object.

Parameters:

wireFormat - The OpenWireFormat properties

dataIn - stream to read marshaled form from

bs - boolean stream to **marshal** (p. 76) to.

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.87.3.35 `virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalConst (decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs, int size) throw (decaf::io::IOException)` [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

size - size of the const array to unmarshal

Returns:

the unmarshaled vector of chars.

Exceptions:

IOException if an error occurs.

6.87.3.36 `virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalLong (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tight **marshal** (p. 76) the long long type.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

bs - boolean stream to **marshal** (p. 76) to.

Returns:

the unmarshaled long long

Exceptions:

IOException if an error occurs.

6.87.3.37 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalNested (OpenWireFormat * wireFormat, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Tight Unmarshal the nested object.

Parameters:

wireFormat - The OpenwireFormat properties

dataIn - stream to read marshaled form from

bs - boolean stream to **marshal** (p. 76) to.

Returns:

pointer to a new DataStructure Object

Exceptions:

IOException if an error occurs.

6.87.3.38 `virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalString (decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [protected, virtual]

Performs Tight Unmarshaling of String Objects.

Parameters:

dataIn - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Returns:

the unmarshaled string.

Exceptions:

IOException if an error occurs.

6.87.3.39 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toHexFromBytes (const std::vector< unsigned char > & *data*) [static]

given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Parameters:

data - unsigned char data array pointer

Returns:

a string coded in hex that represents the data

6.87.3.40 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::TransactionId * *txnId*) [static]

Converts the given transaction ID into a String.

Parameters:

txnId - TransactionId poitner

Returns:

string representation of the id

6.87.3.41 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::ProducerId * *id*) [static]

Converts the object to a String.

Parameters:

id - ProducerId pointer

Returns:

string representing the id

6.87.3.42 `static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString(const commands::MessageId * id) [static]`

Converts the object to a String.

Parameters:

id - MessageId pointer

Returns:

string representing the id

Referenced by `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getCMSMessageID()`.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/BaseDataStreamMarshaller.h`

6.88 activemq::commands::BaseDataStructure Class Reference

#include <src/main/activemq/commands/BaseDataStructure.h> Inheritance diagram for activemq::commands::BaseDataStructure:

Public Member Functions

- virtual `~BaseDataStructure ()`
- virtual bool `isMarshalAware ()` const
Determine if this object is aware of marshaling and should have its before and after marshaling methods called.
- virtual void `beforeMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)`
Perform any processing needed before an marshal.
- virtual void `afterMarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)`
Perform any processing needed after an unmarshal.
- virtual void `beforeUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)`
Perform any processing needed before an unmarshal.
- virtual void `afterUnmarshal (wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)`
Perform any processing needed after an unmarshal.
- virtual void `setMarshaledForm (wireformat::WireFormat *wireFormat AMQCPP_UNUSED, const std::vector< char > &data AMQCPP_UNUSED)`
Called to set the data to this object that will contain the objects marshaled form.
- virtual std::vector< unsigned char > `getMarshaledForm (wireformat::WireFormat *wireFormat AMQCPP_UNUSED)`
Called to get the data to this object that will contain the objects marshaled form.
- virtual void `copyDataStructure (const DataStructure *src AMQCPP_UNUSED)`
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string `toString ()` const
*Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.*
- virtual bool `equals (const DataStructure *value AMQCPP_UNUSED)` const
*Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent.*

6.88.1 Constructor & Destructor Documentation

6.88.1.1 `virtual activemq::commands::BaseDataStructure::~~BaseDataStructure ()`
`[inline, virtual]`

6.88.2 Member Function Documentation

6.88.2.1 `virtual void activemq::commands::BaseDataStructure::afterMarshal`
`(wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (`
`decaf::io::IOException) [inline, virtual]`

Perform any processing needed after an unmarshal.

Parameters:

wireformat (p. 74) - the OpenWireFormat object in use.

6.88.2.2 `virtual void activemq::commands::BaseDataStructure::afterUnmarshal`
`(wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (`
`decaf::io::IOException) [inline, virtual]`

Perform any processing needed after an unmarshal.

Parameters:

wireformat (p. 74) - the OpenWireFormat object in use.

Reimplemented in `activemq::commands::Message` (p. 1741), and `activemq::commands::WireFormatInfo` (p. 2701).

6.88.2.3 `virtual void activemq::commands::BaseDataStructure::beforeMarshal`
`(wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (`
`decaf::io::IOException) [inline, virtual]`

Perform any processing needed before an marshal.

Parameters:

wireformat (p. 74) - the OpenWireFormat object in use.

Reimplemented in `activemq::commands::Message` (p. 1741), and `activemq::commands::WireFormatInfo` (p. 2702).

6.88.2.4 `virtual void activemq::commands::BaseDataStructure::beforeUnmarshal`
`(wireformat::WireFormat *wireFormat AMQCPP_UNUSED) throw (`
`decaf::io::IOException) [inline, virtual]`

Perform any processing needed before an unmarshal.

Parameters:

wireformat (p. 74) - the OpenWireFormat object in use.

6.88.2.5 virtual void activemq::commands::BaseDataStructure::copyDataStructure (const DataStructure *src *AMQCPP_UNUSED*) [inline, virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented in **activemq::commands::BooleanExpression** (p. 579).

6.88.2.6 virtual bool activemq::commands::BaseDataStructure::equals (const DataStructure *value *AMQCPP_UNUSED*) const [inline, virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Referenced by **activemq::commands::BooleanExpression::equals()**, and **activemq::commands::BaseCommand::equals()**.

6.88.2.7 virtual std::vector<unsigned char> activemq::commands::BaseDataStructure::getMarshaledForm (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [inline, virtual]

Called to get the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control unmarshaling

Returns:

buffer that holds the objects data.

6.88.2.8 virtual bool activemq::commands::BaseDataStructure::isMarshalAware () const [inline, virtual]

Determine if this object is aware of marshaling and should have its before and after marshaling methods called. Defaults to false.

Returns:

true if aware of marshaling

Implements **activemq::wireformat::MarshalAware** (p. 1714).

Reimplemented in **activemq::commands::ActiveMQMapMessage** (p. 262), **activemq::commands::ActiveMQStreamMessage** (p. 378), **activemq::commands::Message** (p. 1746), and **activemq::commands::WireFormatInfo** (p. 2704).

6.88.2.9 `virtual void activemq::commands::BaseDataStructure::setMarshaledForm (wireformat::WireFormat *wireFormat AMQCPP_UNUSED, const std::vector< char > &data AMQCPP_UNUSED)` [inline, virtual]

Called to set the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat - the **wireformat** (p. 74) object to control unmarshaling

data - vector of object binary data

6.88.2.10 `virtual std::string activemq::commands::BaseDataStructure::toString () const` [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Implements **activemq::commands::DataStructure** (p. 1177).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 150), **activemq::commands::ActiveMQBytesMessage** (p. 173), **activemq::commands::ActiveMQDestination** (p. 237), **activemq::commands::ActiveMQMapMessage** (p. 266), **activemq::commands::ActiveMQMessage** (p. 281), **activemq::commands::ActiveMQObjectMessage** (p. 312), **activemq::commands::ActiveMQQueue** (p. 340), **activemq::commands::ActiveMQStreamMessage** (p. 382), **activemq::commands::ActiveMQTempDestination** (p. 401), **activemq::commands::ActiveMQTempQueue** (p. 418), **activemq::commands::ActiveMQTempTopic** (p. 435), **activemq::commands::ActiveMQTextMessage** (p. 452), **activemq::commands::ActiveMQTopic** (p. 468), **activemq::commands::BaseCommand** (p. 512), **activemq::commands::BooleanExpression** (p. 579), **activemq::commands::BrokerId** (p. 594), **activemq::commands::BrokerInfo** (p. 612), **activemq::commands::Command** (p. 883), **activemq::commands::ConnectionControl** (p. 948), **activemq::commands::ConnectionError** (p. 964), **activemq::commands::ConnectionId** (p. 983), **activemq::commands::ConnectionInfo** (p. 1001), **activemq::commands::ConsumerControl** (p. 1031), **activemq::commands::ConsumerId** (p. 1048), **activemq::commands::ConsumerInfo** (p. 1067), **activemq::commands::ControlCommand** (p. 1085), **activemq::commands::DataArrayResponse** (p. 1103), **activemq::commands::DataResponse** (p. 1134), **activemq::commands::DestinationInfo** (p. 1197), **activemq::commands::DiscoveryEvent** (p. 1215), **activemq::commands::ExceptionResponse** (p. 1278), **activemq::commands::FlushCommand** (p. 1359), **activemq::commands::IntegerResponse** (p. 1444), **activemq::commands::JournalQueueAck** (p. 1493), **activemq::commands::JournalTopicAck** (p. 1510), **activemq::commands::JournalTrace** (p. 1526), **activemq::commands::JournalTransaction** (p. 1541), **activemq::commands::KeepAliveInfo** (p. 1557), **activemq::commands::LastPartialCommand** (p. 1577), **activemq::commands::LocalTransactionId** (p. 1603), **activemq::commands::Message** (p. 1749), **activemq::commands::MessageAck**

(p. 1781), [activemq::commands::MessageDispatch](#) (p. 1803), [activemq::commands::MessageDispatchNotification](#) (p. 1827), [activemq::commands::MessageId](#) (p. 1846), [activemq::commands::MessagePull](#) (p. 1896), [activemq::commands::NetworkBridgeFilter](#) (p. 1926), [activemq::commands::PartialCommand](#) (p. 1997), [activemq::commands::ProducerAck](#) (p. 2088), [activemq::commands::ProducerId](#) (p. 2108), [activemq::commands::ProducerInfo](#) (p. 2125), [activemq::commands::RemoveInfo](#) (p. 2179), [activemq::commands::RemoveSubscriptionInfo](#) (p. 2196), [activemq::commands::ReplayCommand](#) (p. 2212), [activemq::commands::Response](#) (p. 2233), [activemq::commands::SessionId](#) (p. 2287), [activemq::commands::SessionInfo](#) (p. 2302), [activemq::commands::ShutdownInfo](#) (p. 2351), [activemq::commands::SubscriptionInfo](#) (p. 2494), [activemq::commands::TransactionId](#) (p. 2575), [activemq::commands::TransactionInfo](#) (p. 2592), [activemq::commands::WireFormatInfo](#) (p. 2708), and [activemq::commands::XATransactionId](#) (p. 2734).

Referenced by [activemq::commands::BooleanExpression::toString\(\)](#), and [activemq::commands::BaseCommand::toString\(\)](#).

6.90 decaf::net::BindException Class Reference

#include <src/main/decaf/net/BindException.h> Inheritance diagram for decaf::net::BindException:

Public Member Functions

- **BindException** () throw ()
Default Constructor.
- **BindException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **BindException** (const **BindException** &ex) throw ()
Copy Constructor.
- **BindException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **BindException** (const std::exception ***cause**) throw ()
Constructor.
- **BindException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **BindException** * **clone** () const
Clones this exception.
- virtual ~**BindException** () throw ()

6.90.1 Constructor & Destructor Documentation

6.90.1.1 decaf::net::BindException::BindException () throw () [inline]

Default Constructor.

6.90.1.2 decaf::net::BindException::BindException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.90.1.3 `decaf::net::BindException::BindException (const BindException & ex)
throw () [inline]`

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.90.1.4 `decaf::net::BindException::BindException (const char * file, const int
lineNumber, const std::exception * cause, const char * msg, ...) throw ()
[inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.90.1.5 `decaf::net::BindException::BindException (const std::exception * cause)
throw () [inline]`

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.90.1.6 `decaf::net::BindException::BindException (const char * file, const int
lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.90.1.7 `virtual decaf::net::BindException::~~BindException () throw ()` [inline, virtual]

6.90.2 Member Function Documentation

6.90.2.1 `virtual BindException* decaf::net::BindException::clone () const` [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2380).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/BindException.h`

6.91 decaf::io::BlockingByteArrayInputStream Class Reference

This is a blocking version of a byte buffer stream.

#include <src/main/decaf/io/BlockingByteArrayInputStream.h> Inheritance diagram for decaf::io::BlockingByteArrayInputStream:

Public Member Functions

- **BlockingByteArrayInputStream** ()
*Default Constructor - uses a default **internal** (p. 95) buffer.*
- **BlockingByteArrayInputStream** (const unsigned char *buffer, std::size_t bufferSize)
*Constructor that initializes the **internal** (p. 95) buffer.*
- virtual ~**BlockingByteArrayInputStream** ()
Destructor.
- virtual void **setByteArray** (const unsigned char *buffer, std::size_t bufferSize)
Sets the data that this reader uses.
- virtual std::size_t **available** () const throw (IOException)
Indicates the number of bytes available to be read without blocking.
- virtual unsigned char **read** () throw (IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (IOException, lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual void **close** () throw (lang::Exception)
Closes the target input stream.
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual void **mark** (int readLimit DECAF_UNUSED)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (IOException)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.91.1 Detailed Description

This is a blocking version of a byte buffer stream. Read operations block until the requested data becomes available in the **internal** (p. 95) buffer via a call to setByteArray.

6.91.2 Constructor & Destructor Documentation

6.91.2.1 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream ()

Default Constructor - uses a default **internal** (p. 95) buffer.

6.91.2.2 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream (const unsigned char * *buffer*, std::size_t *bufferSize*)

Constructor that initializes the **internal** (p. 95) buffer.

See also:

setByteArray (p. 570).

6.91.2.3 virtual decaf::io::BlockingByteArrayInputStream::~~BlockingByteArrayInputStream () [virtual]

Destructor.

6.91.3 Member Function Documentation

6.91.3.1 `virtual std::size_t decaf::io::BlockingByteArrayInputStream::available () const throw (IOException) [inline, virtual]`

Indicates the number of bytes available to be read without blocking.

Returns:

the data available in the **internal** (p. 95) buffer.

Exceptions:

IOException (p. 1477) if an error occurs.

Implements **decaf::io::InputStream** (p. 1407).

6.91.3.2 `virtual void decaf::io::BlockingByteArrayInputStream::close () throw (lang::Exception) [virtual]`

Closes the target input stream.

Exceptions:

IOException (p. 1477) if an error occurs.

Implements **decaf::io::Closeable** (p. 840).

6.91.3.3 `virtual void decaf::io::BlockingByteArrayInputStream::lock () throw (lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.91.3.4 `virtual void decaf::io::BlockingByteArrayInputStream::mark (int readLimit DECAF_UNUSED) [inline, virtual]`

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1407).

6.91.3.5 virtual bool decaf::io::BlockingByteArrayInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1407).

6.91.3.6 virtual void decaf::io::BlockingByteArrayInputStream::notify () throw (lang::Exception) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.91.3.7 virtual void decaf::io::BlockingByteArrayInputStream::notifyAll () throw (lang::Exception) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.91.3.8 virtual int decaf::io::BlockingByteArrayInputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (IOException, lang::exceptions::NullPointerException) [virtual]

Reads an array of bytes from the buffer. If the desired amount of data is not currently available, this operation will block until the appropriate amount of data is available in the buffer via a call to `setByteArray`.

Parameters:

buffer (out) the target buffer

offset the position in the buffer to start from.

bufferSize the size of the output buffer.

Returns:

the number of bytes read. or -1 if EOF

Exceptions:

IOException (p. 1477) if an error occurs.

Implements **decaf::io::InputStream** (p. 1408).

6.91.3.9 virtual unsigned char decaf::io::BlockingByteArrayInputStream::read () throw (IOException) [virtual]

Reads a single byte from the buffer. This operation will block until data has been added to the buffer via a call to `setByteArray`.

Returns:

the next byte.

Exceptions:

IOException (p. 1477) if an error occurs.

Implements **decaf::io::InputStream** (p. 1408).

6.91.3.10 virtual void decaf::io::BlockingByteArrayInputStream::reset () throw (IOException) [inline, virtual]

Repositions this stream to the position at the time the `mark` method was last called on this input stream. If the method `markSupported` returns true, then: * If the method `mark` has not been called since the stream was created, or the number of bytes read from the stream since `mark` was last called is larger than the argument to `mark` at that last call, then an **IOException** (p. 1477) might be thrown. * If such an **IOException** (p. 1477) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to `mark` (or since the start of the file, if `mark` has not been called) will be resupplied to subsequent callers of the `read` method, followed by any bytes that otherwise would have been the next input data as of the time of the call to `reset`. If the method `markSupported` returns false, then: * The call to `reset` may throw an **IOException** (p. 1477). * If an **IOException** (p. 1477) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the `read` method depend on the particular type of the input stream.

Exceptions:

IOException (p. 1477)

Implements **decaf::io::InputStream** (p. 1408).

6.91.3.11 virtual void decaf::io::BlockingByteArrayInputStream::setByteArray (const unsigned char * buffer, std::size_t bufferSize) [virtual]

Sets the data that this reader uses. Replaces any existing data and resets the read index to the beginning of the buffer. When this method is called, it notifies any other threads that data is now available to be read.

Parameters:

buffer The new data to be copied to the **internal** (p. 95) buffer.

bufferSize The size of the new buffer.

6.91.3.12 `virtual std::size_t decaf::io::BlockingByteArrayInputStream::skip
(std::size_t num) throw (io::IOException,
lang::exceptions::UnsupportedOperationException)
[virtual]`

Skips over and discards *n* bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If *n* is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1406) creates a byte array and then repeatedly reads into it until *n* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num - the number of bytes to skip

Returns:

total bytes skipped

Exceptions:

IOException (p. 1477) if an error occurs

Implements **decaf::io::InputStream** (p. 1409).

6.91.3.13 `virtual void decaf::io::BlockingByteArrayInputStream::unlock () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

6.91.3.14 `virtual void decaf::io::BlockingByteArrayInputStream::wait (unsigned
long millisecs) throw (lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.91.3.15 `virtual void decaf::io::BlockingByteArrayInputStream::wait () throw (lang::Exception)` [inline, virtual]

Waits on a signal from this object, which is generated by a call to `Notify`. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2514).

The documentation for this class was generated from the following file:

Static Public Member Functions

- static **Boolean** **valueOf** (bool value)
- static **Boolean** **valueOf** (const std::string &value)
- static bool **parseBoolean** (const std::string &value)
Parses the String passed and extracts an bool.
- static std::string **toString** (bool value)
Converts the bool to a String representation.

Static Public Attributes

- static const **Boolean** `_FALSE`

The Class object representing the primitive false boolean.

- static const **Boolean** `_TRUE`

The Class object representing the primitive type boolean.

6.92.1 Constructor & Destructor Documentation

6.92.1.1 `decaf::lang::Boolean::Boolean (bool value)`

Parameters:

value - primitive boolean to wrap.

6.92.1.2 `decaf::lang::Boolean::Boolean (const std::string & value)`

Parameters:

value - String value to convert to a boolean.

6.92.1.3 `virtual decaf::lang::Boolean::~~Boolean ()` [inline, virtual]

6.92.2 Member Function Documentation

6.92.2.1 `bool decaf::lang::Boolean::booleanValue () const` [inline]

Returns:

the primitive boolean value of this object

6.92.2.2 `virtual int decaf::lang::Boolean::compareTo (const bool & b) const` [virtual]

Compares this **Boolean** (p. 573) instance with another.

Parameters:

b - the **Boolean** (p. 573) instance to be compared

Returns:

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements `decaf::lang::Comparable< bool >` (p. 899).

6.92.2.3 `virtual int decaf::lang::Boolean::compareTo (const Boolean & b) const`
[virtual]

Compares this **Boolean** (p. 573) instance with another.

Parameters:

b - the **Boolean** (p. 573) instance to be compared

Returns:

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

6.92.2.4 `bool decaf::lang::Boolean::equals (const bool & b) const` [inline, virtual]**Returns:**

true if the two **Boolean** (p. 573) Objects have the same value.

Implements `decaf::lang::Comparable< bool >` (p. 900).

6.92.2.5 `bool decaf::lang::Boolean::equals (const Boolean & b) const` [inline]**Returns:**

true if the two **Boolean** (p. 573) Objects have the same value.

6.92.2.6 `virtual bool decaf::lang::Boolean::operator< (const bool & value) const`
[virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< bool >` (p. 900).

6.92.2.7 `virtual bool decaf::lang::Boolean::operator< (const Boolean & value) const`
[virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.92.2.8 `virtual bool decaf::lang::Boolean::operator==(const bool & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< bool >` (p. 901).

6.92.2.9 `virtual bool decaf::lang::Boolean::operator==(const Boolean & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.92.2.10 `static bool decaf::lang::Boolean::parseBoolean(const std::string & value)`
[static]

Parses the String passed and extracts an bool.

Parameters:

value The std::string value to parse

Returns:

bool value

6.92.2.11 `static std::string decaf::lang::Boolean::toString(bool value)` [static]

Converts the bool to a String representation.

Parameters:

value The bool value to convert.

Returns:

std::string representation of the bool value passed.

6.92.2.12 `std::string decaf::lang::Boolean::toString () const`**Returns:**

the string representation of this Boolean's value.

6.92.2.13 `static Boolean decaf::lang::Boolean::valueOf (const std::string & value)`
[static]**Parameters:**

value The std::string value to convert to a Boolean (p. 573) instance.

Returns:

a Boolean (p. 573) instance of the string value

6.92.2.14 `static Boolean decaf::lang::Boolean::valueOf (bool value)` [static]**Parameters:**

value The bool value to convert to a Boolean (p. 573) instance.

Returns:

a Boolean (p. 573) instance of the primitive boolean value

6.92.3 Field Documentation**6.92.3.1** `const Boolean decaf::lang::Boolean::_FALSE` [static]

The Class object representing the primitive false boolean.

6.92.3.2 `const Boolean decaf::lang::Boolean::_TRUE` [static]

The Class object representing the primitive type boolean.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Boolean.h**

6.93 activemq::commands::BooleanExpression Class Reference

- 6.93.2.1** **virtual DataStructure* activemq::commands::BooleanExpression::cloneDataStructure** () const [inline, virtual]

Clone this obbect and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

6.93.2.2 virtual void activemq::commands::BooleanExpression::copyDataStructure (const DataStructure *src *AMQCPP_UNUSED*) [inline, virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::BaseDataStructure** (p. 559).

6.93.2.3 virtual bool activemq::commands::BooleanExpression::equals (const DataStructure * *value*) const [inline, virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

References **activemq::commands::BaseDataStructure::equals()**.

6.93.2.4 virtual std::string activemq::commands::BooleanExpression::toString () const [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 560).

References **activemq::commands::BaseDataStructure::toString()**.

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/BooleanExpression.h`

6.94 activemq::wireformat::openwire::utils::BooleanStream Class Reference

Manages the writing and reading of boolean data streams to and from a data source such as a `DataInputStream` or `DataOutputStream`.

```
#include <src/main/activemq/wireformat/openwire/utils/BooleanStream.h>
```

Public Member Functions

- **BooleanStream** ()
- virtual **~BooleanStream** ()
- bool **readBoolean** () throw (decaf::io::IOException)
Read a boolean data element from the internal data buffer.
- void **writeBoolean** (bool value) throw (decaf::io::IOException)
Writes a Boolean value to the internal data buffer.
- void **marshal** (decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)
Marshal the data to a DataOutputStream.
- void **marshal** (std::vector< unsigned char > &dataOut)
Marshal the data to a STL vector of unsigned chars.
- void **unmarshal** (decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Unmarshal a Boolean data stream from the Input Stream.
- void **clear** ()
Clears to old position markers, data starts at the beginning.
- int **marshalledSize** ()
Calc the size that data is marshalled to.

6.94.1 Detailed Description

Manages the writing and reading of boolean data streams to and from a data source such as a `DataInputStream` or `DataOutputStream`. The booleans are stored as single bits in the stream, with the stream size pre-pended to the stream when the data is marshalled.

The serialized form of the size field can be between 1 and 3 bytes. If the number of used bytes < 64, size=1 byte If the number of used bytes >=64 and < 256 (size of an unsigned byte), size=2 bytes If the number of used bytes >=256, size=3 bytes

The high-order 2 bits (128 and 64) of the first byte of the size field are used to encode the information about the number of bytes in the size field. The only time the first byte will contain a value >=64 is if there are more bytes in the size field. If the first byte < 64, the value of the byte is simply the size value. If the first byte = 0xC0, the following unsigned byte is the size field. If the first byte = 0x80, the following short (two bytes) are the size field.

6.94.2 Constructor & Destructor Documentation

6.94.2.1 `activemq::wireformat::openwire::utils::BooleanStream::BooleanStream ()`

6.94.2.2 `virtual
activemq::wireformat::openwire::utils::BooleanStream::~~BooleanStream ()
[inline, virtual]`

6.94.3 Member Function Documentation

6.94.3.1 `void activemq::wireformat::openwire::utils::BooleanStream::clear ()`

Clears to old position markers, data starts at the beginning.

6.94.3.2 `void activemq::wireformat::openwire::utils::BooleanStream::marshal
(std::vector< unsigned char > & dataOut)`

Marshal the data to a STL vector of unsigned chars.

Parameters:

dataOut - reference to a vector to write the data to.

6.94.3.3 `void activemq::wireformat::openwire::utils::BooleanStream::marshal
(decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`

Marshal the data to a DataOutputStream.

Parameters:

dataOut - Stream to write the data to.

6.94.3.4 `int activemq::wireformat::openwire::utils::BooleanStream::marshalledSize
()`

Calc the size that data is marshalled to.

Returns:

int size of marshalled data.

6.94.3.5 `bool activemq::wireformat::openwire::utils::BooleanStream::readBoolean
() throw (decaf::io::IOException)`

Read a boolean data element from the internal data buffer.

Returns:

boolean from the stream

6.94.3.6 `void activemq::wireformat::openwire::utils::BooleanStream::unmarshal
(decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)`

Unmarshal a Boolean data stream from the Input Stream.

Parameters:

dataIn - Input Stream to read data from.

6.94.3.7 `void activemq::wireformat::openwire::utils::BooleanStream::writeBoolean
(bool value) throw (decaf::io::IOException)`

Writes a Boolean value to the internal data buffer.

Parameters:

value - boolean data to write.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/utils/BooleanStream.h`

6.95 decaf::util::concurrent::BrokenBarrierException Class Reference

#include <src/main/decaf/util/concurrent/BrokenBarrierException.h> Inheritance diagram for decaf::util::concurrent::BrokenBarrierException:

Public Member Functions

- **BrokenBarrierException** () throw ()
Default Constructor.
- **BrokenBarrierException** (const decaf::lang::Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **BrokenBarrierException** (const BrokenBarrierException &ex) throw ()
Copy Constructor.
- **BrokenBarrierException** (const std::exception *cause) throw ()
Constructor.
- **BrokenBarrierException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **BrokenBarrierException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **BrokenBarrierException** * clone () const
Clones this exception.
- virtual ~**BrokenBarrierException** () throw ()

6.95.1 Constructor & Destructor Documentation

6.95.1.1 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException () throw () [inline]

Default Constructor.

6.95.1.2 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.95.1.3 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const BrokenBarrierException & ex) throw ()` [inline]

Copy Constructor.

Parameters:

ex The Exception to copy in this new instance.

References `decaf::lang::Exception::Exception()`.

6.95.1.4 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const std::exception * cause) throw ()` [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.95.1.5 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * file, const int lineNumber, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs
lineNumber - The line number where the exception occurred.
msg - The message to report
... - list of primitives that are formatted into the message

6.95.1.6 `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs
lineNumber - The line number where the exception occurred.
cause - The exception that was the cause for this one to be thrown.
msg - The message to report
... - list of primitives that are formatted into the message

6.95.1.7 **virtual**
 decaf::util::concurrent::BrokenBarrierException::~~BrokenBarrierException
 () throw () [inline, virtual]

6.95.2 Member Function Documentation

6.95.2.1 **virtual BrokenBarrierException* de-**
 caf::util::concurrent::BrokenBarrierException::clone ()
 const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**BrokenBarrierException.h**

6.96 activemq::commands::BrokerError Class Reference

This class represents an Exception sent from the Broker.

#include <src/main/activemq/commands/BrokerError.h> Inheritance diagram for activemq::commands::BrokerError:

Data Structures

- struct **StackTraceElement**

Public Member Functions

- **BrokerError** ()
- virtual **~BrokerError** ()
- virtual unsigned char **getDataStructureType** () const
*Get the **DataStructure** (p. 1174) Type as defined in **CommandTypes.h**.*
- virtual **BrokerError** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (**exceptions::ActiveMQException**)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- virtual const std::string & **getMessage** () const
Gets the string holding the error message.
- virtual void **setMessage** (const std::string &message)
*Sets the string that contains the error **Message** (p. 1737).*
- virtual const std::string & **getExceptionClass** () const
Gets the string holding the Exception Class name.
- virtual void **setExceptionClass** (const std::string &exceptionClass)
Sets the string that contains the Exception Class name.
- virtual const **decaf::lang::Pointer**< **BrokerError** > & **getCause** () const
Gets the Broker Error that caused this exception.
- virtual void **setCause** (const **decaf::lang::Pointer**< **BrokerError** > &cause)
Sets the Broker Error that caused this exception.

- virtual const std::vector< **decaf::lang::Pointer< StackTraceElement > >** & **getStackTraceElements** () const
Gets the Stack Trace Elements for the Exception.
- virtual void **setStackTraceElements** (const std::vector< **decaf::lang::Pointer< StackTraceElement > >** & stackTraceElements)
Sets the Stack Trace Elements for this Exception.

6.96.1 Detailed Description

This class represents an Exception sent from the Broker. The Broker sends java Throwables, so we must mimic its structure here.

6.96.2 Constructor & Destructor Documentation

6.96.2.1 **activemq::commands::BrokerError::BrokerError** () [inline]

6.96.2.2 **virtual activemq::commands::BrokerError::~~BrokerError** () [virtual]

6.96.3 Member Function Documentation

6.96.3.1 **virtual BrokerError* activemq::commands::BrokerError::cloneDataStructure** ()
const [inline, virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

References **copyDataStructure()**.

6.96.3.2 **virtual void activemq::commands::BrokerError::copyDataStructure** (const **DataStructure * src**) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

Referenced by **cloneDataStructure()**.

6.96.3.3 `virtual const decaf::lang::Pointer<BrokerError>&
activemq::commands::BrokerError::getCause () const [inline, virtual]`

Gets the Broker Error that caused this exception.

Returns:

Broker Error Pointer

6.96.3.4 `virtual unsigned char ac-
tivemq::commands::BrokerError::getDataStructureType ()
const [inline, virtual]`

Get the **DataStructure** (p. 1174) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 1176).

6.96.3.5 `virtual const std::string& ac-
tivemq::commands::BrokerError::getExceptionClass ()
const [inline, virtual]`

Gets the string holding the Exception Class name.

Returns:

Exception Class name

6.96.3.6 `virtual const std::string& activemq::commands::BrokerError::getMessage
() const [inline, virtual]`

Gets the string holding the error message.

Returns:

String Message (p. 1737)

6.96.3.7 `virtual const std::vector< decaf::lang::Pointer<StackTraceElement> >&
activemq::commands::BrokerError::getStackTraceElements () const
[inline, virtual]`

Gets the Stack Trace Elements for the Exception.

Returns:

Stack Trace Elements

6.96.3.8 virtual void activemq::commands::BrokerError::setCause (const decaf::lang::Pointer< BrokerError > & *cause*) [inline, virtual]

Sets the Broker Error that caused this exception.

Parameters:

cause - Broker Error

6.96.3.9 virtual void activemq::commands::BrokerError::setExceptionClass (const std::string & *exceptionClass*) [inline, virtual]

Sets the string that contains the Exception Class name.

Parameters:

exceptionClass - String Exception Class name

6.96.3.10 virtual void activemq::commands::BrokerError::setMessage (const std::string & *message*) [inline, virtual]

Sets the string that contains the error **Message** (p.1737).

Parameters:

message - String Error Message (p.1737)

6.96.3.11 virtual void activemq::commands::BrokerError::setStackTraceElements (const std::vector< decaf::lang::Pointer< StackTraceElement > > & *stackTraceElements*) [inline, virtual]

Sets the Stack Trace Elements for this Exception.

Parameters:

stackTraceElements - Stack Trace Elements

6.96.3.12 virtual decaf::lang::Pointer<commands::Command> activemq::commands::BrokerError::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p.2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.883).

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**BrokerError.h**

6.98.2.3 `virtual activemq::commands::BrokerId::~~BrokerId () [virtual]`

6.98.3 Member Function Documentation

6.98.3.1 `virtual BrokerId* activemq::commands::BrokerId::cloneDataStructure ()
const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.98.3.2 `virtual int activemq::commands::BrokerId::compareTo (const BrokerId &
value) const [virtual]`

6.98.3.3 `virtual void activemq::commands::BrokerId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.98.3.4 `virtual bool activemq::commands::BrokerId::equals (const BrokerId &
value) const [virtual]`

6.98.3.5 `virtual bool activemq::commands::BrokerId::equals (const DataStructure
* value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.98.3.6 `virtual unsigned char activemq::commands::BrokerId::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

6.98.3.7 `virtual std::string& activemq::commands::BrokerId::getValue () [virtual]`

6.98.3.8 `virtual const std::string& activemq::commands::BrokerId::getValue () const [virtual]`

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.99.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 595). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.99.2 Constructor & Destructor Documentation

6.99.2.1 `activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::BrokerIdMarshaller()` [inline]

6.99.2.2 `virtual activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::~~BrokerIdMarshaller()` [inline, virtual]

6.99.3 Member Function Documentation

6.99.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.99.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.99.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.99.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.99.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.99.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.99.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.100 activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller Class Reference

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 599).

#include <src/main/activemq/wireformat/openwire/marshal/v1/BrokerIdMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller:

Public Member Functions

- **BrokerIdMarshaller** ()
- virtual **~BrokerIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.100.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 599). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.100.2 Constructor & Destructor Documentation

6.100.2.1 `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::BrokerIdMarshaller()` [inline]

6.100.2.2 `virtual activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::~~BrokerIdMarshaller()` [inline, virtual]

6.100.3 Member Function Documentation

6.100.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.100.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.100.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.100.3.4 virtual void **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.100.3.5 virtual int **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.100.3.6 virtual void activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.100.3.7 virtual void activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**BrokerIdMarshaller.h**

6.101 activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller Class Reference

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 603).

#include <src/main/activemq/wireformat/openwire/marshal/v2/BrokerIdMarshaller.h> Inheritance diagram for activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller:

Public Member Functions

- **BrokerIdMarshaller** ()

Write a object instance to data output stream.

6.101.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 603). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.101.2 Constructor & Destructor Documentation

6.101.2.1 `activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::BrokerIdMarshaller()` [inline]

6.101.2.2 `virtual activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::~~BrokerIdMarshaller()` [inline, virtual]

6.101.3 Member Function Documentation

6.101.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.101.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.101.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1154).

6.101.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1158).

6.101.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::tightMarshal1** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - **BooleanStream** stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1162).

6.101.3.6 virtual void activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.101.3.7 virtual void activemq::wireformat::openwire::marshal::v2::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

6.102.1 Constructor & Destructor Documentation

6.102.1.1 `activemq::commands::BrokerInfo::BrokerInfo (const BrokerInfo &)`
[inline, protected]

6.102.1.2 `activemq::commands::BrokerInfo::BrokerInfo ()`

6.102.1.3 `virtual activemq::commands::BrokerInfo::~~BrokerInfo ()` [virtual]

6.102.2 Member Function Documentation

6.102.2.1 `virtual BrokerInfo* activemq::commands::BrokerInfo::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.102.2.2 `virtual void activemq::commands::BrokerInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.102.2.3 `virtual bool activemq::commands::BrokerInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

- 6.102.2.4 `virtual Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId ()`
[virtual]
- 6.102.2.5 `virtual const Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId () const`
[virtual]
- 6.102.2.6 `virtual std::string& activemq::commands::BrokerInfo::getBrokerName ()`
[virtual]
- 6.102.2.7 `virtual const std::string& activemq::commands::BrokerInfo::getBrokerName () const`
[virtual]
- 6.102.2.8 `virtual std::string& activemq::commands::BrokerInfo::getBrokerUploadUrl ()`
[virtual]
- 6.102.2.9 `virtual const std::string& activemq::commands::BrokerInfo::getBrokerUploadUrl () const` [virtual]
- 6.102.2.10 `virtual std::string& activemq::commands::BrokerInfo::getBrokerURL ()`
[virtual]
- 6.102.2.11 `virtual const std::string& activemq::commands::BrokerInfo::getBrokerURL () const`
[virtual]
- 6.102.2.12 `virtual long long activemq::commands::BrokerInfo::getConnectionId () const` [virtual]
- 6.102.2.13 `virtual unsigned char activemq::commands::BrokerInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.102.2.14** `virtual std::string& activemq::commands::BrokerInfo::getNetworkProperties ()`
[virtual]
- 6.102.2.15** `virtual const std::string& activemq::commands::BrokerInfo::getNetworkProperties ()`
`const` [virtual]
- 6.102.2.16** `virtual std::vector< decaf::lang::Pointer<BrokerInfo> >& activemq::commands::BrokerInfo::getPeerBrokerInfos ()` [virtual]
- 6.102.2.17** `virtual const std::vector< decaf::lang::Pointer<BrokerInfo> >& activemq::commands::BrokerInfo::getPeerBrokerInfos ()` `const`
[virtual]
- 6.102.2.18** `virtual bool activemq::commands::BrokerInfo::isBrokerInfo ()` `const`
[inline, virtual]

Returns:

an answer of true to the `isBrokerInfo()` (p. 611) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 509).

- 6.102.2.19 virtual bool activemq::commands::BrokerInfo::isDuplexConnection () const [virtual]
- 6.102.2.20 virtual bool activemq::commands::BrokerInfo::isFaultTolerantConfiguration () const [virtual]
- 6.102.2.21 virtual bool activemq::commands::BrokerInfo::isMasterBroker () const [virtual]
- 6.102.2.22 virtual bool activemq::commands::BrokerInfo::isNetworkConnection () const [virtual]
- 6.102.2.23 virtual bool activemq::commands::BrokerInfo::isSlaveBroker () const [virtual]
- 6.102.2.24 BrokerInfo& activemq::commands::BrokerInfo::operator= (const BrokerInfo &) [inline, protected]
- 6.102.2.25 virtual void activemq::commands::BrokerInfo::setBrokerId (const Pointer< BrokerId > & *brokerId*) [virtual]
- 6.102.2.26 virtual void activemq::commands::BrokerInfo::setBrokerName (const std::string & *brokerName*) [virtual]
- 6.102.2.27 virtual void activemq::commands::BrokerInfo::setBrokerUploadUrl (const std::string & *brokerUploadUrl*) [virtual]
- 6.102.2.28 virtual void activemq::commands::BrokerInfo::setBrokerURL (const std::string & *brokerURL*) [virtual]
- 6.102.2.29 virtual void activemq::commands::BrokerInfo::setConnectionId (long long *connectionId*) [virtual]
- 6.102.2.30 virtual void activemq::commands::BrokerInfo::setDuplexConnection (bool *duplexConnection*) [virtual]
- 6.102.2.31 virtual void activemq::commands::BrokerInfo::setFaultTolerantConfiguration (bool *faultTolerantConfiguration*) [virtual]
- 6.102.2.32 virtual void activemq::commands::BrokerInfo::setMasterBroker (bool *masterBroker*) [virtual]
- 6.102.2.33 virtual void activemq::commands::BrokerInfo::setNetworkConnection (bool *networkConnection*) [virtual]
- 6.102.2.34 virtual void activemq::commands::BrokerInfo::setNetworkProperties (const std::string & *networkProperties*) [virtual]
- 6.102.2.35 virtual void activemq::commands::BrokerInfo::setPeerBrokerInfos (const std::vector< decaf::lang::Pointer< BrokerInfo > > & *peerBrokerInfos*) [virtual]
- 6.102.2.36 virtual void activemq::commands::BrokerInfo::setSlaveBroker (bool *slaveBroker*) [virtual]
- 6.102.2.37 virtual std::string activemq::commands::BrokerInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.102.2.38 `virtual Pointer<Command> activemq::commands::BrokerInfo::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

Write a object instance to data output stream.

6.103.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerInfoMarshaller** (p. 615). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.103.2 Constructor & Destructor Documentation

6.103.2.1 `activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::BrokerInfoMarshaller()` [inline]

6.103.2.2 `virtual activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::~~BrokerInfoMarshaller()` [inline, virtual]

6.103.3 Member Function Documentation

6.103.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.103.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.103.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.103.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.103.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.103.3.6 virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.103.3.7 virtual void activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

6.104.3 Member Function Documentation

6.104.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.104.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.104.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.104.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.104.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.104.3.6 virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.104.3.7 virtual void activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

6.106.1 Detailed Description

A container for data of a specific primitive type. A buffer is a linear, finite sequence of elements of a specific primitive type. Aside from its content, the essential properties of a buffer are its capacity, limit, and position:

A buffer's capacity is the number of elements it contains. The capacity of a buffer is never negative and never changes.

A buffer's limit is the index of the first element that should not be read or written. A buffer's limit is never negative and is never greater than its capacity.

A buffer's position is the index of the next element to be read or written. A buffer's position is never negative and is never greater than its limit.

There is one subclass of this class for each non-boolean primitive type.

Transferring data: Each subclass of this class defines two categories of get and put operations: * Relative operations read or write one or more elements starting at the current position and then increment the position by the number of elements transferred. If the requested transfer exceeds the limit then a relative get operation throws a **BufferUnderflowException** (p. 661) and a relative put operation throws a **BufferOverflowException** (p. 658); in either case, no data is transferred. * Absolute operations take an explicit element index and do not affect the position. Absolute get and put operations throw an **IndexOutOfBoundsException** if the index argument exceeds the limit.

Data may also, of course, be transferred in to or out of a buffer by the I/O operations of an appropriate channel, which are always relative to the current position.

Marking and resetting:

A buffer's mark is the index to which its position will be reset when the reset method is invoked. The mark is not always defined, but when it is defined it is never negative and is never greater than the position. If the mark is defined then it is discarded when the position or the limit is adjusted to a value smaller than the mark. If the mark is not defined then invoking the reset method causes an **InvalidMarkException** (p. 1470) to be thrown.

Invariants:

The following invariant holds for the mark, position, limit, and capacity values: $0 \leq \text{mark} \leq \text{position} \leq \text{limit} \leq \text{capacity}$

A newly-created buffer always has a position of zero and a mark that is undefined. The initial limit may be zero, or it may be some other value that depends upon the type of the buffer and the manner in which it is constructed. The initial content of a buffer is, in general, undefined.

Clearing, flipping, and rewinding:

In addition to methods for accessing the position, limit, and capacity values and for marking and resetting, this class also defines the following operations upon buffers:

clear() (p. 629) makes a buffer ready for a new sequence of channel-read or relative put operations: It sets the limit to the capacity and the position to zero.

flip() (p. 630) makes a buffer ready for a new sequence of channel-write or relative get operations: It sets the limit to the current position and then sets the position to zero.

rewind() (p. 632) makes a buffer ready for re-reading the data that it already contains: It leaves the limit unchanged and sets the position to zero.

Read-only buffers:

Every buffer is readable, but not every buffer is writable. The mutation methods of each buffer class are specified as optional operations that will throw a **ReadOnlyBufferException** (p. 2167) when invoked upon a read-only buffer. A read-only buffer does not allow its content to be changed, but its mark, position, and limit values are mutable. Whether or not a buffer is read-only may be determined by invoking its `isReadOnly` method.

Thread safety:

Buffers are not safe for use by multiple concurrent threads. If a buffer is to be used by more than one thread then access to the buffer should be controlled by appropriate synchronization.

Invocation chaining:

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained; for example, the sequence of statements

```
b.flip(); b.position(23); b.limit(42);
```

can be replaced by the single, more compact statement `b.flip().position(23).limit(42);`

6.106.2 Constructor & Destructor Documentation

6.106.2.1 `decaf::nio::Buffer::Buffer (std::size_t capacity)`

6.106.2.2 `decaf::nio::Buffer::Buffer (const Buffer & other)`

6.106.2.3 `virtual decaf::nio::Buffer::~~Buffer ()` [inline, virtual]

6.106.3 Member Function Documentation

6.106.3.1 `virtual std::size_t decaf::nio::Buffer::capacity () const` [inline, virtual]

Returns:

this buffer's capacity.

6.106.3.2 `virtual Buffer& decaf::nio::Buffer::clear ()` [virtual]

Clears this buffer. The position is set to zero, the limit is set to the capacity, and the mark is discarded.

Invoke this method before using a sequence of channel-read or put operations to fill this buffer. For example:

```
buf.clear(); // Prepare buffer for reading in.read(buf); // Read data
```

This method does not actually erase the data in the buffer, but it is named as if it did because it will most often be used in situations in which that might as well be the case.

Returns:

a reference to this buffer.

6.106.3.3 virtual Buffer& decaf::nio::Buffer::flip () [virtual]

Flips this buffer. The limit is set to the current position and then the position is set to zero. If the mark is defined then it is discarded.

After a sequence of channel-read or put operations, invoke this method to prepare for a sequence of channel-write or relative get operations. For example:

```
buf.put(magic); // Prepend header
in.read(buf); // Read data into rest of buffer
buf.flip(); // Flip buffer
out.write(buf); // Write header + data to channel
```

This method is often used in conjunction with the compact method when transferring data from one place to another.

Returns:

a reference to this buffer.

6.106.3.4 virtual bool decaf::nio::Buffer::hasRemaining () const [inline, virtual]

Tells whether there are any elements between the current position and the limit.

Returns:

true if, and only if, there is at least one element remaining in this buffer

6.106.3.5 virtual bool decaf::nio::Buffer::isReadOnly () const [pure virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implemented in `decaf::internal::nio::ByteArrayBuffer` (p. 708), `decaf::internal::nio::CharArrayBuffer` (p. 814), `decaf::internal::nio::DoubleArrayBuffer` (p. 1247), `decaf::internal::nio::FloatArrayBuffer` (p. 1344), `decaf::internal::nio::IntArrayBuffer` (p. 1415), `decaf::internal::nio::LongArrayBuffer` (p. 1671), `decaf::internal::nio::ShortArrayBuffer` (p. 2335), and `decaf::nio::ByteBuffer` (p. 749).

6.106.3.6 virtual Buffer& decaf::nio::Buffer::limit (std::size_t newLimit) throw (lang::exceptions::IllegalArgumentException) [virtual]

Sets this buffer's limit. If the position is larger than the new limit then it is set to the new limit. If the mark is defined and larger than the new limit then it is discarded.

Parameters:

newLimit - The new limit value; must be no larger than this buffer's capacity

Returns:

A reference to This buffer

Exceptions:

IllegalArgumentException if preconditions on the new pos don't hold.

6.106.3.7 `virtual std::size_t decaf::nio::Buffer::limit () const [inline, virtual]`

Returns:

this buffers Limit

6.106.3.8 `virtual Buffer& decaf::nio::Buffer::mark () [virtual]`

Sets this buffer's mark at its position.

Returns:

a reference to this buffer.

6.106.3.9 `virtual Buffer& decaf::nio::Buffer::position (std::size_t newPosition)
throw (lang::exceptions::IllegalArgumentException) [virtual]`

Sets this buffer's position. If the mark is defined and larger than the new position then it is discarded.

Parameters:

newPosition - the new postion in the buffer to set.

Returns:

A reference to This buffer

Exceptions:

IllegalArgumentException if preconditions on the new pos don't hold.

6.106.3.10 `virtual std::size_t decaf::nio::Buffer::position () const [inline,
virtual]`

Returns:

the current position in the buffer

6.106.3.11 `virtual std::size_t decaf::nio::Buffer::remaining () const [inline, virtual]`

Returns the number of elements between the current position and the limit.

Returns:

The number of elements remaining in this buffer

6.106.3.12 `virtual Buffer& decaf::nio::Buffer::reset () throw (InvalidMarkException) [virtual]`

Resets this buffer's position to the previously-marked position.

Returns:

a reference to this buffer.

Exceptions:

InvalidMarkException (p. 1470) - If the mark has not been set

6.106.3.13 `virtual Buffer& decaf::nio::Buffer::rewind () [virtual]`

Rewinds this buffer. The position is set to zero and the mark is discarded.

Invoke this method before a sequence of channel-write or get operations, assuming that the limit has already been set appropriately. For example:

```
out.write(buf); // Write remaining data buf.rewind(); // Rewind buffer buf.get(array); // Copy data into array
```

Returns:

a reference to this buffer.

6.106.4 Field Documentation

6.106.4.1 `std::size_t decaf::nio::Buffer::_capacity [protected]`

- virtual std::size_t **available** () const throw (IOException)
Indicates the number of bytes available.
- virtual void **close** () throw (IOException)
*Close this **BufferedInputStream** (p. 633).*
- virtual unsigned char **read** () throw (IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (IOException, lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual void **mark** (int readLimit)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (IOException)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const
Determines if this input stream supports the mark and reset methods.

6.107.1 Detailed Description

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of `io` (p.100) operations on the input stream.

6.107.2 Constructor & Destructor Documentation

6.107.2.1 `decaf::io::BufferedInputStream::BufferedInputStream (InputStream * stream, bool own = false)`

Constructor.

Parameters:

stream The target input stream.

own indicates if we own the stream object, defaults to false

6.107.2.2 `decaf::io::BufferedInputStream::BufferedInputStream (InputStream * stream, std::size_t bufferSize, bool own = false) throw (lang::exceptions::IllegalArgumentException)`

Constructor.

Parameters:

stream the target input stream

bufferSize the size for the **internal** (p.95) buffer.

own indicates if we own the stream object, defaults to false.

Exceptions:

IllegalArgumentException is the size is zero.

6.107.2.3 `virtual decaf::io::BufferedInputStream::~~BufferedInputStream ()` [virtual]

6.107.3 Member Function Documentation

6.107.3.1 `virtual std::size_t decaf::io::BufferedInputStream::available () const` `throw (IOException)` [inline, virtual]

Indicates the number of bytes available.

Returns:

the sum of the amount of data available in the buffer and the data available on the target input stream.

Reimplemented from `decaf::io::FilterInputStream` (p.1317).

6.107.3.2 virtual void decaf::io::BufferedInputStream::close () throw (IOException) [virtual]

Close this **BufferedInputStream** (p. 633). This implementation closes the target stream and releases any resources associated with it.

Exceptions:

IOException (p. 1477) If an error occurs attempting to close this stream.

Reimplemented from **decaf::io::FilterInputStream** (p. 1317).

6.107.3.3 virtual void decaf::io::BufferedInputStream::mark (int readLimit) [inline, virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit max bytes read before marked position is invalid.

Reimplemented from **decaf::io::FilterInputStream** (p. 1318).

6.107.3.4 virtual bool decaf::io::BufferedInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1318).

6.107.3.5 virtual int decaf::io::BufferedInputStream::read (unsigned char * buffer, std::size_t offset, std::size_t bufferSize) throw (IOException, lang::exceptions::NullPointerException) [virtual]

Reads an array of bytes from the buffer. Blocks until the requested number of bytes are available.

Parameters:

buffer (out) the target buffer.

offset the position in the buffer to start reading from.

bufferSize the size of the output buffer.

Returns:

The number of bytes read or -1 if EOF

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException if buffer is NULL

Reimplemented from **decaf::io::FilterInputStream** (p.1319).

6.107.3.6 virtual unsigned char decaf::io::BufferedInputStream::read () throw (IOException) [virtual]

Reads a single byte from the buffer. Blocks until the data is available.

Returns:

The next byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p.1319).

6.107.3.7 virtual void decaf::io::BufferedInputStream::reset () throw (IOException) [inline, virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p.1477) might be thrown. * If such an **IOException** (p.1477) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p.1477). * If an **IOException** (p.1477) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException (p. 1477)

Reimplemented from **decaf::io::FilterInputStream** (p.1320).

6.107.3.8 virtual std::size_t decaf::io::BufferedInputStream::skip (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException) [virtual]

Skips over and discards n bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from

any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If *n* is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1406) creates a byte array and then repeatedly reads into it until *n* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num - the number of bytes to skip

Returns:

total bytes skipped

Exceptions:

IOException (p. 1477) if an error occurs

Reimplemented from **decaf::io::FilterInputStream** (p. 1320).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**BufferedInputStream.h**

6.108 decaf::io::BufferedOutputStream Class Reference

Wrapper around another output stream that buffers output before writing to the target output stream.

#include <src/main/decaf/io/BufferedOutputStream.h> Inheritance diagram for decaf::io::BufferedOutputStream:

Public Member Functions

- **BufferedOutputStream** (**OutputStream** *stream, bool **own**=false)
Constructor.
- **BufferedOutputStream** (**OutputStream** *stream, std::size_t bufferSize, bool **own**=false) throw (lang::exceptions::IllegalArgumentException)
Constructor.
- virtual ~**BufferedOutputStream** ()
- virtual void **write** (unsigned char c) throw (IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (IOException, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** () throw (IOException)
Invokes flush on the target output stream.
- void **close** () throw (lang::Exception)
Invokes close on the target output stream.

6.108.1 Detailed Description

Wrapper around another output stream that buffers output before writing to the target output stream.

6.108.2 Constructor & Destructor Documentation

6.108.2.1 decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * stream, bool own = false)

Constructor.

Parameters:

- stream* The target output stream.
- own* Indicates if this class owns the stream pointer.

6.108.2.2 `decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * stream, std::size_t bufferSize, bool own = false) throw (lang::exceptions::IllegalArgumentException)`

Constructor.

Parameters:

- stream* The target output stream.
- bufferSize* The size for the **internal** (p. 95) buffer.
- own* Indicates if this class owns the stream pointer.

6.108.2.3 `virtual decaf::io::BufferedOutputStream::~~BufferedOutputStream ()`
[virtual]

6.108.3 Member Function Documentation

6.108.3.1 `void decaf::io::BufferedOutputStream::close () throw (lang::Exception)`
[virtual]

Invokes close on the target output stream.

Exceptions:

CMSEException thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1324).

6.108.3.2 `virtual void decaf::io::BufferedOutputStream::flush () throw (IOException)` [virtual]

Invokes flush on the target output stream.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1324).

6.108.3.3 `virtual void decaf::io::BufferedOutputStream::write (const unsigned char * buffer, std::size_t offset, std::size_t len) throw (IOException, lang::exceptions::NullPointerException)` [virtual]

Writes an array of bytes to the output stream.

Parameters:

- buffer* The array of bytes to write.

offset the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1326).

6.108.3.4 `virtual void decaf::io::BufferedOutputStream::write (const std::vector< unsigned char > & buffer) throw (IOException) [virtual]`

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1326).

6.108.3.5 `virtual void decaf::io::BufferedOutputStream::write (unsigned char c) throw (IOException) [virtual]`

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1327).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/BufferedOutputStream.h`

6.109 decaf::net::BufferedSocket Class Reference

Buffered **Socket** (p.2371) class that wraps a **Socket** (p.2371) derived object and provides Buffered input and Output Streams to improve the efficiency of the reads and writes.

#include <src/main/decaf/net/BufferedSocket.h> Inheritance diagram for decaf::net::BufferedSocket:

Public Member Functions

- **BufferedSocket** (**Socket** *socket, int inputBufferSize=1000, int outputBufferSize=1000, bool own=true)
Constructs a new Buffered socket object.
- virtual ~**BufferedSocket** ()
- virtual void **connect** (const char *host, int port) throw (**SocketException**)
Connects to the specified destination.
- virtual void **close** () throw (lang::Exception)
Closes this object and deallocates the appropriate resources.
- virtual bool **isConnected** () const
Indicates whether or not this socket is connected to a destination.
- virtual **io::InputStream** * **getInputStream** ()
Gets the InputStream for this socket.
- virtual **io::OutputStream** * **getOutputStream** ()
Gets the OutputStream for this socket.
- virtual int **getSoLinger** () const throw (**SocketException**)
Gets the linger time.
- virtual void **setSoLinger** (int linger) throw (**SocketException**)
Sets the linger time.
- virtual bool **getKeepAlive** () const throw (**SocketException**)
Gets the keep alive flag.
- virtual void **setKeepAlive** (bool keepAlive) throw (**SocketException**)
Enables/disables the keep alive flag.
- virtual int **getReceiveBufferSize** () const throw (**SocketException**)
Gets the receive buffer size.
- virtual void **setReceiveBufferSize** (int size) throw (**SocketException**)
Sets the receive buffer size.

- virtual bool **getReuseAddress** () const throw (SocketException)
Gets the reuse address flag.
- virtual void **setReuseAddress** (bool reuse) throw (SocketException)
Sets the reuse address flag.
- virtual int **getSendBufferSize** () const throw (SocketException)
Gets the send buffer size.
- virtual void **setSendBufferSize** (int size) throw (SocketException)
Sets the send buffer size.
- virtual int **getSoTimeout** () const throw (SocketException)
Gets the timeout for socket operations.
- virtual void **setSoTimeout** (int timeout) throw (SocketException)
Sets the timeout for socket operations.

6.109.1 Detailed Description

Buffered **Socket** (p.2371) class that wraps a **Socket** (p.2371) derived object and provides Buffered input and Output Streams to improve the efficiency of the reads and writes.

6.109.2 Constructor & Destructor Documentation

- 6.109.2.1** `decaf::net::BufferedSocket::BufferedSocket (Socket * socket, int inputBufferSize = 1000, int outputBufferSize = 1000, bool own = true)`

Constructs a new Buffered socket object.

Parameters:

socket the socket to buffer
inputBufferSize size of the input buffer
outputBufferSize size of the output buffer
own does this object own the passed socket

- 6.109.2.2** `virtual decaf::net::BufferedSocket::~~BufferedSocket ()` [virtual]

6.109.3 Member Function Documentation

- 6.109.3.1** `virtual void decaf::net::BufferedSocket::close () throw (lang::Exception)`
[virtual]

Closes this object and deallocates the appropriate resources.

Exceptions:

CMSEException

Implements `decaf::io::Closeable` (p. 840).

6.109.3.2 virtual void decaf::net::BufferedSocket::connect (const char * *host*, int *port*) throw (SocketException) [virtual]

Connects to the specified destination. Closes this socket if connected to another destination.

Parameters:

host The host of the server to connect to.

port The port of the server to connect to.

Exceptions:

IOException Thrown if a failure occurred in the connect.

Implements **decaf::net::Socket** (p. 2372).

6.109.3.3 virtual io::InputStream* decaf::net::BufferedSocket::getInputStream () [inline, virtual]

Gets the InputStream for this socket.

Returns:

The InputStream for this socket. NULL if not connected.

Implements **decaf::net::Socket** (p. 2373).

6.109.3.4 virtual bool decaf::net::BufferedSocket::getKeepAlive () const throw (SocketException) [inline, virtual]

Gets the keep alive flag.

Returns:

True if keep alive is enabled.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2373).

References **decaf::net::Socket::getKeepAlive()**.

6.109.3.5 virtual io::OutputStream* decaf::net::BufferedSocket::getOutputStream () [inline, virtual]

Gets the OutputStream for this socket.

Returns:

the OutputStream for this socket. NULL if not connected.

Implements **decaf::net::Socket** (p. 2373).

6.109.3.6 `virtual int decaf::net::BufferedSocket::getReceiveBufferSize () const
throw (SocketException) [inline, virtual]`

Gets the receive buffer size.

Returns:

the receive buffer size in bytes.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2373).

References `decaf::net::Socket::getReceiveBufferSize()`.

6.109.3.7 `virtual bool decaf::net::BufferedSocket::getReuseAddress () const throw (SocketException) [inline, virtual]`

Gets the reuse address flag.

Returns:

True if the address can be reused.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2374).

References `decaf::net::Socket::getReuseAddress()`.

6.109.3.8 `virtual int decaf::net::BufferedSocket::getSendBufferSize () const throw (SocketException) [inline, virtual]`

Gets the send buffer size.

Returns:

the size in bytes of the send buffer.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2374).

References `decaf::net::Socket::getSendBufferSize()`.

6.109.3.9 `virtual int decaf::net::BufferedSocket::getSoLinger () const throw (SocketException) [inline, virtual]`

Gets the linger time.

Returns:

The linger time in seconds.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2374).

References **decaf::net::Socket::getSoLinger()**.

6.109.3.10 virtual int decaf::net::BufferedSocket::getSoTimeout () const throw (SocketException) [inline, virtual]

Gets the timeout for socket operations.

Returns:

The timeout in milliseconds for socket operations.

Exceptions:

SocketException (p. 2379) Thrown if unable to retrieve the information.

Implements **decaf::net::Socket** (p. 2375).

References **decaf::net::Socket::getSoTimeout()**.

6.109.3.11 virtual bool decaf::net::BufferedSocket::isConnected () const [inline, virtual]

Indicates whether or not this socket is connected to a destination.

Returns:

true if connected

Implements **decaf::net::Socket** (p. 2375).

References **decaf::net::Socket::isConnected()**.

6.109.3.12 virtual void decaf::net::BufferedSocket::setKeepAlive (bool *keepAlive*) throw (SocketException) [inline, virtual]

Enables/disables the keep alive flag.

Parameters:

keepAlive If true, enables the flag.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2375).

References **decaf::net::Socket::setKeepAlive()**.

6.109.3.13 `virtual void decaf::net::BufferedSocket::setReceiveBufferSize (int size)
throw (SocketException)` [inline, virtual]

Sets the receive buffer size.

Parameters:

size Number of bytes to set the receive buffer to.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements `decaf::net::Socket` (p. 2375).

References `decaf::net::Socket::setReceiveBufferSize()`.

6.109.3.14 `virtual void decaf::net::BufferedSocket::setReuseAddress (bool reuse)
throw (SocketException)` [inline, virtual]

Sets the reuse address flag.

Parameters:

reuse If true, sets the flag.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements `decaf::net::Socket` (p. 2376).

References `decaf::net::Socket::setReuseAddress()`.

6.109.3.15 `virtual void decaf::net::BufferedSocket::setSendBufferSize (int size)
throw (SocketException)` [inline, virtual]

Sets the send buffer size.

Parameters:

size The number of bytes to set the send buffer to.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements `decaf::net::Socket` (p. 2376).

References `decaf::net::Socket::setSendBufferSize()`.

6.109.3.16 `virtual void decaf::net::BufferedSocket::setSoLinger (int linger) throw (SocketException)` [inline, virtual]

Sets the linger time.

Parameters:

linger The linger time in seconds. If 0, linger is off.

Exceptions:

SocketException (p. 2379) if the operation fails.

Implements **decaf::net::Socket** (p. 2376).

References **decaf::net::Socket::setSoLinger()**.

**6.109.3.17 virtual void decaf::net::BufferedSocket::setSoTimeout (int *timeout*)
throw (SocketException) [inline, virtual]**

Sets the timeout for socket operations.

Parameters:

timeout The timeout in milliseconds for socket operations.

Exceptions:

SocketException (p. 2379) Thrown if unable to set the information.

Implements **decaf::net::Socket** (p. 2377).

References **decaf::net::Socket::setSoTimeout()**.

6.110 decaf::internal::nio::BufferFactory Class Reference

Factory class used by static methods in the **decaf::nio** (p.106) package to create the various default version of the NIO interfaces.

```
#include <src/main/decaf/internal/nio/BufferFactory.h>
```

Public Member Functions

- virtual **~BufferFactory** ()

Static Public Member Functions

- static **decaf::nio::ByteBuffer * createByteBuffer** (std::size_t capacity)
Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **decaf::nio::ByteBuffer * createByteBuffer** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
Wraps the passed buffer with a new ByteBuffer.
- static **decaf::nio::ByteBuffer * createByteBuffer** (std::vector< unsigned char > &buffer)
Wraps the passed STL Byte Vector in a ByteBuffer.
- static **decaf::nio::CharBuffer * createCharBuffer** (std::size_t capacity)
Allocates a new char buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **decaf::nio::CharBuffer * createCharBuffer** (char *buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
Wraps the passed buffer with a new CharBuffer.
- static **decaf::nio::CharBuffer * createCharBuffer** (std::vector< char > &buffer)
Wraps the passed STL Byte Vector in a CharBuffer.
- static **decaf::nio::DoubleBuffer * createDoubleBuffer** (std::size_t capacity)
Allocates a new double buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **decaf::nio::DoubleBuffer * createDoubleBuffer** (double *buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
Wraps the passed buffer with a new DoubleBuffer.
- static **decaf::nio::DoubleBuffer * createDoubleBuffer** (std::vector< double > &buffer)
Wraps the passed STL Double Vector in a DoubleBuffer.
- static **decaf::nio::FloatBuffer * createFloatBuffer** (std::size_t capacity)
Allocates a new float buffer whose position will be zero its limit will be its capacity and its mark is not set.

- static **decaf::nio::FloatBuffer * createFloatBuffer** (float *buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
Wraps the passed buffer with a new FloatBuffer.
- static **decaf::nio::FloatBuffer * createFloatBuffer** (std::vector< float > &buffer)
Wraps the passed STL Float Vector in a FloatBuffer.
- static **decaf::nio::LongBuffer * createLongBuffer** (std::size_t capacity)
Allocates a new long long buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **decaf::nio::LongBuffer * createLongBuffer** (long long *buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
Wraps the passed buffer with a new LongBuffer.
- static **decaf::nio::LongBuffer * createLongBuffer** (std::vector< long long > &buffer)
Wraps the passed STL Long Vector in a LongBuffer.
- static **decaf::nio::IntBuffer * createIntBuffer** (std::size_t capacity)
Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **decaf::nio::IntBuffer * createIntBuffer** (int *buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
Wraps the passed buffer with a new IntBuffer.
- static **decaf::nio::IntBuffer * createIntBuffer** (std::vector< int > &buffer)
Wraps the passed STL int Vector in a IntBuffer.
- static **decaf::nio::ShortBuffer * createShortBuffer** (std::size_t capacity)
Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **decaf::nio::ShortBuffer * createShortBuffer** (short *buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
Wraps the passed buffer with a new ShortBuffer.
- static **decaf::nio::ShortBuffer * createShortBuffer** (std::vector< short > &buffer)
Wraps the passed STL Short Vector in a ShortBuffer.

6.110.1 Detailed Description

Factory class used by static methods in the **decaf::nio** (p.106) package to create the various default version of the NIO interfaces.

6.110.2 Constructor & Destructor Documentation

6.110.2.1 `virtual decaf::internal::nio::BufferFactory::~~BufferFactory () [inline, virtual]`

6.110.3 Member Function Documentation

6.110.3.1 `static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (std::vector< unsigned char > & buffer) [static]`

Wraps the passed STL Byte Vector in a ByteBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new ByteBuffer that is backed by *buffer*, caller owns.

6.110.3.2 `static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (unsigned char * buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new ByteBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new ByteBuffer that is backed by *buffer*, caller owns.

6.110.3.3 `static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (std::size_t capacity) [static]`

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated ByteBuffer which the caller owns.

6.110.3.4 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (std::vector< char > & buffer) [static]`

Wraps the passed STL Byte Vector in a CharBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new CharBuffer that is backed by *buffer*, caller owns.

6.110.3.5 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (char * buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new CharBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new CharBuffer that is backed by *buffer*, caller owns.

6.110.3.6 `static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (std::size_t capacity) [static]`

Allocates a new char buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated CharBuffer which the caller owns.

6.110.3.7 `static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (std::vector< double > & buffer) [static]`

Wraps the passed STL Double Vector in a DoubleBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.8 `static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (double * buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new DoubleBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.9 `static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (std::size_t capacity) [static]`

Allocates a new double buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated DoubleBuffer which the caller owns.

6.110.3.10 `static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (std::vector< float > & buffer) [static]`

Wraps the passed STL Float Vector in a FloatBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.11 `static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (float * buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new FloatBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.12 `static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (std::size_t capacity) [static]`

Allocates a new float buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated DoubleBuffer which the caller owns.

6.110.3.13 `static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (std::vector< int > & buffer) [static]`

Wraps the passed STL int Vector in a IntBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.14 `static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (int * buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new IntBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.15 `static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (std::size_t capacity) [static]`

Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated DoubleBuffer which the caller owns.

6.110.3.16 `static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (std::vector< long long > & buffer) [static]`

Wraps the passed STL Long Vector in a LongBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.17 `static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (long long * buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new LongBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.18 `static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (std::size_t capacity) [static]`

Allocates a new long long buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated DoubleBuffer which the caller owns.

6.110.3.19 `static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (std::vector< short > & buffer) [static]`

Wraps the passed STL Short Vector in a ShortBuffer. The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.20 `static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (short * buffer, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new ShortBuffer. The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new DoubleBuffer that is backed by *buffer*, caller owns.

6.110.3.21 `static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (std::size_t capacity) [static]`

Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated DoubleBuffer which the caller owns.

6.111.1 Constructor & Destructor Documentation

6.111.1.1 decaf::nio::BufferOverflowException::BufferOverflowException () throw () [inline]

Default Constructor.

6.111.1.2 decaf::nio::BufferOverflowException::BufferOverflowException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy

6.111.1.3 decaf::nio::BufferOverflowException::BufferOverflowException (const BufferOverflowException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.111.1.4 decaf::nio::BufferOverflowException::BufferOverflowException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.111.1.5 decaf::nio::BufferOverflowException::BufferOverflowException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.111.1.6 decaf::nio::BufferOverflowException::BufferOverflowException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.111.1.7 `virtual decaf::nio::BufferOverflowException::~~BufferOverflowException
() throw () [inline, virtual]`

6.111.2 Member Function Documentation

6.111.2.1 `virtual BufferOverflowException* de-
caf::nio::BufferOverflowException::clone () const [inline,
virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/BufferOverflowException.h`

Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (unsigned char value)
- static **Byte decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a String into a **Byte** (p. 664).*
- static unsigned char **parseByte** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed unsigned char in the radix specified by the second argument.
- static unsigned char **parseByte** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal unsigned char.
- static **Byte valueOf** (unsigned char value)
*Returns a **Character** (p. 801) instance representing the specified char value.*
- static **Byte valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Byte** (p. 664) object holding the value given by the specified std::string.*
- static **Byte valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Byte** (p. 664) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const unsigned char **MIN_VALUE** = 0x7F
The minimum value that a unsigned char can take on.
- static const unsigned char **MAX_VALUE** = 0x80
The maximum value that a unsigned char can take on.
- static const int **SIZE** = 8
The size of the primitive charactor in bits.

6.113.1 Constructor & Destructor Documentation

6.113.1.1 decaf::lang::Byte::Byte (unsigned char *value*)

Parameters:

value - the primitive value to wrap

6.113.1.2 `decaf::lang::Byte::Byte (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters:

value - the string to convert to an unsigned char

Exceptions:

NumberFormatException

6.113.1.3 `virtual decaf::lang::Byte::~~Byte () [inline, virtual]`

6.113.2 Member Function Documentation

6.113.2.1 `virtual unsigned char decaf::lang::Byte::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from `decaf::lang::Number` (p.1954).

6.113.2.2 `virtual int decaf::lang::Byte::compareTo (const unsigned char & c) const [inline, virtual]`

Compares this **Byte** (p.664) instance with a char type.

Parameters:

c - the char instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements `decaf::lang::Comparable< unsigned char >` (p.899).

6.113.2.3 `virtual int decaf::lang::Byte::compareTo (const Byte & c) const [inline, virtual]`

Compares this **Byte** (p.664) instance with another.

Parameters:

c - the **Byte** (p.664) instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.113.2.4 static Byte decaf::lang::Byte::decode (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Decodes a String into a **Byte** (p. 664). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Byte::parseByte** (p. 670) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Byte** (p. 664) object containing the decoded value

Exceptions:

NumberFormatException if the string is not formatted correctly.

6.113.2.5 virtual double decaf::lang::Byte::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.113.2.6 bool decaf::lang::Byte::equals (const unsigned char & *c*) const [inline, virtual]

Returns:

true if the two Bytes have the same value.

Implements **decaf::lang::Comparable< unsigned char >** (p. 900).

6.113.2.7 bool decaf::lang::Byte::equals (const Byte & *c*) const [inline]

Returns:

true if the two **Byte** (p. 664) Objects have the same value.

6.113.2.8 `virtual float decaf::lang::Byte::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.113.2.9 `virtual int decaf::lang::Byte::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.113.2.10 `virtual long long decaf::lang::Byte::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns:

long long the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.113.2.11 `virtual bool decaf::lang::Byte::operator< (const unsigned char & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< unsigned char >** (p.900).

6.113.2.12 `virtual bool decaf::lang::Byte::operator< (const Byte & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.113.2.13 `virtual bool decaf::lang::Byte::operator==(const unsigned char & c)
const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< unsigned char >` (p. 901).

6.113.2.14 `virtual bool decaf::lang::Byte::operator==(const Byte & c) const
[inline, virtual]`

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.113.2.15 `static unsigned char decaf::lang::Byte::parseByte(const std::string & s)
throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal unsigned char. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting unsigned char value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseByte(const std::string, int)` method.

Parameters:

s - String to convert to a unsigned char

Returns:

the converted unsigned char value

Exceptions:

NumberFormatException if the string is not a unsigned char.

6.113.2.16 `static unsigned char decaf::lang::Byte::parseByte (const std::string & s, int radix) throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed unsigned char in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 804) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type `NumberFormatException` is thrown if any of the following situations occurs:
 * The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 808) or larger than **Character::MAX_RADIX** (p. 807). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type unsigned char.

Parameters:

s - the String containing the unsigned char to be parsed

radix - the radix to be used while parsing s

Returns:

the unsigned char represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If String does not contain a parsable unsigned char.

6.113.2.17 `virtual short decaf::lang::Byte::shortValue () const [inline, virtual]`

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from `decaf::lang::Number` (p. 1956).

6.113.2.18 `static std::string decaf::lang::Byte::toString (unsigned char value) [static]`

Returns:

a string representing the primitive value as Base 10

6.113.2.19 `std::string decaf::lang::Byte::toString () const`

Returns:

this **Byte** (p. 664) Object as a String Representation

6.113.2.20 static Byte decaf::lang::Byte::valueOf (const std::string & *value*, int *radix*) throw (exceptions::NumberFormatException) [static]

Returns a **Byte** (p. 664) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed unsigned char in the radix specified by the second argument, exactly as if the argument were given to the parseByte(std::string, int) method. The result is a **Byte** (p. 664) object that represents the unsigned char value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Byte** (p. 664) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid unsigned char.

6.113.2.21 static Byte decaf::lang::Byte::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Byte** (p. 664) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal unsigned char, exactly as if the argument were given to the parseByte(std::string) method. The result is a **Byte** (p. 664) object that represents the unsigned char value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Byte** (p. 664) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal unsigned char.

6.113.2.22 static Byte decaf::lang::Byte::valueOf (unsigned char *value*) [inline, static]

Returns a **Character** (p. 801) instance representing the specified char value.

Parameters:

value - the primitive char to wrap.

Returns:

a new **Character** (p. 801) instance that wraps this value.

6.113.3 Field Documentation

6.113.3.1 `const unsigned char decaf::lang::Byte::MAX_VALUE = 0x80` [static]

The maximum value that a unsigned char can take on.

6.113.3.2 `const unsigned char decaf::lang::Byte::MIN_VALUE = 0x7F` [static]

The minimum value that a unsigned char can take on.

6.113.3.3 `const int decaf::lang::Byte::SIZE = 8` [static]

The size of the primitive charactor in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Byte.h`

6.114 decaf::internal::util::ByteArrayAdapter Class Reference

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

#include <src/main/decaf/internal/util/ByteArrayAdapter.h> Inheritance diagram for decaf::internal::util::ByteArrayAdapter:

Data Structures

- union **Array**

Public Member Functions

- **ByteArrayAdapter** (std::size_t capacity)
Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.
- **ByteArrayAdapter** (unsigned char *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (char *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (double *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (float *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (long long *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (int *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (short *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a byte array object that wraps the given array.
- virtual ~**ByteArrayAdapter** ()

- virtual std::size_t **getCapacity** () const
Gets the capacity of the underlying array.
- virtual std::size_t **getCharCapacity** () const
Gets the capacity of the underlying array as if it contains chars.
- virtual std::size_t **getDoubleCapacity** () const
Gets the capacity of the underlying array as if it contains doubles.
- virtual std::size_t **getFloatCapacity** () const
Gets the capacity of the underlying array as if it contains doubles.
- virtual std::size_t **getLongCapacity** () const
Gets the capacity of the underlying array as if it contains doubles.
- virtual std::size_t **getIntCapacity** () const
Gets the capacity of the underlying array as if it contains ints.
- virtual std::size_t **getShortCapacity** () const
Gets the capacity of the underlying array as if it contains shorts.
- virtual unsigned char * **getByteArray** ()
Gets the pointer to the array we are wrapping.
- virtual char * **getCharArray** ()
Gets the pointer to the array we are wrapping.
- virtual short * **getShortArray** ()
Gets the pointer to the array we are wrapping.
- virtual int * **getIntArray** ()
Gets the pointer to the array we are wrapping.
- virtual long long * **getLongArray** ()
Gets the pointer to the array we are wrapping.
- virtual double * **getDoubleArray** ()
Gets the pointer to the array we are wrapping.
- virtual float * **getFloatArray** ()
Gets the pointer to the array we are wrapping.
- virtual void **read** (unsigned char *buffer, std::size_t offset, std::size_t length) const throw (decaf::lang::exceptions::NullPointerException, decaf::nio::BufferUnderflowException)
Reads from the Byte array starting at the specified offset and reading the specified length.
- virtual void **write** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (decaf::lang::exceptions::NullPointerException, decaf::nio::BufferOverflowException)
*Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects **internal** (p. 95) array.*

- virtual void **resize** (std::size_t capacity) throw (lang::exceptions::InvalidStateException)
Resizes the underlying array to the new given capacity, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.
- virtual void **clear** ()
Clear all data from that Array, setting the underlying bytes to zero.
- unsigned char & **operator[]** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Allows the **ByteArrayAdapter** (p. 673) to be indexed as a standard array.*
- const unsigned char & **operator[]** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual unsigned char **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual char **getChar** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads one byte at the given index and returns it.
- virtual double **getDouble** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual double **getDoubleAt** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given byte index and returns it.
- virtual float **getFloat** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual float **getFloatAt** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given byte index and returns it.
- virtual long long **getLong** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual long long **getLongAt** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given byte index and returns it.
- virtual int **getInt** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.

- virtual int **getIntAt** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given byte index and returns it.
- virtual short **getShort** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads two bytes at the given index and returns it.
- virtual short **getShortAt** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads two bytes at the given byte index and returns it.
- virtual **ByteArrayAdapter** & **put** (std::size_t index, unsigned char value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes the given byte into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putChar** (std::size_t index, char value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes one byte containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putDouble** (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putDoubleAt** (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putFloat** (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putFloatAt** (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putLong** (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putLongAt** (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes eight bytes containing the given value, into this buffer at the given byte index.
- virtual **ByteArrayAdapter** & **putInt** (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteArrayAdapter** & **putIntAt** (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException)
Writes four bytes containing the given value, into this buffer at the given byte index.

- virtual **ByteArrayAdapter** & **putShort** (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException)

Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putShortAt** (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException)

Writes two bytes containing the given value, into this buffer at the given byte index.

6.114.1 Detailed Description

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data. All the array types are mapped down to a byte array and methods are supplied for accessing the data in any of the primitive type forms.

Methods in this class that do not return a specific value return a reference to this object so that calls can be chained.

6.114.2 Constructor & Destructor Documentation

6.114.2.1 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (std::size_t capacity)

Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

6.114.2.2 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (unsigned char * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.114.2.3 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (char * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)`

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.114.2.4 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (double * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)`

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.114.2.5 `decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (float * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)`

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.114.2.6 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (long long * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.114.2.7 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.114.2.8 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (short * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.114.2.9 `virtual decaf::internal::util::ByteArrayAdapter::~~ByteArrayAdapter ()`
[virtual]

6.114.3 Member Function Documentation

6.114.3.1 `virtual void decaf::internal::util::ByteArrayAdapter::clear ()` [virtual]

Clear all data from that Array, setting the underlying bytes to zero.

6.114.3.2 `virtual unsigned char decaf::internal::util::ByteArrayAdapter::get`
`(std::size_t index) const throw (`
`lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Absolute get method. Reads the byte at the given index.

Parameters:

index - the index in the Buffer where the byte is to be read

Returns:

the byte that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

6.114.3.3 `virtual unsigned char* de-`
`caf::internal::util::ByteArrayAdapter::getByteArray ()`
[inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p.673) objects that point to this array.

Returns:

an unsigned char* pointer to the array this object wraps.

6.114.3.4 `virtual std::size_t decaf::internal::util::ByteArrayAdapter::getCapacity ()`
`const` [inline, virtual]

Gets the capacity of the underlying array.

Returns:

the size the array.

6.114.3.5 `virtual char decaf::internal::util::ByteArrayAdapter::getChar (std::size_t`
`index) const throw (lang::exceptions::IndexOutOfBoundsException)`
[inline, virtual]

Reads one byte at the given index and returns it.

Parameters:

index - the index in the Buffer where the byte is to be read

Returns:

the char at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

6.114.3.6 virtual char* decaf::internal::util::ByteArrayAdapter::getCharArray ()
[inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p.673) objects that point to this array.

Returns:

an char* pointer to the array this object wraps.

6.114.3.7 virtual std::size_t decaf::internal::util::ByteArrayAdapter::getCharCapacity ()
const [inline, virtual]

Gets the capacity of the underlying array as if it contains chars.

Returns:

the size the array.

6.114.3.8 virtual double decaf::internal::util::ByteArrayAdapter::getDouble
(std::size_t *index*) const throw (
lang::exceptions::IndexOutOfBoundsException)
[virtual]

Reads eight bytes at the given index and returns it. The index is a relative to the size of the type to be read, in otherwords when accessing the element in the array index * sizeof(type) if the actual start index of the type to be read.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the double at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.9 `virtual double* decaf::internal::util::ByteArrayAdapter::getDoubleArray
() [inline, virtual]`

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p.673) objects that point to this array.

Returns:

an double* pointer to the array this object wraps.

6.114.3.10 `virtual double decaf::internal::util::ByteArrayAdapter::getDoubleAt
(std::size_t index) const throw (
lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Reads eight bytes at the given byte index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the double at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.11 `virtual std::size_t decaf::internal::util::ByteArrayAdapter::getDoubleCapacity
() const [inline, virtual]`

Gets the capacity of the underlying array as if it contains doubles.

Returns:

the size the array.

6.114.3.12 `virtual float decaf::internal::util::ByteArrayAdapter::getFloat
(std::size_t index) const throw (
lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Reads four bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the float at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.13 virtual float* decaf::internal::util::ByteArrayAdapter::getFloatArray ()
[inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p.673) objects that point to this array.

Returns:

an float* pointer to the array this object wraps.

6.114.3.14 virtual float decaf::internal::util::ByteArrayAdapter::getFloatAt
(std::size_t *index*) const throw (
lang::exceptions::IndexOutOfBoundsException)
[virtual]

Reads four bytes at the given byte index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the float at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.15 virtual std::size_t de-
caf::internal::util::ByteArrayAdapter::getFloatCapacity ()
const [inline, virtual]

Gets the capacity of the underlying array as if it contains doubles.

Returns:

the size the array.

6.114.3.16 `virtual int decaf::internal::util::ByteArrayAdapter::getInt (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Reads four bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the int at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.17 `virtual int* decaf::internal::util::ByteArrayAdapter::getIntArray ()`
[inline, virtual]

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p.673) objects that point to this array.

Returns:

an int* pointer to the array this object wraps.

6.114.3.18 `virtual int decaf::internal::util::ByteArrayAdapter::getIntAt (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Reads four bytes at the given byte index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the int at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.19 `virtual std::size_t decaf::internal::util::ByteArrayAdapter::getIntCapacity () const [inline, virtual]`

Gets the capacity of the underlying array as if it contains ints.

Returns:

the size the array.

6.114.3.20 `virtual long long decaf::internal::util::ByteArrayAdapter::getLong (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]`

Reads eight bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the long long at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.21 `virtual long long* decaf::internal::util::ByteArrayAdapter::getLongArray () [inline, virtual]`

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p.673) objects that point to this array.

Returns:

an long long* pointer to the array this object wraps.

6.114.3.22 `virtual long long decaf::internal::util::ByteArrayAdapter::getLongAt (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]`

Reads eight bytes at the given byte index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the long long at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.23 `virtual std::size_t decaf::internal::util::ByteArrayAdapter::getLongCapacity ()
 const [inline, virtual]`

Gets the capacity of the underlying array as if it contains doubles.

Returns:

the size the array.

6.114.3.24 `virtual short decaf::internal::util::ByteArrayAdapter::getShort
 (std::size_t index) const throw (
 lang::exceptions::IndexOutOfBoundsException)
 [virtual]`

Reads two bytes at the given index and returns it. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the short at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.25 `virtual short* decaf::internal::util::ByteArrayAdapter::getShortArray ()
 [inline, virtual]`

Gets the pointer to the array we are wrapping. Changes to the data in this array are reflected by all **ByteArrayAdapter** (p.673) objects that point to this array.

Returns:

an short* pointer to the array this object wraps.

6.114.3.26 virtual short decaf::internal::util::ByteArrayAdapter::getShortAt (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Reads two bytes at the given byte index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the short at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

6.114.3.27 virtual std::size_t decaf::internal::util::ByteArrayAdapter::getShortCapacity () const [inline, virtual]

Gets the capacity of the underlying array as if it contains shorts.

Returns:

the size the array.

6.114.3.28 const unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

6.114.3.29 unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (std::size_t *index*) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Allows the **ByteArrayAdapter** (p. 673) to be indexed as a standard array. calling the non const version allows the user to change the value at index

Parameters:

index - the position in the array to access

Exceptions:

IndexOutOfBoundsException

6.114.3.30 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::put (std::size_t index, unsigned char value) throw (lang::exceptions::IndexOutOfBoundsException)` [virtual]

Writes the given byte into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - position in the Buffer to write the data

value - the byte to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.31 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putChar (std::size_t index, char value) throw (lang::exceptions::IndexOutOfBoundsException)` [virtual]

Writes one byte containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.32 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDouble (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException)` [virtual]

Writes eight bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.33 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDoubleAt (std::size_t *index*, double *value*) throw (lang::exceptions::IndexOutOfBoundsException)
[virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.34 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloat (std::size_t *index*, float *value*) throw (lang::exceptions::IndexOutOfBoundsException)
[virtual]

Writes four bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.35 `virtual ByteArrayAdapter& de-
caf::internal::util::ByteArrayAdapter::putFloatAt (std::size_t index,
float value) throw (lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.36 `virtual ByteArrayAdapter& de-
caf::internal::util::ByteArrayAdapter::putInt (std::size_t
index, int value) throw (lang::exceptions::IndexOutOfBoundsException
) [virtual]`

Writes four bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.37 `virtual ByteArrayAdapter& de-
caf::internal::util::ByteArrayAdapter::putIntAt (std::size_t index,
int value) throw (lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.38 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLong (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Writes eight bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.39 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLongAt (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.40 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShort (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException)` [virtual]

Writes two bytes containing the given value, into this buffer at the given index. The index is a relative to the size of the type to be read, in other words when accessing the element in the array `index * sizeof(type)` if the actual start index of the type to be read.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.41 `virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShortAt (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException)` [virtual]

Writes two bytes containing the given value, into this buffer at the given byte index.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

6.114.3.42 `virtual void decaf::internal::util::ByteArrayAdapter::read (unsigned char * buffer, std::size_t offset, std::size_t length) const throw (decaf::lang::exceptions::NullPointerException, decaf::nio::BufferUnderflowException)` [virtual]

Reads from the Byte array starting at the specified offset and reading the specified length. If the length is greater than the capacity of this underlying byte array then an `BufferUnderflowException` is thrown.

Parameters:

buffer - the buffer to read data from this array into.

offset - position in this array to start reading from.

length - the amount of data to read from this array.

Exceptions:

NullPointerException if buffer is null

BufferUnderflowException if there is not enough data to read because the offset or the length is greater than the size of this array.

6.114.3.43 virtual void decaf::internal::util::ByteArrayAdapter::resize (std::size_t *capacity*) throw (lang::exceptions::InvalidStateException) [virtual]

Resizes the underlying array to the new given capacity, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved. A **ByteArrayAdapter** (p. 673) can only be resized when it owns the underlying array, if it does not then it will throw an *InvalidStateException*.

Parameters:

capacity - the new capacity of the array.

Exceptions:

InvalidStateException if this object does not own the buffer.

6.114.3.44 virtual void decaf::internal::util::ByteArrayAdapter::write (unsigned char * *buffer*, std::size_t *offset*, std::size_t *length*) throw (decaf::lang::exceptions::NullPointerException, decaf::nio::BufferOverflowException) [virtual]

Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects **internal** (p. 95) array. . If the length is greater than the capacity of this underlying byte array then an *BufferOverflowException* is thrown.

Parameters:

buffer - the buffer to write get data written into this array.

offset - position in this array to start writing from.

length - the amount of data to write to this array.

Exceptions:

NullPointerException if buffer is null

BufferOverflowException if the amount of data to be written to this array or the offset given are larger than this array's capacity.

The documentation for this class was generated from the following file:

Public Member Functions

- **ByteBuffer** (std::size_t capacity, bool readOnly=false)
*Creates a **ByteBuffer** (p. 694) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **ByteBuffer** (unsigned char *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)
*Creates a **ByteBuffer** (p. 694) object that wraps the given array.*
- **ByteBuffer** (ByteBufferPerspective &array, std::size_t offset, std::size_t length, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteBufferPerspective** (p. 729) and start at the given offset.*
- **ByteBuffer** (const ByteBuffer &other)
*Create a **ByteBuffer** (p. 694) that mirrors this one, meaning it shares a reference to this buffers **ByteBufferPerspective** (p. 729) and when changes are made to that data it is reflected in both.*
- virtual ~ByteBuffer ()
- virtual bool isReadOnly () const
Tells whether or not this buffer is read-only.
- virtual unsigned char * array () throw (decaf::nio::ReadOnlyBufferException, decaf::lang::exceptions::UnsupportedOperationException)
Returns the byte array that backs this buffer.
- virtual std::size_t arrayOffset () const throw (decaf::nio::ReadOnlyBufferException, lang::exceptions::UnsupportedOperationException)
Returns the offset within this buffer's backing array of the first element of the buffer.
- virtual bool hasArray () const
Tells whether or not this buffer is backed by an accessible byte array.
- virtual decaf::nio::CharBuffer * asCharBuffer () const
Creates a view of this byte buffer as a char buffer.
- virtual decaf::nio::DoubleBuffer * asDoubleBuffer () const
Creates a view of this byte buffer as a double buffer.
- virtual decaf::nio::FloatBuffer * asFloatBuffer () const

Creates a view of this byte buffer as a float buffer.

- virtual **decaf::nio::IntBuffer** * **asIntBuffer** () const
Creates a view of this byte buffer as a int buffer.
- virtual **decaf::nio::LongBuffer** * **asLongBuffer** () const
Creates a view of this byte buffer as a long buffer.
- virtual **decaf::nio::ShortBuffer** * **asShortBuffer** () const
Creates a view of this byte buffer as a short buffer.
- virtual **ByteBuffer** * **asReadOnlyBuffer** () const
Creates a new, read-only byte buffer that shares this buffer's content.
- virtual **ByteBuffer** & **compact** () throw (decaf::nio::ReadOnlyBufferException)
Compacts this buffer.
- virtual **ByteBuffer** * **duplicate** ()
Creates a new byte buffer that shares this buffer's content.
- virtual unsigned char **get** () const throw (decaf::nio::BufferUnderflowException)
Relative get method.
- virtual unsigned char **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual char **getChar** () throw (decaf::nio::BufferUnderflowException)
Reads the next byte at this buffer's current position, and then increments the position by one.
- virtual char **getChar** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads one byte at the given index and returns it.
- virtual double **getDouble** () throw (decaf::nio::BufferUnderflowException)
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual double **getDouble** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual float **getFloat** () throw (decaf::nio::BufferUnderflowException)
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual float **getFloat** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual long long **getLong** () throw (decaf::nio::BufferUnderflowException)

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

- virtual long long **getLong** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Reads eight bytes at the given index and returns it.

- virtual int **getInt** () throw (decaf::nio::BufferUnderflowException)

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

- virtual int **getInt** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Reads four bytes at the given index and returns it.

- virtual short **getShort** () throw (decaf::nio::BufferUnderflowException)

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

- virtual short **getShort** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Reads two bytes at the given index and returns it.

- virtual **ByteBuffer** & **put** (unsigned char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes the given byte into this buffer at the current position, and then increments the position.

- virtual **ByteBuffer** & **put** (std::size_t index, unsigned char value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes the given byte into this buffer at the given index.

- virtual **ByteBuffer** & **putChar** (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

- virtual **ByteBuffer** & **putChar** (std::size_t index, char value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes one byte containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putDouble** (double value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putDouble** (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putFloat** (float value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putFloat** (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putLong** (long long value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putLong** (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putInt** (int value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putInt** (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putShort** (short value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putShort** (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** * **slice** () const

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)

*Sets this **ByteBuffer** (p. 694) as Read-Only.*

6.115.1 Detailed Description

This class defines six categories of operations upon byte buffers:. 1. Absolute and relative get and put methods that read and write single bytes; 2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer;

4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 706) float getFloat(int index) void **putFloat(float f)** (p. 712) void putFloat(int index, float f)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The asFloatBuffer method, for example, creates an instance of the FloatBuffer class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

6.115.2 Constructor & Destructor Documentation

6.115.2.1 `decaf::internal::nio::ByteBuffer::ByteBuffer (std::size_t capacity, bool readOnly = false)`

Creates a **ByteBuffer** (p. 694) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.115.2.2 decaf::internal::nio::ByteBuffer::ByteBuffer (unsigned char * *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **ByteBuffer** (p. 694) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.115.2.3 decaf::internal::nio::ByteBuffer::ByteBuffer (ByteBufferPerspective & *array*, std::size_t *offset*, std::size_t *length*, bool *readOnly* = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteBufferPerspective** (p. 729) and start at the given offset. The capacity and limit of the new **ByteBuffer** (p. 694) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteBufferPerspective** (p. 729) to wrap

offset - the offset into array where the buffer starts

length - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.115.2.4 decaf::internal::nio::ByteBuffer::ByteBuffer (const ByteBuffer & *other*)

Create a **ByteBuffer** (p. 694) that mirrors this one, meaning it shares a reference to this buffers **ByteBufferPerspective** (p. 729) and when changes are made to that data it is reflected in both.

Parameters:

other - the **ByteBuffer** (p. 694) this one is to mirror.

6.115.2.5 `virtual decaf::internal::nio::ByteBuffer::~~ByteBuffer ()`
[virtual]

6.115.3 Member Function Documentation

6.115.3.1 `virtual unsigned char* decaf::internal::nio::ByteBuffer::array`
`() throw (decaf::nio::ReadOnlyBufferException,`
`decaf::lang::exceptions::UnsupportedOperationException)` [virtual]

Returns the byte array that backs this buffer. Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The array that backs this buffer

Exceptions:

ReadOnlyBufferException - If this buffer is backed by an array but is read-only

UnsupportedOperationException - If this buffer is not backed by an accessible array

Implements `decaf::nio::ByteBuffer` (p. 739).

6.115.3.2 `virtual std::size_t decaf::internal::nio::ByteBuffer::arrayOffset`
`() const throw (decaf::nio::ReadOnlyBufferException,`
`lang::exceptions::UnsupportedOperationException)` [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer. If this buffer is backed by an array then buffer position `p` corresponds to array index `p + arrayOffset()` (p. 700).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset within this buffer's array of the first element of the buffer

Exceptions:

ReadOnlyBufferException - If this buffer is backed by an array but is read-only

UnsupportedOperationException - If this buffer is not backed by an accessible array

Implements `decaf::nio::ByteBuffer` (p. 740).

6.115.3.3 `virtual decaf::nio::CharBuffer* de-`
`caf::internal::nio::ByteBuffer::asCharBuffer () const`
[inline, virtual]

Creates a view of this byte buffer as a char buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new Char Buffer, which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 740).

6.115.3.4 virtual decaf::nio::DoubleBuffer* decaf::internal::nio::ByteBuffer::asDoubleBuffer () const [inline, virtual]

Creates a view of this byte buffer as a double buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new double Buffer, which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 740).

6.115.3.5 virtual decaf::nio::FloatBuffer* decaf::internal::nio::ByteBuffer::asFloatBuffer () const [inline, virtual]

Creates a view of this byte buffer as a float buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new float Buffer, which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 741).

6.115.3.6 virtual decaf::nio::IntBuffer* decaf::internal::nio::ByteBuffer::asIntBuffer () const [inline, virtual]

Creates a view of this byte buffer as a int buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new `int Buffer`, which the caller then owns.

Implements `decaf::nio::ByteBuffer` (p. 741).

6.115.3.7 `virtual decaf::nio::LongBuffer* decaf::internal::nio::ByteBuffer::asLongBuffer () const`
[inline, virtual]

Creates a view of this byte buffer as a long buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new long `Buffer`, which the caller then owns.

Implements `decaf::nio::ByteBuffer` (p. 741).

6.115.3.8 `virtual ByteBuffer* decaf::internal::nio::ByteBuffer::asReadOnlyBuffer () const`
[virtual]

Creates a new, read-only byte buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only byte buffer which the caller then owns.

Implements `decaf::nio::ByteBuffer` (p. 742).

6.115.3.9 `virtual decaf::nio::ShortBuffer* decaf::internal::nio::ByteBuffer::asShortBuffer () const`
[inline, virtual]

Creates a view of this byte buffer as a short buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new short Buffer, which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 742).

6.115.3.10 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 631) - 1 is copied to index $n = \text{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ByteBuffer** (p. 694)

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 742).

6.115.3.11 virtual ByteBuffer* decaf::internal::nio::ByteBuffer::duplicate () [virtual]

Creates a new byte buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new Byte Buffer which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 743).

6.115.3.12 virtual unsigned char decaf::internal::nio::ByteBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method. Reads the byte at the given index.

Parameters:

index - the index in the Buffer where the byte is to be read

Returns:

the byte that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::ByteBuffer** (p. 743).

6.115.3.13 `virtual unsigned char decaf::internal::nio::ByteBuffer::get () const throw (decaf::nio::BufferUnderflowException) [virtual]`

Relative get method. Reads the byte at this buffer's current position, and then increments the position.

Returns:

The byte at the buffer's current position

Exceptions:

BufferUnderflowException - If the buffer's current position is not smaller than its limit

Implements **decaf::nio::ByteBuffer** (p. 744).

6.115.3.14 `virtual char decaf::internal::nio::ByteBuffer::getChar (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Reads one byte at the given index and returns it.

Parameters:

index - the index in the Buffer where the byte is to be read

Returns:

the char at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::ByteBuffer** (p. 745).

6.115.3.15 `virtual char decaf::internal::nio::ByteBuffer::getChar () throw (decaf::nio::BufferUnderflowException) [inline, virtual]`

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns:

the next char in the buffer..

Exceptions:

BufferUnderflowException - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 745).

6.115.3.16 virtual double decaf::internal::nio::ByteBuffer::getDouble (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Reads eight bytes at the given index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the double at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implements **decaf::nio::ByteBuffer** (p. 746).

6.115.3.17 virtual double decaf::internal::nio::ByteBuffer::getDouble () throw (decaf::nio::BufferUnderflowException) [virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next double in the buffer..

Exceptions:

BufferUnderflowException - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 746).

6.115.3.18 virtual float decaf::internal::nio::ByteBuffer::getFloat (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Reads four bytes at the given index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the float at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implements **decaf::nio::ByteBuffer** (p. 746).

6.115.3.19 **virtual float decaf::internal::nio::ByteArrayBuffer::getFloat () throw (decaf::nio::BufferUnderflowException) [virtual]**

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next float in the buffer..

Exceptions:

BufferUnderflowException - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 747).

6.115.3.20 **virtual int decaf::internal::nio::ByteArrayBuffer::getInt (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]**

Reads four bytes at the given index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the int at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implements **decaf::nio::ByteBuffer** (p. 747).

6.115.3.21 `virtual int decaf::internal::nio::ByteBuffer::getInt () throw (decaf::nio::BufferUnderflowException) [virtual]`

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next int in the buffer..

Exceptions:

BufferUnderflowException - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 747).

6.115.3.22 `virtual long long decaf::internal::nio::ByteBuffer::getLong (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]`

Reads eight bytes at the given index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the long long at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implements **decaf::nio::ByteBuffer** (p. 748).

6.115.3.23 `virtual long long decaf::internal::nio::ByteBuffer::getLong () throw (decaf::nio::BufferUnderflowException) [virtual]`

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next long long in the buffer..

Exceptions:

BufferUnderflowException - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 748).

6.115.3.24 `virtual short decaf::internal::nio::ByteBuffer::getShort (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Reads two bytes at the given index and returns it.

Parameters:

index - the index in the Buffer where the bytes are to be read

Returns:

the short at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implements `decaf::nio::ByteBuffer` (p. 748).

6.115.3.25 `virtual short decaf::internal::nio::ByteBuffer::getShort () throw (decaf::nio::BufferUnderflowException)` [virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next short in the buffer..

Exceptions:

BufferUnderflowException - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements `decaf::nio::ByteBuffer` (p. 749).

6.115.3.26 `virtual bool decaf::internal::nio::ByteBuffer::hasArray () const`
[inline, virtual]

Tells whether or not this buffer is backed by an accessible byte array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements `decaf::nio::ByteBuffer` (p. 749).

6.115.3.27 `virtual bool decaf::internal::nio::ByteBuffer::isReadOnly () const`
[inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 749).

6.115.3.28 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::put
(std::size_t index, unsigned char value) throw
(lang::exceptions::IndexOutOfBoundsException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given byte into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the byte to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 750).

6.115.3.29 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::put
(unsigned char value) throw (decaf::nio::BufferOverflowException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters:

value - the byte value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 750).

6.115.3.30 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putChar (std::size_t index, char value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes one byte containing the given value, into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException - If this buffer is read-only

Implements `decaf::nio::ByteBuffer` (p. 752).

6.115.3.31 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putChar (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException - If this buffer is read-only

Implements `decaf::nio::ByteBuffer` (p. 752).

6.115.3.32 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putDouble (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 753).

6.115.3.33 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putDouble (double *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 753).

6.115.3.34 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putFloat (std::size_t *index*, float *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 754).

6.115.3.35 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putFloat (float *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]**

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 754).

6.115.3.36 **virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putInt (std::size_t *index*, int *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]**

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 754).

6.115.3.37 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putInt (int *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException - If this buffer is read-only

Implements decaf::nio::ByteBuffer (p. 755).

6.115.3.38 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putLong (std::size_t *index*, long long *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements decaf::nio::ByteBuffer (p. 755).

6.115.3.39 virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putLong (long long *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 756).

6.115.3.40 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putShort (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes two bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 756).

6.115.3.41 `virtual ByteBuffer& decaf::internal::nio::ByteBuffer::putShort (short value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 756).

6.115.3.42 `virtual void decaf::internal::nio::ByteBuffer::setReadOnly (bool value) [inline, protected, virtual]`

Sets this **ByteBuffer** (p. 694) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.115.3.43 `virtual ByteBuffer* decaf::internal::nio::ByteBuffer::slice () const [virtual]`

Creates a new byte buffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ByteBuffer** (p. 694) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 757).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/ByteBuffer.h`

6.116 decaf::io::ByteArrayInputStream Class Reference

Simple implementation of **InputStream** (p.1406) that wraps around an STL Vector `std::vector<unsigned char>`.

`#include <src/main/decaf/io/ByteArrayInputStream.h>` Inheritance diagram for `decaf::io::ByteArrayInputStream`:

Public Member Functions

- **ByteArrayInputStream** ()
Default Constructor.
- **ByteArrayInputStream** (const std::vector< unsigned char > &buffer)
Creates the input stream and calls setBuffer with the specified buffer object.
- **ByteArrayInputStream** (const unsigned char *buffer, std::size_t bufferSize)
Constructor.
- virtual ~**ByteArrayInputStream** ()
- virtual void **setBuffer** (const std::vector< unsigned char > &buffer)
*Sets the **internal** (p. 95) buffer.*
- virtual void **setByteArray** (const unsigned char *buffer, std::size_t bufferSize)
Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.
- virtual std::size_t **available** () const throw (IOException)
Indicates the number of bytes available.
- virtual unsigned char **read** () throw (IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (IOException, lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual void **close** () throw (lang::Exception)
Closes the target input stream.
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual void **mark** (int readLimit DECAF_UNUSED)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (IOException)

Resets the read index to the beginning of the byte array, unless mark has been called and the markLimit has not been exceeded, in which case the stream is reset to the marked position.

- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

Protected Member Functions

- virtual void **lock** () throw (lang::Exception)

Locks the object.

- virtual void **unlock** () throw (lang::Exception)

Unlocks the object.

- virtual void **wait** () throw (lang::Exception)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (lang::Exception)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (lang::Exception)

Signals the waiters on this object that it can now wake up and continue.

6.116.1 Detailed Description

Simple implementation of **InputStream** (p.1406) that wraps around an STL Vector `std::vector<unsigned char>`. Closing a **ByteArrayInputStream** (p.716) has no effect. The methods in this class can be called after the stream has been closed without generating an **IOException** (p.1477).

6.116.2 Constructor & Destructor Documentation

6.116.2.1 decaf::io::ByteArrayInputStream::ByteArrayInputStream ()

Default Constructor.

6.116.2.2 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const std::vector< unsigned char > & buffer)

Creates the input stream and calls setBuffer with the specified buffer object.

Parameters:

buffer The buffer to be used.

6.116.2.3 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * *buffer*, std::size_t *bufferSize*)

Constructor.

Parameters:

buffer initial byte array to use to read from

bufferSize the size of the buffer

6.116.2.4 virtual decaf::io::ByteArrayInputStream::~~ByteArrayInputStream () [virtual]

6.116.3 Member Function Documentation

6.116.3.1 virtual std::size_t decaf::io::ByteArrayInputStream::available () const throw (IOException) [inline, virtual]

Indicates the number of bytes available.

Returns:

The number of bytes until the end of the **internal** (p. 95) buffer.

Implements **decaf::io::InputStream** (p. 1407).

6.116.3.2 virtual void decaf::io::ByteArrayInputStream::close () throw (lang::Exception) [inline, virtual]

Closes the target input stream.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implements **decaf::io::Closeable** (p. 840).

6.116.3.3 virtual void decaf::io::ByteArrayInputStream::lock () throw (lang::Exception) [inline, protected, virtual]

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.116.3.4 virtual void decaf::io::ByteArrayInputStream::mark (int readLimit *DECAF_UNUSED*) [inline, virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream

instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1407).

6.116.3.5 virtual bool decaf::io::ByteArrayInputStream::markSupported () const
[inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1407).

6.116.3.6 virtual void decaf::io::ByteArrayInputStream::notify () throw (
lang::Exception) [inline, protected, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.116.3.7 virtual void decaf::io::ByteArrayInputStream::notifyAll () throw (
lang::Exception) [inline, protected, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.116.3.8 virtual int decaf::io::ByteArrayInputStream::read (unsigned char *
buffer, std::size_t offset, std::size_t bufferSize) throw (IOException,
lang::exceptions::NullPointerException) [virtual]

Reads an array of bytes from the buffer.

Parameters:

buffer (out) the target buffer.

offset the position in the buffer to start reading from.

bufferSize the size of the output buffer.

Returns:

The number of bytes read.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1408).

6.116.3.9 virtual unsigned char decaf::io::ByteArrayInputStream::read () throw (IOException) [virtual]

Reads a single byte from the buffer.

Returns:

The next byte.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1408).

6.116.3.10 virtual void decaf::io::ByteArrayInputStream::reset () throw (IOException) [virtual]

Resets the read index to the beginning of the byte array, unless mark has been called and the markLimit has not been exceeded, in which case the stream is reset to the marked position.

Implements **decaf::io::InputStream** (p. 1408).

6.116.3.11 virtual void decaf::io::ByteArrayInputStream::setBuffer (const std::vector< unsigned char > & buffer) [virtual]

Sets the **internal** (p. 95) buffer. The input stream will wrap around this buffer and will perform all read operations on it. The position will be reinitialized to the beginning of the specified buffer. This class will not own the given buffer - it is the caller's responsibility to free the memory of the given buffer as appropriate.

Parameters:

buffer The buffer to be used.

6.116.3.12 virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char * buffer, std::size_t bufferSize) [virtual]

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters:*buffer* initial byte array to use to read from*bufferSize* the size of the buffer

6.116.3.13 `virtual std::size_t decaf::io::ByteArrayInputStream::skip
(std::size_t num) throw (io::IOException,
lang::exceptions::UnsupportedOperationException) [virtual]`

Skips over and discards *n* bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If *n* is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1406) creates a byte array and then repeatedly reads into it until *n* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:*num* - the number of bytes to skip**Returns:**

total bytes skipped

Exceptions:*IOException* (p. 1477) if an error occursImplements **decaf::io::InputStream** (p. 1409).

6.116.3.14 `virtual void decaf::io::ByteArrayInputStream::unlock () throw (
lang::Exception) [inline, protected, virtual]`

Unlocks the object.

Exceptions:*Exception*Implements **decaf::util::concurrent::Synchronizable** (p. 2512).

6.116.3.15 `virtual void decaf::io::ByteArrayInputStream::wait (unsigned long
millisecs) throw (lang::Exception) [inline, protected, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:*millisecs* the time in milliseconds to wait, or WAIT_INFINITE**Exceptions:***Exception*

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.116.3.16 **virtual void decaf::io::ByteArrayInputStream::wait () throw (**
 lang::Exception) [inline, protected, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**ByteArrayInputStream.h**

6.117 decaf::io::ByteArrayOutputStream Class Reference

#include <src/main/decaf/io/ByteArrayOutputStream.h> Inheritance diagram for decaf::io::ByteArrayOutputStream:

Public Member Functions

- **ByteArrayOutputStream** ()
*Default Constructor - uses a default **internal** (p. 95) buffer.*
- **ByteArrayOutputStream** (std::vector< unsigned char > &buffer)
Uses the given buffer as the target.
- virtual ~**ByteArrayOutputStream** ()
- virtual void **setBuffer** (std::vector< unsigned char > &buffer)
*Sets the **internal** (p. 95) buffer.*
- virtual const unsigned char * **toByteArray** () const
Get a snapshot of the data.
- virtual std::size_t **size** () const
Get the Size of the Internal Buffer.
- virtual void **write** (unsigned char c) throw (IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (IOException, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** () throw (IOException)
Invokes flush on the target output stream, has no affect.
- virtual void **reset** () throw (IOException)
Clear current Stream contents.
- void **close** () throw (lang::Exception)
Invokes close on the target output stream.
- std::string **toString** () const
Converts the bytes in the buffer into a standard C++ string.
- void **writeTo** (**OutputStream** *out) const throw (IOException, lang::exceptions::NullPointerException)

Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using `out.write(buf, 0, count)`.

- virtual void **lock** () throw (lang::Exception)
Locks the object.
- virtual void **unlock** () throw (lang::Exception)
Unlocks the object.
- virtual void **wait** () throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (lang::Exception)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (lang::Exception)
Signals the waiters on this object that it can now wake up and continue.

6.117.1 Constructor & Destructor Documentation

6.117.1.1 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream ()

Default Constructor - uses a default **internal** (p. 95) buffer.

6.117.1.2 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream (std::vector< unsigned char > & *buffer*)

Uses the given buffer as the target. Calls setBuffer.

Parameters:

buffer the target buffer.

6.117.1.3 virtual decaf::io::ByteArrayOutputStream::~~ByteArrayOutputStream () [inline, virtual]

6.117.2 Member Function Documentation

6.117.2.1 void decaf::io::ByteArrayOutputStream::close () throw (lang::Exception) [inline, virtual]

Invokes close on the target output stream.

Exceptions:

CMSEException

Implements **decaf::io::Closeable** (p. 840).

6.117.2.2 virtual void decaf::io::ByteArrayOutputStream::flush () throw (IOException) [inline, virtual]

Invokes flush on the target output stream, has no affect.

Exceptions:

IOException (p. 1477)

Implements **decaf::io::OutputStream** (p. 1992).

6.117.2.3 virtual void decaf::io::ByteArrayOutputStream::lock () throw (lang::Exception) [inline, virtual]

Locks the object.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2508).

6.117.2.4 virtual void decaf::io::ByteArrayOutputStream::notify () throw (lang::Exception) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2510).

6.117.2.5 virtual void decaf::io::ByteArrayOutputStream::notifyAll () throw (lang::Exception) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2511).

6.117.2.6 virtual void decaf::io::ByteArrayOutputStream::reset () throw (IOException) [virtual]

Clear current Stream contents.

Exceptions:

IOException (p. 1477)

6.117.2.7 `virtual void decaf::io::ByteArrayOutputStream::setBuffer (std::vector< unsigned char > & buffer) [virtual]`

Sets the **internal** (p.95) buffer. This input stream will wrap around the given buffer and all writes will be performed directly on the buffer. This object does not retain control of the buffer's lifetime however - this is the job of the caller.

Parameters:

buffer The target buffer.

6.117.2.8 `virtual std::size_t decaf::io::ByteArrayOutputStream::size () const [inline, virtual]`

Get the Size of the Internal Buffer.

Returns:

size of the **internal** (p.95) buffer

6.117.2.9 `virtual const unsigned char* decaf::io::ByteArrayOutputStream::toByteArray () const [inline, virtual]`

Get a snapshot of the data.

Returns:

pointer to the data

6.117.2.10 `std::string decaf::io::ByteArrayOutputStream::toString () const`

Converts the bytes in the buffer into a standard C++ string.

Returns:

a string containing the bytes in the buffer

6.117.2.11 `virtual void decaf::io::ByteArrayOutputStream::unlock () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p.2512).

6.117.2.12 virtual void decaf::io::ByteArrayOutputStream::wait (unsigned long *milliseconds*) throw (lang::Exception) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements decaf::util::concurrent::Synchronizable (p. 2513).

6.117.2.13 virtual void decaf::io::ByteArrayOutputStream::wait () throw (lang::Exception) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements decaf::util::concurrent::Synchronizable (p. 2514).

6.117.2.14 virtual void decaf::io::ByteArrayOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException (p. 1477) thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implements decaf::io::OutputStream (p. 1993).

6.117.2.15 virtual void decaf::io::ByteArrayOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [virtual]

Writes an array of bytes to the output stream.

buffer The bytes to write.

IOException (p. 1477) thrown if an error occurs.

```
6.117.2.16 virtual void decaf::io::ByteArrayOutputStream::write (unsigned char c)
throw ( IOException ) [virtual]
```

c the byte.

IOException (p. 1477) thrown if an error occurs.

```
6.117.2.17 void decaf::io::ByteArrayOutputStream::writeTo (OutputStream * out)
const throw ( IOException, lang::exceptions::NullPointerException )
```

Creates a array object that wraps the given array.
- virtual ~**ByteArrayPerspective** ()
- **ByteArrayPerspective * takeRef** ()
Takes a reference to this Perspective and returns a pointer to this so that a caller can take a ref and get a ref in one call.

- void **returnRef** ()

Returns a reference to this Perspective, when the count is zero it should be deleted.

- int **getReferences** () const

6.118.1 Detailed Description

This class extends ByteArray to create a reference counted byte array that can be held and used by several different ByteBuffers and allow them to know on destruction whose job it is to delete the perspective. Creating an instance of this class implicitly takes a reference to it, so a creator must return its ref before the count will be zero.

6.118.2 Constructor & Destructor Documentation

6.118.2.1 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (std::size_t *capacity*)

Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

6.118.2.2 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (unsigned char * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a byte array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.118.2.3 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (char * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.118.2.4 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (double * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.118.2.5 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (float * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.118.2.6 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (long long * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.118.2.7 `decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective` (int * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.118.2.8 `decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective` (short * *array*, std::size_t *capacity*, bool *own* = false) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions:

NullPointerException if buffer is NULL

6.118.2.9 `virtual` `decaf::internal::nio::ByteArrayPerspective::~~ByteArrayPerspective ()` [inline, virtual]

6.118.3 Member Function Documentation

6.118.3.1 `int decaf::internal::nio::ByteArrayPerspective::getReferences () const` [inline]

Returns:

the current number of reference on this perspective

6.118.3.2 void decaf::internal::nio::ByteArrayPerspective::returnRef () [inline]

Returns a reference to this Perspective, when the count is zero it should be deleted.

6.118.3.3 ByteArrayPerspective* decaf::internal::nio::ByteArrayPerspective::takeRef () [inline]

Takes a reference to this Perspective and returns a pointer to this so that a caller can take a ref and get a ref in one call.

Returns:

this

6.119 decaf::nio::ByteBuffer Class Reference

This class defines six categories of operations upon byte buffers:.

#include <src/main/decaf/nio/ByteBuffer.h> Inheritance diagram for decaf::nio::ByteBuffer:

Public Member Functions

- virtual **~ByteBuffer** ()
- virtual std::string **toString** () const
- **ByteBuffer** & **get** (std::vector< unsigned char > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **ByteBuffer** & **get** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- **ByteBuffer** & **put** (**ByteBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the bytes remaining in the given source buffer into this buffer.
- **ByteBuffer** & **put** (const unsigned char *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers bytes into this buffer from the given source array.
- **ByteBuffer** & **put** (std::vector< unsigned char > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source byte array into this buffer.
- virtual bool **isReadOnly** () const =0
Tells whether or not this buffer is read-only.
- virtual unsigned char * **array** ()=0 throw (ReadOnlyBufferException, lang::exceptions::UnsupportedOperationException)
Returns the byte array that backs this buffer.
- virtual std::size_t **arrayOffset** () const =0 throw (ReadOnlyBufferException, lang::exceptions::UnsupportedOperationException)
Returns the offset within this buffer's backing array of the first element of the buffer.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible byte array.
- virtual **CharBuffer** * **asCharBuffer** () const =0
Creates a view of this byte buffer as a char buffer.

- virtual **DoubleBuffer** * **asDoubleBuffer** () const =0
Creates a view of this byte buffer as a double buffer.
- virtual **FloatBuffer** * **asFloatBuffer** () const =0
Creates a view of this byte buffer as a float buffer.
- virtual **IntBuffer** * **asIntBuffer** () const =0
Creates a view of this byte buffer as a int buffer.
- virtual **LongBuffer** * **asLongBuffer** () const =0
Creates a view of this byte buffer as a long buffer.
- virtual **ShortBuffer** * **asShortBuffer** () const =0
Creates a view of this byte buffer as a short buffer.
- virtual **ByteBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only byte buffer that shares this buffer's content.
- virtual **ByteBuffer** & **compact** ()=0 throw (**ReadOnlyBufferException**)
Compacts this buffer.
- virtual **ByteBuffer** * **duplicate** ()=0
Creates a new byte buffer that shares this buffer's content.
- virtual unsigned char **get** () const =0 throw (**BufferUnderflowException**)
Relative get method.
- virtual unsigned char **get** (std::size_t index) const =0 throw (**lang::exceptions::IndexOutOfBoundsException**)
Absolute get method.
- virtual char **getChar** ()=0 throw (**BufferUnderflowException**)
Reads the next byte at this buffer's current position, and then increments the position by one.
- virtual char **getChar** (std::size_t index) const =0 throw (**lang::exceptions::IndexOutOfBoundsException**)
Reads one byte at the given index and returns it.
- virtual double **getDouble** ()=0 throw (**BufferUnderflowException**)
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual double **getDouble** (std::size_t index) const =0 throw (**lang::exceptions::IndexOutOfBoundsException**)
Reads eight bytes at the given index and returns it.
- virtual float **getFloat** ()=0 throw (**BufferUnderflowException**)
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

- virtual float **getFloat** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual long long **getLong** ()=0 throw (BufferUnderflowException)
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual long long **getLong** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual int **getInt** ()=0 throw (BufferUnderflowException)
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual int **getInt** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual short **getShort** ()=0 throw (BufferUnderflowException)
Reads the next two bytes at this buffer's current position, and then increments the position by that amount.
- virtual short **getShort** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads two bytes at the given index and returns it.
- virtual **ByteBuffer** & **put** (unsigned char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given byte into this buffer at the current position, and then increments the position.
- virtual **ByteBuffer** & **put** (std::size_t index, unsigned char value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given byte into this buffer at the given index.
- virtual **ByteBuffer** & **putChar** (char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.
- virtual **ByteBuffer** & **putChar** (std::size_t index, char value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes one byte containing the given value, into this buffer at the given index.
- virtual **ByteBuffer** & **putDouble** (double value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer** & **putDouble** (std::size_t index, double value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putFloat** (float value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putFloat** (std::size_t index, float value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putLong** (long long value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putLong** (std::size_t index, long long value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)

Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putInt** (int value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putInt** (std::size_t index, int value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)

Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putShort** (short value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putShort** (std::size_t index, short value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)

Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** * **slice** () const =0

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

- virtual int **compareTo** (const **ByteBuffer** &value) const

Compares this object with the specified object for order.

- virtual bool **equals** (const **ByteBuffer** &value) const

- virtual bool **operator==** (const **ByteBuffer** &value) const

Compares equality between this object and the one passed.

- virtual bool **operator<** (const **ByteBuffer** &value) const

Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **ByteBuffer** * **allocate** (std::size_t capacity)
Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **ByteBuffer** * **wrap** (unsigned char *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **ByteBuffer** (p. 734).*
- static **ByteBuffer** * **wrap** (std::vector< unsigned char > &buffer)
*Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 734).*

Protected Member Functions

- **ByteBuffer** (std::size_t capacity)
*Creates a **ByteBuffer** (p. 734) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.119.1 Detailed Description

This class defines six categories of operations upon byte buffers:. 1. Absolute and relative get and put methods that read and write single bytes; 2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer; 4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 747) float getFloat(int index) void **putFloat(float f)** (p. 754) void putFloat(int index, float f)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in

the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The `asFloatBuffer` method, for example, creates an instance of the **FloatBuffer** (p. 1346) class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types `char`, `short`, `int`, `long`, and `double`.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

6.119.2 Constructor & Destructor Documentation

6.119.2.1 `decaf::nio::ByteBuffer::ByteBuffer (std::size_t capacity)` [protected]

Creates a **ByteBuffer** (p. 734) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

6.119.2.2 `virtual decaf::nio::ByteBuffer::~~ByteBuffer ()` [inline, virtual]

6.119.3 Member Function Documentation

6.119.3.1 `static ByteBuffer* decaf::nio::ByteBuffer::allocate (std::size_t capacity)` [static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters:

capacity - the **internal** (p. 95) buffer's capacity.

Returns:

a newly allocated **ByteBuffer** (p. 734) which the caller owns.

6.119.3.2 `virtual unsigned char* decaf::nio::ByteBuffer::array () throw (ReadOnly-BufferException, lang::exceptions::UnsupportedOperationException)` [pure virtual]

Returns the byte array that backs this buffer. Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The array that backs this buffer

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is backed by an array but is read-only

UnsupportedOperationException - If this buffer is not backed by an accessible array

Implemented in **decaf::internal::nio::ByteBuffer** (p. 700).

6.119.3.3 `virtual std::size_t decaf::nio::ByteBuffer::arrayOffset
() const throw (ReadOnlyBufferException,
lang::exceptions::UnsupportedOperationException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer. If this buffer is backed by an array then buffer position *p* corresponds to array index *p* + **arrayOffset()** (p. 740).

Invoke the **hasArray** method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset within this buffer's array of the first element of the buffer

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is backed by an array but is read-only

UnsupportedOperationException - If this buffer is not backed by an accessible array

Implemented in **decaf::internal::nio::ByteBuffer** (p. 700).

6.119.3.4 `virtual CharBuffer* decaf::nio::ByteBuffer::asCharBuffer () const [pure
virtual]`

Creates a view of this byte buffer as a char buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new **Char Buffer** (p. 627), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 700).

6.119.3.5 `virtual DoubleBuffer* decaf::nio::ByteBuffer::asDoubleBuffer () const
[pure virtual]`

Creates a view of this byte buffer as a double buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new double **Buffer** (p. 627), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 701).

6.119.3.6 virtual FloatBuffer* decaf::nio::ByteBuffer::asFloatBuffer () const [pure virtual]

Creates a view of this byte buffer as a float buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new float **Buffer** (p. 627), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 701).

6.119.3.7 virtual IntBuffer* decaf::nio::ByteBuffer::asIntBuffer () const [pure virtual]

Creates a view of this byte buffer as a int buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new int **Buffer** (p. 627), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 701).

6.119.3.8 virtual LongBuffer* decaf::nio::ByteBuffer::asLongBuffer () const [pure virtual]

Creates a view of this byte buffer as a long buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new long **Buffer** (p. 627), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 702).

6.119.3.9 **virtual ByteBuffer* decaf::nio::ByteBuffer::asReadOnlyBuffer () const** [pure virtual]

Creates a new, read-only byte buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only byte buffer which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 702).

6.119.3.10 **virtual ShortBuffer* decaf::nio::ByteBuffer::asShortBuffer () const** [pure virtual]

Creates a view of this byte buffer as a short buffer. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the new short **Buffer** (p. 627), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 702).

6.119.3.11 **virtual ByteBuffer& decaf::nio::ByteBuffer::compact () throw (** **ReadOnlyBufferException)** [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 631) - 1 is copied to index $n = \text{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n + 1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ByteBuffer** (p. 734)

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 703).

6.119.3.12 virtual int decaf::nio::ByteBuffer::compareTo (const ByteBuffer & value) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.119.3.13 virtual ByteBuffer* decaf::nio::ByteBuffer::duplicate () [pure virtual]

Creates a new byte buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new Byte **Buffer** (p. 627) which the caller owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 703).

6.119.3.14 virtual bool decaf::nio::ByteBuffer::equals (const ByteBuffer & value) const [virtual]**Returns:**

true if this value is considered equal to the passed value.

6.119.3.15 virtual unsigned char decaf::nio::ByteBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the byte at the given index.

Parameters:

index - the index in the **Buffer** (p. 627) where the byte is to be read

Returns:

the byte that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::ByteBuffer** (p. 703).

6.119.3.16 **virtual unsigned char decaf::nio::ByteBuffer::get () const throw (BufferUnderflowException)** [pure virtual]

Relative get method. Reads the byte at this buffer's current position, and then increments the position.

Returns:

The byte at the buffer's current position

Exceptions:

BufferUnderflowException (p. 661) - If the buffer's current position is not smaller than its limit

Implemented in **decaf::internal::nio::ByteBuffer** (p. 704).

6.119.3.17 **ByteBuffer& decaf::nio::ByteBuffer::get (unsigned char * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)**

Relative bulk get method. This method transfers bytes from this buffer into the given destination array. If there are fewer bytes remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 632), then no bytes are transferred and a **BufferUnderflowException** (p. 661) is thrown.

Otherwise, this method copies `length` bytes from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than `length` bytes remaining in this buffer

NullPointerException if the passed buffer is null.

6.119.3.18 ByteBuffer& decaf::nio::ByteBuffer::get (std::vector< unsigned char > *buffer*) throw (*BufferUnderflowException*)

Relative bulk get method. This method transfers bytes from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns:

a reference to this Byte **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than length bytes remaining in this buffer

6.119.3.19 virtual char decaf::nio::ByteBuffer::getChar (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Reads one byte at the given index and returns it.

Parameters:

index - the index in the **Buffer** (p. 627) where the byte is to be read

Returns:

the char at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::ByteBuffer** (p. 704).

6.119.3.20 virtual char decaf::nio::ByteBuffer::getChar () throw (*BufferUnderflowException*) [pure virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns:

the next char in the buffer..

Exceptions:

BufferUnderflowException (p. 661) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 704).

6.119.3.21 `virtual double decaf::nio::ByteBuffer::getDouble (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Reads eight bytes at the given index and returns it.

Parameters:

index - the index in the **Buffer** (p. 627) where the bytes are to be read

Returns:

the double at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 705).

6.119.3.22 `virtual double decaf::nio::ByteBuffer::getDouble () throw (BufferUnderflowException) [pure virtual]`

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next double in the buffer..

Exceptions:

BufferUnderflowException (p. 661) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 705).

6.119.3.23 `virtual float decaf::nio::ByteBuffer::getFloat (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Reads four bytes at the given index and returns it.

Parameters:

index - the index in the **Buffer** (p. 627) where the bytes are to be read

Returns:

the float at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 705).

6.119.3.24 virtual float decaf::nio::ByteBuffer::getFloat () throw (BufferUnderflowException) [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next float in the buffer..

Exceptions:

BufferUnderflowException (p. 661) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 706).

6.119.3.25 virtual int decaf::nio::ByteBuffer::getInt (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Reads four bytes at the given index and returns it.

Parameters:

index - the index in the **Buffer** (p. 627) where the bytes are to be read

Returns:

the int at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 706).

6.119.3.26 virtual int decaf::nio::ByteBuffer::getInt () throw (BufferUnderflowException) [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next int in the buffer..

Exceptions:

BufferUnderflowException (p. 661) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 707).

6.119.3.27 `virtual long long decaf::nio::ByteBuffer::getLong (std::size_t index)
const throw (lang::exceptions::IndexOutOfBoundsException) [pure
virtual]`

Reads eight bytes at the given index and returns it.

Parameters:

index - the index in the **Buffer** (p. 627) where the bytes are to be read

Returns:

the long long at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 707).

6.119.3.28 `virtual long long decaf::nio::ByteBuffer::getLong () throw (
BufferUnderflowException) [pure virtual]`

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next long long in the buffer..

Exceptions:

BufferUnderflowException (p. 661) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 707).

6.119.3.29 `virtual short decaf::nio::ByteBuffer::getShort (std::size_t index)
const throw (lang::exceptions::IndexOutOfBoundsException) [pure
virtual]`

Reads two bytes at the given index and returns it.

Parameters:

index - the index in the **Buffer** (p. 627) where the bytes are to be read

Returns:

the short at the given index in the buffer

Exceptions:

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 708).

6.119.3.30 virtual short decaf::nio::ByteBuffer::getShort () throw (BufferUnderflowException) [pure virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns:

the next short in the buffer..

Exceptions:

BufferUnderflowException (p. 661) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 708).

6.119.3.31 virtual bool decaf::nio::ByteBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible byte array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 708).

6.119.3.32 virtual bool decaf::nio::ByteBuffer::isReadOnly () const [pure virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 630).

Implemented in **decaf::internal::nio::ByteBuffer** (p. 708).

6.119.3.33 virtual bool decaf::nio::ByteBuffer::operator< (const ByteBuffer & value) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.119.3.34 `virtual bool decaf::nio::ByteBuffer::operator==(const ByteBuffer & value) const` [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.119.3.35 `virtual ByteBuffer& decaf::nio::ByteBuffer::put (std::size_t index, unsigned char value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given byte into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data
value - the byte to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::ByteArrayBuffer` (p. 709).

6.119.3.36 `virtual ByteBuffer& decaf::nio::ByteBuffer::put (unsigned char value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters:

value - the byte value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::ByteArrayBuffer` (p. 709).

6.119.3.37 ByteBuffer& decaf::nio::ByteBuffer::put (std::vector< unsigned char > & *buffer*) throw (**BufferOverflowException**, **ReadOnlyBufferException**)

This method transfers the entire content of the given source byte array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size())

Parameters:

buffer - The buffer whose contents are copied to this **ByteBuffer** (p. 734)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.119.3.38 ByteBuffer& decaf::nio::ByteBuffer::put (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *length*) throw (**BufferOverflowException**, **ReadOnlyBufferException**, lang::exceptions::NullPointerException)

This method transfers bytes into this buffer from the given source array. If there are more bytes to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 632), then no bytes are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer - The array from which bytes are to be read

offset - The offset within the array of the first byte to be read;

length - The number of bytes to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.119.3.39 ByteBuffer& decaf::nio::ByteBuffer::put (ByteBuffer & *src*) throw (**BufferOverflowException**, **ReadOnlyBufferException**, lang::exceptions::IllegalArgumentException)

This method transfers the bytes remaining in the given source buffer into this buffer. If there are more bytes remaining in the source buffer than in this buffer, that is, if src.remaining() >

remaining() (p. 632), then no bytes are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies $n = \text{src.remaining}()$ bytes from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n .

Parameters:

src - the buffer to take bytes from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer for the remaining bytes in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.119.3.40 `virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (std::size_t index, char value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]`

Writes one byte containing the given value, into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 710).

6.119.3.41 `virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (char value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 710).

6.119.3.42 `virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]`

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 710).

6.119.3.43 `virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (double value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 711).

6.119.3.44 `virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data
value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::ByteBuffer` (p. 711).

6.119.3.45 `virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (float value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::ByteBuffer` (p. 712).

6.119.3.46 `virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 712).

6.119.3.47 virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int *value*) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 713).

6.119.3.48 virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (std::size_t *index*, long long *value*) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 713).

6.119.3.49 `virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (long long value)
throw (BufferOverflowException, ReadOnlyBufferException) [pure
virtual]`

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::ByteBuffer` (p. 713).

6.119.3.50 `virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (std::size_t index,
short value) throw (lang::exceptions::IndexOutOfBoundsException,
ReadOnlyBufferException) [pure virtual]`

Writes two bytes containing the given value, into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the value to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::ByteBuffer` (p. 714).

6.119.3.51 `virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (short value)
throw (BufferOverflowException, ReadOnlyBufferException) [pure
virtual]`

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters:

value - The value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 714).

6.119.3.52 virtual ByteBuffer* decaf::nio::ByteBuffer::slice () const [pure virtual]

Creates a new byte buffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ByteBuffer** (p. 734) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 715).

6.119.3.53 virtual std::string decaf::nio::ByteBuffer::toString () const [virtual]**Returns:**

a std::string describing this object

6.119.3.54 static ByteBuffer* decaf::nio::ByteBuffer::wrap (std::vector< unsigned char > & buffer) [static]

Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 734). The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **ByteBuffer** (p. 734) that is backed by buffer, caller owns.

6.119.3.55 `static ByteBuffer* decaf::nio::ByteBuffer::wrap (unsigned
char * array, std::size_t offset, std::size_t length) throw (
lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new **ByteBuffer** (p. 734). The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

- array* - The array that will back the new buffer
- offset* - The offset of the subarray to be used
- length* - The length of the subarray to be used

Returns:

- a new **ByteBuffer** (p. 734) that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/ByteBuffer.h`

6.120 cms::BytesMessage Class Reference

A **BytesMessage** (p. 759) object is used to send a message containing a stream of unsigned bytes.

#include <src/main/cms/BytesMessage.h> Inheritance diagram for cms::BytesMessage:

Public Member Functions

- virtual **~BytesMessage** ()
- virtual void **setBodyBytes** (const unsigned char *buffer, std::size_t numBytes)=0 throw (CMSEException)
sets the bytes given to the message body.
- virtual const unsigned char * **getBodyBytes** () const =0 throw (CMSEException)
Gets the bytes that are contained in this message, user should copy this data into a user allocated buffer.
- virtual std::size_t **getBodyLength** () const =0 throw (CMSEException)
Returns the number of bytes contained in the body of this message.
- virtual void **reset** ()=0 throw (cms::CMSEException)
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () const =0 throw (cms::CMSEException)
Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value)=0 throw (cms::CMSEException)
Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () const =0 throw (cms::CMSEException)
Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value)=0 throw (cms::CMSEException)
Writes a byte to the bytes message stream as a 1-byte value.
- virtual std::size_t **readBytes** (std::vector< unsigned char > &value) const =0 throw (cms::CMSEException)
Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0 throw (cms::CMSEException)
Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual std::size_t **readBytes** (unsigned char *&buffer, std::size_t length) const =0 throw (cms::CMSEException)
Reads a portion of the bytes message stream.

- virtual void **writeBytes** (const unsigned char *value, std::size_t offset, std::size_t length)=0 throw (cms::CMSEException)
Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () const =0 throw (cms::CMSEException)
Reads a Char from the Bytes message stream.
- virtual void **writeChar** (char value)=0 throw (cms::CMSEException)
Writes a char to the bytes message stream as a 1-byte value.
- virtual float **readFloat** () const =0 throw (cms::CMSEException)
Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value)=0 throw (cms::CMSEException)
Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () const =0 throw (cms::CMSEException)
Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value)=0 throw (cms::CMSEException)
Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () const =0 throw (cms::CMSEException)
Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value)=0 throw (cms::CMSEException)
Writes a signed short to the bytes message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () const =0 throw (cms::CMSEException)
Reads a 16 bit unsigned short from the Bytes message stream.
- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (cms::CMSEException)
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () const =0 throw (cms::CMSEException)
Reads a 32 bit signed integer from the Bytes message stream.
- virtual void **writeInt** (int value)=0 throw (cms::CMSEException)
Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () const =0 throw (cms::CMSEException)
Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value)=0 throw (cms::CMSEException)
Writes a long long to the bytes message stream as a 8 byte value.
- virtual std::string **readString** () const =0 throw (cms::CMSEException)
Reads an ASCII String from the Bytes message stream.

- virtual void **writeString** (const std::string &value)=0 throw (cms::CMSEException)

Writes an ASCII String to the Bytes message stream.

- virtual std::string **readUTF** () const =0 throw (cms::CMSEException)

*Reads an UTF String from the **BytesMessage** (p. 759) stream.*

- virtual void **writeUTF** (const std::string &value)=0 throw (cms::CMSEException)

*Writes an UTF String to the **BytesMessage** (p. 759) stream.*

- virtual **BytesMessage** * **clone** () const =0

Clones this message.

6.120.1 Detailed Description

A **BytesMessage** (p. 759) object is used to send a message containing a stream of unsigned bytes. It inherits from the **Message** (p. 1753) interface and adds a bytes message body. The receiver of the message supplies the interpretation of the bytes using the methods added by the **BytesMessage** (p. 759) interface.

The **BytesMessage** (p. 759) methods are based largely on those found in **decaf.io.DataInputStream** (p. 1116) and **decaf.io.DataOutputStream** (p. 1125).

Although the CMS API allows the use of message properties with byte messages, they are typically not used, since the inclusion of properties may affect the format.

The primitive types can be written explicitly using methods for each type. Because the C++ language is more limited when dealing with primitive types the JMS equivalent generic read and write methods that take Java objects cannot be provided in the CMS API.

When the message is first created, and when **clearBody** is called, the body of the message is in write-only mode. After the first call to **reset** has been made, the message body is in read-only mode. After a message has been sent, the client that sent it can retain and modify it without affecting the message that has been sent. The same message object can be sent multiple times. When a message has been received, the provider has called **reset** so that the message body is in read-only mode for the client.

If **clearBody** is called on a message in read-only mode, the message body is cleared and the message is in write-only mode.

If a client attempts to read a message in write-only mode, a **MessageNotReadableException** (p. 1876) is thrown.

If a client attempts to write a message in read-only mode, a **MessageNotWriteableException** (p. 1877) is thrown.

Since:

1.0

6.120.2 Constructor & Destructor Documentation

6.120.2.1 `virtual cms::BytesMessage::~~BytesMessage () [inline, virtual]`

6.120.3 Member Function Documentation

6.120.3.1 `virtual BytesMessage* cms::BytesMessage::clone () const [pure virtual]`

Clones this message.

Returns:

a deep copy of this message.

Exceptions:

CMSEException (p. 850) - if an internal error occurs while cloning the **Message** (p. 1753).

Implements **cms::Message** (p. 1758).

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 166).

6.120.3.2 `virtual const unsigned char* cms::BytesMessage::getBodyBytes () const throw (CMSEException) [pure virtual]`

Gets the bytes that are contained in this message, user should copy this data into a user allocated buffer. Call `getBodyLength` to determine the number of bytes to expect.

Returns:

const pointer to a byte buffer

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

MessageNotReadableException (p. 1876) - If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 167).

6.120.3.3 `virtual std::size_t cms::BytesMessage::getBodyLength () const throw (CMSEException) [pure virtual]`

Returns the number of bytes contained in the body of this message.

Returns:

number of bytes.

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

MessageNotReadableException (p. 1876) - If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 167).

6.120.3.4 virtual bool cms::BytesMessage::readBoolean () const throw (cms::CMSEException) [pure virtual]

Reads a Boolean from the Bytes message stream.

Returns:

boolean value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 168).

6.120.3.5 virtual unsigned char cms::BytesMessage::readByte () const throw (cms::CMSEException) [pure virtual]

Reads a Byte from the Bytes message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 168).

6.120.3.6 virtual std::size_t cms::BytesMessage::readBytes (unsigned char *&buffer, std::size_t length) const throw (cms::CMSEException) [pure virtual]

Reads a portion of the bytes message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an `IndexOutOfBoundsException` is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to *value.length*

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 168).

6.120.3.7 `virtual std::size_t cms::BytesMessage::readBytes (std::vector< unsigned char > & value) const throw (cms::CMSEException) [pure virtual]`

Reads a byte array from the bytes message stream. If the length of vector *value* is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector *value*, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 169).

6.120.3.8 `virtual char cms::BytesMessage::readChar () const throw (cms::CMSEException) [pure virtual]`

Reads a Char from the Bytes message stream.

Returns:

char value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 169).

6.120.3.9 virtual double cms::BytesMessage::readDouble () const throw (cms::CMSEException) [pure virtual]

Reads a 64 bit double from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 170).

6.120.3.10 virtual float cms::BytesMessage::readFloat () const throw (cms::CMSEException) [pure virtual]

Reads a 32 bit float from the Bytes message stream.

Returns:

double value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 170).

6.120.3.11 virtual int cms::BytesMessage::readInt () const throw (cms::CMSEException) [pure virtual]

Reads a 32 bit signed integer from the Bytes message stream.

Returns:

int value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 170).

6.120.3.12 `virtual long long cms::BytesMessage::readLong () const throw (cms::CMSEException)` [pure virtual]

Reads a 64 bit long from the Bytes message stream.

Returns:

long long value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 171).

6.120.3.13 `virtual short cms::BytesMessage::readShort () const throw (cms::CMSEException)` [pure virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns:

short value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 171).

6.120.3.14 `virtual std::string cms::BytesMessage::readString () const throw (cms::CMSEException)` [pure virtual]

Reads an ASCII String from the Bytes message stream.

Returns:

String from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 171).

6.120.3.15 `virtual unsigned short cms::BytesMessage::readUnsignedShort () const throw (cms::CMSEException) [pure virtual]`

Reads a 16 bit unsigned short from the Bytes message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 171).

6.120.3.16 `virtual std::string cms::BytesMessage::readUTF () const throw (cms::CMSEException) [pure virtual]`

Reads an UTF String from the BytesMessage (p. 759) stream.

Returns:

String from stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 172).

6.120.3.17 `virtual void cms::BytesMessage::reset () throw (cms::CMSEException) [pure virtual]`

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions:

CMSEException (p. 850) - If the provider fails to perform the reset operation.

MessageFormatException (p. 1842) - If the *Message* (p. 1753) has an invalid format.

Implemented in *activemq::commands::ActiveMQBytesMessage* (p. 172).

6.120.3.18 `virtual void cms::BytesMessage::setBodyBytes (const unsigned char *
buffer, std::size_t numBytes) throw (CMSEException) [pure virtual]`

sets the bytes given to the message body.

Parameters:

buffer Byte Buffer to copy

numBytes Number of bytes in Buffer to copy

Exceptions:

CMSEException (p. 850) - If an internal error occurs.

MessageNotWriteableException (p. 1877) - if in Read Only Mode.

Implemented in *activemq::commands::ActiveMQBytesMessage* (p. 172).

6.120.3.19 `virtual void cms::BytesMessage::writeBoolean (bool value) throw (
cms::CMSEException) [pure virtual]`

Writes a boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value boolean to write to the stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in *activemq::commands::ActiveMQBytesMessage* (p. 173).

6.120.3.20 `virtual void cms::BytesMessage::writeByte (unsigned char value) throw (
cms::CMSEException) [pure virtual]`

Writes a byte to the bytes message stream as a 1-byte value.

Parameters:

value byte to write to the stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in *activemq::commands::ActiveMQBytesMessage* (p. 173).

6.120.3.21 `virtual void cms::BytesMessage::writeBytes (const unsigned char * value, std::size_t offset, std::size_t length) throw (cms::CMSEException)` [pure virtual]

Writes a portion of a byte array to the bytes message stream. size as the number of bytes to write.

Parameters:

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 173).

6.120.3.22 `virtual void cms::BytesMessage::writeBytes (const std::vector< unsigned char > & value) throw (cms::CMSEException)` [pure virtual]

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters:

value bytes to write to the stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 174).

6.120.3.23 `virtual void cms::BytesMessage::writeChar (char value) throw (cms::CMSEException)` [pure virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters:

value char to write to the stream

Exceptions:

CMSEException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 174).

6.120.3.24 `virtual void cms::BytesMessage::writeDouble (double value) throw (cms::CMSException)` [pure virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters:

value double to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 174).

6.120.3.25 `virtual void cms::BytesMessage::writeFloat (float value) throw (cms::CMSException)` [pure virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters:

value float to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 175).

6.120.3.26 `virtual void cms::BytesMessage::writeInt (int value) throw (cms::CMSException)` [pure virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters:

value signed int to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 175).

6.120.3.27 virtual void cms::BytesMessage::writeLong (long long *value*) throw (cms::CMSException) [pure virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters:

value signed long long to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 175).

6.120.3.28 virtual void cms::BytesMessage::writeShort (short *value*) throw (cms::CMSException) [pure virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters:

value signed short to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 175).

6.120.3.29 virtual void cms::BytesMessage::writeString (const std::string & *value*) throw (cms::CMSException) [pure virtual]

Writes an ASCII String to the Bytes message stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 176).

6.120.3.30 `virtual void cms::BytesMessage::writeUnsignedShort (unsigned short value) throw (cms::CMSException)` [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value unsigned short to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 1877) - if the message is in read-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 176).

6.120.3.31 `virtual void cms::BytesMessage::writeUTF (const std::string & value) throw (cms::CMSException)` [pure virtual]

Writes an UTF String to the `BytesMessage` (p. 759) stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException (p. 850) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 1841) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 1876) - if the message is in write-only mode.

Implemented in `activemq::commands::ActiveMQBytesMessage` (p. 176).

The documentation for this class was generated from the following file:

6.121 activemq::cmsutil::CachedConsumer Class Reference

A cached message consumer contained within a pooled session.

#include <src/main/activemq/cmsutil/CachedConsumer.h> Inheritance diagram for activemq::cmsutil::CachedConsumer:

Public Member Functions

- **CachedConsumer** (cms::MessageConsumer *consumer)
- virtual ~**CachedConsumer** ()
- virtual void **close** () throw (cms::CMSEException)
Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual cms::Message * **receive** () throw (cms::CMSEException)
Synchronously Receive a Message.
- virtual cms::Message * **receive** (int millisecs) throw (cms::CMSEException)
Synchronously Receive a Message, time out after defined interval.
- virtual cms::Message * **receiveNoWait** () throw (cms::CMSEException)
Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.
- virtual void **setMessageListener** (cms::MessageListener *listener) throw (cms::CMSEException)
Sets the MessageListener that this class will send notifs on.
- virtual cms::MessageListener * **getMessageListener** () const throw (cms::CMSEException)
Gets the MessageListener that this class will send new Message notification events to.
- virtual std::string **getMessageSelector** () const throw (cms::CMSEException)
Gets this message consumer's message selector expression.

6.121.1 Detailed Description

A cached message consumer contained within a pooled session.

6.121.2 Constructor & Destructor Documentation

6.121.2.1 `activemq::cmsutil::CachedConsumer::CachedConsumer (cms::MessageConsumer * consumer)` [inline]

6.121.2.2 `virtual activemq::cmsutil::CachedConsumer::~~CachedConsumer ()` [inline, virtual]

6.121.3 Member Function Documentation

6.121.3.1 `virtual void activemq::cmsutil::CachedConsumer::close () throw (cms::CMSEException)` [inline, virtual]

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements `cms::Closeable` (p. 838).

6.121.3.2 `virtual cms::MessageListener* activemq::cmsutil::CachedConsumer::getMessageListener () const throw (cms::CMSEException)` [inline, virtual]

Gets the MessageListener that this class will send new Message notification events to.

Returns:

The listener of messages received by this consumer

Exceptions:

CMSEException - If an internal error occurs.

Implements `cms::MessageConsumer` (p. 1796).

6.121.3.3 `virtual std::string activemq::cmsutil::CachedConsumer::getMessageSelector () const throw (cms::CMSEException)` [inline, virtual]

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

CMSEException - If an internal error occurs.

Implements `cms::MessageConsumer` (p. 1796).

6.121.3.4 `virtual cms::Message* activemq::cmsutil::CachedConsumer::receive (int milliseconds) throw (cms::CMSEException)` [inline, virtual]

Synchronously Receive a Message, time out after defined interval. Returns null if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1796).

6.121.3.5 `virtual cms::Message* activemq::cmsutil::CachedConsumer::receive ()
throw (cms::CMSEException) [inline, virtual]`

Synchronously Receive a Message.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1797).

6.121.3.6 `virtual cms::Message* ac-
tivemq::cmsutil::CachedConsumer::receiveNoWait ()
throw (cms::CMSEException) [inline, virtual]`

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1797).

6.121.3.7 `virtual void activemq::cmsutil::CachedConsumer::setMessageListener
(cms::MessageListener * listener) throw (cms::CMSEException)
[inline, virtual]`

Sets the MessageListener that this class will send notifs on.

Parameters:

listener The listener of messages received by this consumer.

Exceptions:

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1797).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CachedConsumer.h`

6.122 activemq::cmsutil::CachedProducer Class Reference

A cached message producer contained within a pooled session.

#include <src/main/activemq/cmsutil/CachedProducer.h> Inheritance diagram for activemq::cmsutil::CachedProducer:

Public Member Functions

- **CachedProducer** (**cms::MessageProducer** *producer)
- virtual **~CachedProducer** ()
- virtual void **close** () throw (cms::CMSEException)
Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual void **send** (**cms::Message** *message) throw (cms::CMSEException)
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message) throw (cms::CMSEException)
Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **setDeliveryMode** (int mode) throw (cms::CMSEException)
Sets the delivery mode for this Producer.
- virtual int **getDeliveryMode** () const throw (cms::CMSEException)
Gets the delivery mode for this Producer.
- virtual void **setDisableMessageID** (bool value) throw (cms::CMSEException)
Sets if Message Ids are disabled for this Producer.
- virtual bool **getDisableMessageID** () const throw (cms::CMSEException)
Gets if Message Ids are disabled for this Producer.
- virtual void **setDisableMessageTimeStamp** (bool value) throw (cms::CMSEException)
Sets if Message Time Stamps are disabled for this Producer.
- virtual bool **getDisableMessageTimeStamp** () const throw (cms::CMSEException)

Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority) throw (cms::CMSEException)
Sets the Priority that this Producers sends messages at.
- virtual int **getPriority** () const throw (cms::CMSEException)
Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time) throw (cms::CMSEException)
Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () const throw (cms::CMSEException)
Gets the Time to Live that this producer sends messages with.

6.122.1 Detailed Description

A cached message producer contained within a pooled session.

6.122.2 Constructor & Destructor Documentation

6.122.2.1 `activemq::cmsutil::CachedProducer::CachedProducer (cms::MessageProducer * producer) [inline]`

6.122.2.2 `virtual activemq::cmsutil::CachedProducer::~~CachedProducer () [inline, virtual]`

6.122.3 Member Function Documentation

6.122.3.1 `virtual void activemq::cmsutil::CachedProducer::close () throw (cms::CMSEException) [inline, virtual]`

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements `cms::Closeable` (p. 838).

6.122.3.2 `virtual int activemq::cmsutil::CachedProducer::getDeliveryMode () const throw (cms::CMSEException) [inline, virtual]`

Gets the delivery mode for this Producer.

Returns:

The DeliveryMode

Exceptions:

CMSEException - if an internal error occurs.

Implements `cms::MessageProducer` (p. 1879).

6.122.3.3 virtual bool activemq::cmsutil::CachedProducer::getDisableMessageID () const throw (cms::CMSEException) [inline, virtual]

Gets if Message Ids are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p.1880).

6.122.3.4 virtual bool activemq::cmsutil::CachedProducer::getDisableMessageTimeStamp () const throw (cms::CMSEException) [inline, virtual]

Gets if Message Time Stamps are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p.1880).

6.122.3.5 virtual int activemq::cmsutil::CachedProducer::getPriority () const throw (cms::CMSEException) [inline, virtual]

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p.1880).

6.122.3.6 virtual long long activemq::cmsutil::CachedProducer::getTimeToLive () const throw (cms::CMSEException) [inline, virtual]

Gets the Time to Live that this producer sends messages with.

Returns:

Time to live value in milliseconds

Exceptions:

CMSEException - if an internal error occurs.

Implements `cms::MessageProducer` (p.1880).

6.122.3.7 `virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * destination, cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)` [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSEException - if an internal error occurs.

Implements `cms::MessageProducer` (p.1881).

6.122.3.8 `virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * destination, cms::Message * message) throw (cms::CMSEException)` [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

destination The destination on which to send the message

message the message to be sent.

Exceptions:

CMSEException - if an internal error occurs.

Implements `cms::MessageProducer` (p.1881).

6.122.3.9 `virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)` [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message The message to be sent.
deliveryMode The delivery mode to be used.
priority The priority for this message.
timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 1882).

6.122.3.10 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message) throw (cms::CMSEException) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

message The message to be sent.

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 1882).

6.122.3.11 virtual void activemq::cmsutil::CachedProducer::setDeliveryMode (int mode) throw (cms::CMSEException) [inline, virtual]

Sets the delivery mode for this Producer.

Parameters:

mode The DeliveryMode

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 1882).

6.122.3.12 virtual void activemq::cmsutil::CachedProducer::setDisableMessageID (bool value) throw (cms::CMSEException) [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters:

value boolean indicating enable / disable (true / false)

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p.1883).

6.122.3.13 `virtual void activemq::cmsutil::CachedProducer::setDisableMessageTimeStamp (bool value) throw (cms::CMSEException) [inline, virtual]`

Sets if Message Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p.1883).

6.122.3.14 `virtual void activemq::cmsutil::CachedProducer::setPriority (int priority) throw (cms::CMSEException) [inline, virtual]`

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p.1883).

6.122.3.15 `virtual void activemq::cmsutil::CachedProducer::setTimeToLive (long long time) throw (cms::CMSEException) [inline, virtual]`

Sets the Time to Live that this Producers sends messages with. This value will be used if the time to live is not specified via the send method.

Parameters:

time default time to live value in milliseconds

Exceptions:

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p.1883).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CachedProducer.h**

6.123 decaf::util::concurrent::Callable< V > Class Template Reference

```
#include <src/main/decaf/util/concurrent/Callable.h>
```

Public Member Functions

- virtual `~Callable ()`
- virtual `V call ()=0 throw (decaf::lang::Exception)`
Computes a result, or throws an exception if unable to do so.

```
template<typename V> class decaf::util::concurrent::Callable< V >
```

6.123.1 Constructor & Destructor Documentation

6.123.1.1 `template<typename V > virtual decaf::util::concurrent::Callable< V >::~~Callable () [inline, virtual]`

6.123.2 Member Function Documentation

6.123.2.1 `template<typename V > virtual V decaf::util::concurrent::Callable< V >::call () throw (decaf::lang::Exception) [pure virtual]`

Computes a result, or throws an exception if unable to do so.

Returns:

Computed Result.

Exceptions:

Exception If unable to compute a result.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Callable.h`

6.124 decaf::util::concurrent::CancellationException Class Reference

#include <src/main/decaf/util/concurrent/CancellationException.h> Inheritance diagram for decaf::util::concurrent::CancellationException:

Public Member Functions

- **CancellationException** () throw ()
Default Constructor.
- **CancellationException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **CancellationException** (const **CancellationException** &ex) throw ()
Copy Constructor.
- **CancellationException** (const std::exception *cause) throw ()
Constructor.
- **CancellationException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **CancellationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **CancellationException** * clone () const
Clones this exception.
- virtual ~**CancellationException** () throw ()

6.124.1 Constructor & Destructor Documentation

6.124.1.1 decaf::util::concurrent::CancellationException::CancellationException () throw () [inline]

Default Constructor.

6.124.1.2 decaf::util::concurrent::CancellationException::CancellationException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.124.1.3 `decaf::util::concurrent::CancellationException::CancellationException` (const CancellationException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

References `decaf::lang::Exception::Exception()`.

6.124.1.4 `decaf::util::concurrent::CancellationException::CancellationException` (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.124.1.5 `decaf::util::concurrent::CancellationException::CancellationException` (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - list of primitives that are formatted into the message

6.124.1.6 `decaf::util::concurrent::CancellationException::CancellationException` (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.124.1.7 **virtual**
decaf::util::concurrent::CancellationException::~~CancellationException ()
throw () [inline, virtual]

6.124.2 Member Function Documentation

6.124.2.1 **virtual CancellationException* de-**
caf::util::concurrent::CancellationException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/CancellationException.h`

6.125 decaf::security::cert::Certificate Class Reference

Base interface for all identity certificates.

#include <src/main/decaf/security/cert/Certificate.h> Inheritance diagram for decaf::security::cert::Certificate:

Public Member Functions

- virtual **~Certificate** ()
- virtual bool **equals** (const **Certificate** &cert) const =0
Compares the encoded form of the two certificates.
- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0 throw (CertificateEncodingException)
Provides the encoded form of this certificate.
- virtual std::string **getType** () const =0
Returns the type of this certificate.
- virtual **PublicKey** * **getPublicKey** ()=0
Gets the public key of this certificate.
- virtual const **PublicKey** * **getPublicKey** () const =0
Gets the public key of this certificate.
- virtual void **verify** (const **PublicKey** &publicKey) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual void **verify** (const **PublicKey** &publicKey, const std::string &sigProvider) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual std::string **toString** () const =0
Returns a string representation of this certificate.

6.125.1 Detailed Description

Base interface for all identity certificates.

6.125.2 Constructor & Destructor Documentation

6.125.2.1 `virtual decaf::security::cert::Certificate::~~Certificate () [inline, virtual]`

6.125.3 Member Function Documentation

6.125.3.1 `virtual bool decaf::security::cert::Certificate::equals (const Certificate & cert) const [pure virtual]`

Compares the encoded form of the two certificates.

Parameters:

cert (p. 110) The certificate to be tested for equality with this certificate.

Returns:

true if the given certificate is equal to this certificate.

6.125.3.2 `virtual void decaf::security::cert::Certificate::getEncoded (std::vector< unsigned char > & output) const throw (CertificateEncodingException) [pure virtual]`

Provides the encoded form of this certificate.

Parameters:

output Receives the encoded form of this certificate.

Exceptions:

CertificateEncodingException (p. 791) if an encoding error occurs

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 1966).

6.125.3.3 `virtual const PublicKey* decaf::security::cert::Certificate::getPublicKey () const [pure virtual]`

Gets the public key of this certificate.

Returns:

the public key

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 1967).

6.125.3.4 `virtual PublicKey* decaf::security::cert::Certificate::getPublicKey () [pure virtual]`

Gets the public key of this certificate.

Returns:

the public key

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 1967).

6.125.3.5 `virtual std::string decaf::security::cert::Certificate::getType () const`
[pure virtual]

Returns the type of this certificate.

Returns:

the type of this certificate

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 1968).

6.125.3.6 `virtual std::string decaf::security::cert::Certificate::toString () const`
[pure virtual]

Returns a string representation of this certificate.

Returns:

a string representation of this certificate

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 1968).

6.125.3.7 `virtual void decaf::security::cert::Certificate::verify (const
PublicKey & publicKey, const std::string & sigProvider) const
throw (NoSuchAlgorithmException, InvalidKeyException,
NoSuchProviderException, SignatureException, CertificateException)`
[pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key. Uses the verification engine of the specified provider.

Parameters:

publicKey The public key used to carry out the validation.

sigProvider The name of the signature provider

Exceptions:

NoSuchAlgorithmException (p. 1942) - on unsupported signature algorithms.

InvalidKeyException (p. 1467) - on incorrect key.

NoSuchProviderException (p. 1948) - if there's no default provider.

SignatureException (p. 2364) - on signature errors.

CertificateException (p. 793) - on encoding errors.

6.125.3.8 `virtual void decaf::security::cert::Certificate::verify (const PublicKey & publicKey) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]`

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters:

publicKey The public key used to carry out the validation.

Exceptions:

NoSuchAlgorithmException (p. 1942) - on unsupported signature algorithms.

InvalidKeyException (p. 1467) - on incorrect key.

NoSuchProviderException (p. 1948) - if there's no default provider.

SignatureException (p. 2364) - on signature errors.

CertificateException (p. 793) - on encoding errors.

The documentation for this class was generated from the following file:

- `src/main/decaf/security/cert/Certificate.h`

6.126 decaf::security::cert::CertificateEncodingException Class Reference

#include <src/main/decaf/security/cert/CertificateEncodingException.h> Inheritance diagram for decaf::security::cert::CertificateEncodingException:

Public Member Functions

- **CertificateEncodingException** () throw ()
Default Constructor.

Clones this exception.
- virtual ~**CertificateEncodingException** () throw ()

6.126.1 Constructor & Destructor Documentation

6.126.1.1 decaf::security::cert::CertificateEncodingException::CertificateEncodingException () throw () [inline]

Default Constructor.

6.126.1.2 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.126.1.3 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const CertificateEncodingException & ex) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.126.1.4 `decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.126.1.5 `virtual decaf::security::cert::CertificateEncodingException::~~CertificateEncodingException () throw () [inline, virtual]`

6.126.2 Member Function Documentation

6.126.2.1 `virtual CertificateEncodingException* decaf::security::cert::CertificateEncodingException::clone () const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p. 794).

6.130.1 Constructor & Destructor Documentation

6.130.1.1 decaf::security::cert::CertificateParsingException::CertificateParsingException () throw () [inline]

Default Constructor.

6.130.1.2 decaf::security::cert::CertificateParsingException::CertificateParsingException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.130.1.3 decaf::security::cert::CertificateParsingException::CertificateParsingException (const CertificateParsingException & ex) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.130.1.4 `decaf::security::cert::CertificateParsingException::CertificateParsingException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.130.1.5 `virtual decaf::security::cert::CertificateParsingException::~~CertificateParsingException () throw () [inline, virtual]`

6.130.2 Member Function Documentation

6.130.2.1 `virtual CertificateParsingException* decaf::security::cert::CertificateParsingException::clone () const [inline, virtual]`

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p. 794).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/cert/CertificateParsingException.h`

6.131 decaf::lang::Character Class Reference

#include <src/main/decaf/lang/Character.h> Inheritance diagram for decaf::lang::Character:

Public Member Functions

- **Character** (char value)
- virtual int **compareTo** (const **Character** &c) const
*Compares this **Character** (p. 801) instance with another.*
- virtual bool **operator==** (const **Character** &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Character** &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const char &c) const
*Compares this **Character** (p. 801) instance with a char type.*
- virtual bool **operator==** (const char &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const char &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- bool **equals** (const **Character** &c) const
- bool **equals** (const char &c) const
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static **Character valueOf** (char value)
*Returns a **Character** (p. 801) instance representing the specified char value.*
- static bool **isWhitespace** (char c)
Indicates whether or not the given character is considered whitespace.
- static bool **isDigit** (char c)
Indicates whether or not the given character is a digit.
- static bool **isLowerCase** (char c)
Indicates whether or not the given character is a lower case character.
- static bool **isUpperCase** (char c)
Indicates whether or not the given character is a upper case character.
- static bool **isLetter** (char c)
Indicates whether or not the given character is a letter.
- static bool **isLetterOrDigit** (char c)
Indicates whether or not the given character is either a letter or a digit.
- static bool **isISOControl** (char c)
Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.
- static int **digit** (char c, int radix)
Returns the numeric value of the character ch in the specified radix.

Static Public Attributes

- static const int **MIN_RADIX** = 2
The minimum radix available for conversion to and from strings.
- static const int **MAX_RADIX** = 36
The maximum radix available for conversion to and from strings.
- static const char **MIN_VALUE** = (char)0x7F
The minimum value that a signed char can take on.
- static const char **MAX_VALUE** = (char)0x80
The maximum value that a signed char can take on.
- static const int **SIZE** = 8
The size of the primitive charactor in bits.

6.131.1 Constructor & Destructor Documentation

6.131.1.1 decaf::lang::Character::Character (char *value*)

Parameters:

value - char to wrap.

6.131.2 Member Function Documentation

6.131.2.1 virtual unsigned char decaf::lang::Character::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1954).

6.131.2.2 virtual int decaf::lang::Character::compareTo (const char & *c*) const [inline, virtual]

Compares this **Character** (p. 801) instance with a char type.

Parameters:

c - the char instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< char >** (p. 899).

6.131.2.3 virtual int decaf::lang::Character::compareTo (const Character & *c*) const [inline, virtual]

Compares this **Character** (p. 801) instance with another.

Parameters:

c - the **Character** (p. 801) instance to be compared

Returns:

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.131.2.4 static int decaf::lang::Character::digit (char *c*, int *radix*) [static]

Returns the numeric value of the character *ch* in the specified radix. If the radix is not in the range `MIN_RADIX <= radix <= MAX_RADIX` or if the value of *ch* is not a valid digit in the specified radix, -1 is returned. A character is a valid digit if at least one of the following is true:

* The method `isDigit` is true of the character and the single-character decomposition is less than the specified radix. In this case the decimal digit value is returned. * The character is one of the uppercase Latin letters 'A' through 'Z' and its code is less than `radix + 'A' - 10`. In this case, `ch - 'A' + 10` is returned. * The character is one of the lowercase Latin letters 'a' through 'z' and its code is less than `radix + 'a' - 10`. In this case, `ch - 'a' + 10` is returned.

Parameters:

c - the char to be converted
radix - the radix of the number

Returns:

the numeric value of the number represented in the given radix

6.131.2.5 virtual double decaf::lang::Character::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.131.2.6 bool decaf::lang::Character::equals (const char & *c*) const [inline, virtual]**Returns:**

true if the two Characters have the same value.

Implements **decaf::lang::Comparable< char >** (p.900).

6.131.2.7 bool decaf::lang::Character::equals (const Character & *c*) const [inline]**Returns:**

true if the two **Character** (p.801) Objects have the same value.

6.131.2.8 virtual float decaf::lang::Character::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.131.2.9 `virtual int decaf::lang::Character::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p.1955).

6.131.2.10 `static bool decaf::lang::Character::isDigit (char c) [inline, static]`

Indicates whether or not the given character is a digit.

6.131.2.11 `static bool decaf::lang::Character::isISOControl (char c) [inline, static]`

Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

Parameters:

c - the character, including supplementary characters

Returns:

true if the char is an ISO control character

6.131.2.12 `static bool decaf::lang::Character::isLetter (char c) [inline, static]`

Indicates whether or not the given character is a letter.

6.131.2.13 `static bool decaf::lang::Character::isLetterOrDigit (char c) [inline, static]`

Indicates whether or not the given character is either a letter or a digit.

6.131.2.14 `static bool decaf::lang::Character::isLowerCase (char c) [inline, static]`

Indicates whether or not the given character is a lower case character.

6.131.2.15 `static bool decaf::lang::Character::isUpperCase (char c) [inline, static]`

Indicates whether or not the given character is a upper case character.

6.131.2.16 `static bool decaf::lang::Character::isWhitespace (char c) [inline, static]`

Indicates whether or not the given character is considered whitespace.

6.131.2.17 `virtual long long decaf::lang::Character::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1955).

6.131.2.18 `virtual bool decaf::lang::Character::operator< (const char & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< char >** (p. 900).

6.131.2.19 `virtual bool decaf::lang::Character::operator< (const Character & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.131.2.20 `virtual bool decaf::lang::Character::operator== (const char & c) const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< char >** (p. 901).

6.131.2.21 `virtual bool decaf::lang::Character::operator==(const Character & c)
const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters:

c - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.131.2.22 `virtual short decaf::lang::Character::shortValue () const [inline,
virtual]`

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p.1956).

6.131.2.23 `std::string decaf::lang::Character::toString () const`

Returns:

this **Character** (p. 801) Object as a String Representation

6.131.2.24 `static Character decaf::lang::Character::valueOf (char value) [inline,
static]`

Returns a **Character** (p. 801) instance representing the specified char value.

Parameters:

value - the primitive char to wrap.

Returns:

a new Character instance that wraps this value.

6.131.3 Field Documentation

6.131.3.1 `const int decaf::lang::Character::MAX_RADIX = 36 [static]`

The maximum radix available for conversion to and from strings.

6.131.3.2 `const char decaf::lang::Character::MAX_VALUE = (char)0x80 [static]`

The maximum value that a signed char can take on.

6.131.3.3 `const int decaf::lang::Character::MIN_RADIX = 2` [static]

The minimum radix available for conversion to and from strings.

6.131.3.4 `const char decaf::lang::Character::MIN_VALUE = (char)0x7F` [static]

The minimum value that a signed char can take on.

6.131.3.5 `const int decaf::lang::Character::SIZE = 8` [static]

The size of the primitive character in bits.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Character.h`

6.132 decaf::internal::nio::CharArrayBuffer Class Reference

#include <src/main/decaf/internal/nio/CharArrayBuffer.h> Inheritance diagram for decaf::internal::nio::CharArrayBuffer:

Public Member Functions

- **CharArrayBuffer** (std::size_t capacity, bool **readOnly**=false)

*Creates a **CharArrayBuffer** (p. 809) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **CharArrayBuffer** (char *array, std::size_t **offset**, std::size_t capacity, bool **readOnly**=false) throw (decaf::lang::exceptions::NullPointerException)

*Creates a **CharArrayBuffer** (p. 809) object that wraps the given array.*
- **CharArrayBuffer** (ByteArrayPerspective &array, std::size_t **offset**, std::size_t length, bool **readOnly**=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset.*
- **CharArrayBuffer** (const **CharArrayBuffer** &other)

*Create a **CharArrayBuffer** (p. 809) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.*
- virtual ~**CharArrayBuffer** ()
- virtual char * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the character array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual CharBuffer * **asReadOnlyBuffer** () const

Creates a new, read-only char buffer that shares this buffer's content.
- virtual CharBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

Compacts this buffer.
- virtual CharBuffer * **duplicate** ()

Creates a new char buffer that shares this buffer's content.
- virtual char **get** () throw (decaf::nio::BufferUnderflowException)

Relative get method.
- virtual char **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual bool **hasArray** () const
Tells whether or not this buffer is backed by an accessible char array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual CharBuffer & **put** (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given char into this buffer at the current position, and then increments the position.
- virtual CharBuffer & **put** (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given char into this buffer at the given index.
- virtual CharBuffer * **slice** () const
Creates a new CharBuffer whose content is a shared subsequence of this buffer's content.
- virtual **lang::CharSequence** * **subSequence** (std::size_t start, std::size_t end) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **ByteArrayBuffer** (p. 694) as Read-Only.*

Protected Attributes

- bool **readOnly**
- **internal::nio::ByteArrayPerspective** * **_array**
- std::size_t **offset**

6.132.1 Constructor & Destructor Documentation

6.132.1.1 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (std::size_t *capacity*, bool *readOnly* = false)

Creates a **CharArrayBuffer** (p. 809) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

- capacity*** - size of the array, this is the limit we read and write to.
- readOnly*** - should this buffer be read-only, default as false

6.132.1.2 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (char * *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **CharArrayBuffer** (p. 809) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.132.1.3 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (ByteArrayPerspective & *array*, std::size_t *offset*, std::size_t *length*, bool *readOnly* = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 729) and start at the given offset. The capacity and limit of the new **CharArrayBuffer** (p. 809) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 729) to wrap

offset - the offset into array where the buffer starts

length - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.132.1.4 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const CharArrayBuffer & *other*)

Create a **CharArrayBuffer** (p. 809) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 729) and when changes are made to that data it is reflected in both.

Parameters:

other - the **CharArrayBuffer** (p. 809) this one is to mirror.

6.132.1.5 `virtual decaf::internal::nio::CharArrayBuffer::~~CharArrayBuffer ()`
[virtual]

6.132.2 Member Function Documentation

6.132.2.1 `virtual char* decaf::internal::nio::CharArrayBuffer::array ()`
`throw (decaf::lang::exceptions::UnsupportedOperationException,`
`decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the character array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::CharBuffer` (p. 822).

6.132.2.2 `virtual std::size_t decaf::internal::nio::CharArrayBuffer::arrayOffset`
`() throw (decaf::lang::exceptions::UnsupportedOperationException,`
`decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::CharBuffer` (p. 822).

6.132.2.3 `virtual CharBuffer* de-`
`caf::internal::nio::CharArrayBuffer::asReadOnlyBuffer ()`
`const` [virtual]

Creates a new, read-only char buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only char buffer which the caller then owns.

Implements **decaf::nio::CharBuffer** (p. 822).

**6.132.2.4 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::compact ()
throw (decaf::nio::ReadOnlyBufferException) [virtual]**

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 631) - 1 is copied to index $n = \text{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this CharBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 823).

**6.132.2.5 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::duplicate ()
[virtual]**

Creates a new char buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new char Buffer which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 824).

**6.132.2.6 virtual char decaf::internal::nio::CharArrayBuffer::get (std::size_t index)
const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]**

Absolute get method. Reads the char at the given index.

Parameters:

index - the index in the Buffer where the char is to be read

Returns:

the char that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::CharBuffer** (p. 825).

6.132.2.7 `virtual char decaf::internal::nio::CharArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]`

Relative get method. Reads the character at this buffer's current position, and then increments the position.

Returns:

the char at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::CharBuffer** (p. 825).

6.132.2.8 `virtual bool decaf::internal::nio::CharArrayBuffer::hasArray () const [inline, virtual]`

Tells whether or not this buffer is backed by an accessible char array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::CharBuffer** (p. 826).

6.132.2.9 `virtual bool decaf::internal::nio::CharArrayBuffer::isReadOnly () const [inline, virtual]`

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 630).

6.132.2.10 `virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given char into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data
value - the char to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 828).

6.132.2.11 `virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given char into this buffer at the current position, and then increments the position.

Parameters:

value - the char value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 828).

6.132.2.12 `virtual void decaf::internal::nio::CharArrayBuffer::setReadOnly (bool value) [inline, protected, virtual]`

Sets this **ByteBuffer** (p. 694) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.132.2.13 `virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::slice () const [virtual]`

Creates a new CharBuffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create CharBuffer which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 830).

6.132.2.14 **virtual lang::CharSequence* decaf::internal::nio::CharArrayBuffer::subSequence (std::size_t start, std::size_t end) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)** [virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position. The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 631) + start, and its limit will be **position()** (p. 631) + end. The new Buffer will be read-only if, and only if, this buffer is read-only.

Parameters:

- start** - The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 632)
- end** - The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 632)

Returns:

The new character buffer, caller owns

Exceptions:

IndexOutOfBoundsException - If the preconditions on start and end fail

Implements **decaf::nio::CharBuffer** (p. 831).

6.132.3 Field Documentation

6.132.3.1 **internal::nio::ByteArrayPerspective* decaf::internal::nio::CharArrayBuffer::_array** [protected]

6.132.3.2 **std::size_t decaf::internal::nio::CharArrayBuffer::offset** [protected]

6.132.3.3 **bool decaf::internal::nio::CharArrayBuffer::readOnly** [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/CharArrayBuffer.h

6.133 decaf::nio::CharBuffer Class Reference

This class defines four categories of operations upon character buffers:.

```
#include <src/main/decaf/nio/CharBuffer.h>
Inheritance diagram for decaf::nio::CharBuffer:
```

Public Member Functions

- virtual **~CharBuffer** ()
- virtual std::string **toString** () const
- **CharBuffer** & **append** (char value) throw (BufferOverflowException, ReadOnlyBufferException)
Appends the specified character to this buffer.
- **CharBuffer** & **append** (const lang::CharSequence *value) throw (BufferOverflowException, ReadOnlyBufferException)
Appends the specified character sequence to this buffer.
- **CharBuffer** & **append** (const lang::CharSequence *value, std::size_t start, std::size_t end) throw (decaf::lang::exceptions::IndexOutOfBoundsException, BufferOverflowException, ReadOnlyBufferException)
Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.
- virtual char * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the character array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **CharBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only char buffer that shares this buffer's content.
- char **charAt** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Reads the character at the given index relative to the current position.
- virtual **CharBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **CharBuffer** * **duplicate** ()=0
Creates a new char buffer that shares this buffer's content.
- virtual char **get** ()=0 throw (BufferUnderflowException)
Relative get method.

- virtual char **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **CharBuffer** & **get** (std::vector< char > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **CharBuffer** & **get** (char *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible char array.
- std::size_t **length** () const
Returns the length of this character buffer.
- **CharBuffer** & **put** (**CharBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the chars remaining in the given source buffer into this buffer.
- **CharBuffer** & **put** (const char *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers chars into this buffer from the given source array.
- **CharBuffer** & **put** (std::vector< char > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source char array into this buffer.
- virtual **CharBuffer** & **put** (char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given char into this buffer at the current position, and then increments the position.
- virtual **CharBuffer** & **put** (std::size_t index, char value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given char into this buffer at the given index.
- **CharBuffer** & **put** (const std::string &src, std::size_t start, std::size_t end) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException)
Relative bulk put method (optional operation).
- **CharBuffer** & **put** (const std::string &src) throw (BufferOverflowException, ReadOnlyBufferException)
Relative bulk put method (optional operation).
- virtual std::size_t **read** (**CharBuffer** *target) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, ReadOnlyBufferException)
Attempts to read characters into the specified character buffer.

- virtual **lang::CharSequence** * **subSequence** (std::size_t start, std::size_t end) const =0
throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.
- virtual **CharBuffer** * **slice** () const =0
*Creates a new **CharBuffer** (p. 817) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **CharBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **CharBuffer** &value) const
- virtual bool **operator==** (const **CharBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **CharBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **CharBuffer** * **allocate** (std::size_t capacity)
Allocates a new character buffer.
- static **CharBuffer** * **wrap** (char *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **CharBuffer** (p. 817).*
- static **CharBuffer** * **wrap** (std::vector< char > &buffer)
*Wraps the passed STL char Vector in a **CharBuffer** (p. 817).*

Protected Member Functions

- **CharBuffer** (std::size_t capacity)
*Creates a **CharBuffer** (p. 817) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.133.1 Detailed Description

This class defines four categories of operations upon character buffers:

- o Absolute and relative get and put methods that read and write single characters;
- o Relative bulk get methods that transfer contiguous sequences of characters from this buffer into an array; and
- o Relative bulk put methods that transfer contiguous sequences of characters from a character array, a string, or some other character buffer into this buffer.
- o Methods for compacting, duplicating, and slicing a character buffer.

Character buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing character array or string into a buffer, or by creating a view of an existing byte buffer

This class implements the `CharSequence` interface so that character buffers may be used wherever character sequences are accepted, for example in the regular-expression package `decaf.util.regex`.

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained. The sequence of statements

```
cb.put("text/"); cb.put(subtype); cb.put("; charset="); cb.put(enc);
```

can, for example, be replaced by the single statement

```
cb.put("text/").put(subtype).put("; charset=").put(enc);
```

6.133.2 Constructor & Destructor Documentation

6.133.2.1 `decaf::nio::CharBuffer::CharBuffer (std::size_t capacity)` [protected]

Creates a **CharBuffer** (p. 817) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

6.133.2.2 `virtual decaf::nio::CharBuffer::~~CharBuffer ()` [inline, virtual]

6.133.3 Member Function Documentation

6.133.3.1 `static CharBuffer* decaf::nio::CharBuffer::allocate (std::size_t capacity)` [static]

Allocates a new character buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Char buffer in chars (1 byte).

Returns:

the **CharBuffer** (p. 817) that was allocated, caller owns.

6.133.3.2 `CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * value, std::size_t start, std::size_t end) throw (decaf::lang::exceptions::IndexOutOfBoundsException, BufferOverflowException, ReadOnlyBufferException)` [virtual]

Appends a subsequence of the specified character sequence to this buffer. If *value* is `Null` the the string "null" is appended to the buffer.

Parameters:

value - the CharSequence to append.
start - the index to start appending from.
end - the index to append to.

Returns:

a reference to this modified **CharBuffer** (p. 817)

Exceptions:

BufferOverflowException (p. 658) if there is no more space
ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.
IndexOutOfBoundsException if start > end, or > length of sequence.

Implements **decaf::lang::Appendable** (p. 484).

6.133.3.3 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value*) throw (BufferOverflowException, ReadOnlyBufferException) [virtual]

Appends the specified character sequence to this buffer. If value is Null the the string "null" is appended to the buffer.

Parameters:

value - the CharSequence to append.

Returns:

a reference to this modified **CharBuffer** (p. 817)

Exceptions:

BufferOverflowException (p. 658) if there is no more space
ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

Implements **decaf::lang::Appendable** (p. 485).

6.133.3.4 CharBuffer& decaf::nio::CharBuffer::append (char *value*) throw (BufferOverflowException, ReadOnlyBufferException) [virtual]

Appends the specified character to this buffer.

Parameters:

value - the char to append.

Returns:

a reference to this modified **CharBuffer** (p. 817)

Exceptions:

BufferOverflowException (p. 658) if there is no more space

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

Implements **decaf::lang::Appendable** (p. 485).

6.133.3.5 `virtual char* decaf::nio::CharBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the character array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 627)

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 812).

6.133.3.6 `virtual std::size_t decaf::nio::CharBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException (p. 2167) if this **Buffer** (p. 627) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 812).

6.133.3.7 `virtual CharBuffer* decaf::nio::CharBuffer::asReadOnlyBuffer () const [pure virtual]`

Creates a new, read-only char buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new

buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only char buffer which the caller then owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 812).

6.133.3.8 char decaf::nio::CharBuffer::charAt (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Reads the character at the given index relative to the current position.

Parameters:

index - The index of the character to be read relative to position

Returns:

The character at index **position()** (p. 631) + index

Exceptions:

IndexOutOfBoundsException

Implements **decaf::lang::CharSequence** (p. 833).

6.133.3.9 virtual CharBuffer& decaf::nio::CharBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \mathbf{position}()$ (p. 631) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index **limit()** (p. 631) - 1 is copied to index $n = \mathbf{limit}()$ (p. 631) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **CharBuffer** (p. 817)

Exceptions:

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 813).

6.133.3.10 `virtual int decaf::nio::CharBuffer::compareTo (const CharBuffer & value) const` [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.133.3.11 `virtual CharBuffer* decaf::nio::CharBuffer::duplicate ()` [pure virtual]

Creates a new char buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new char **Buffer** (p. 627) which the caller owns.

Implemented in `decaf::internal::nio::CharArrayBuffer` (p. 813).

6.133.3.12 `virtual bool decaf::nio::CharBuffer::equals (const CharBuffer & value) const` [virtual]

Returns:

true if this value is considered equal to the passed value.

6.133.3.13 `CharBuffer& decaf::nio::CharBuffer::get (char * buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)`

Relative bulk get method. This method transfers chars from this buffer into the given destination array. If there are fewer chars remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 632), then no bytes are transferred and a **BufferUnderflowException** (p. 661) is thrown.

Otherwise, this method copies `length` chars from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 627)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than *length* chars remaining in this buffer

NullPointerException if the passed buffer is null.

6.133.3.14 CharBuffer& decaf::nio::CharBuffer::get (std::vector< char > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers chars from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns:

a reference to this **CharBuffer** (p. 817)

Exceptions:

BufferUnderflowException (p. 661) - If there are fewer than *length* chars remaining in this buffer

6.133.3.15 virtual char decaf::nio::CharBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the char at the given index.

Parameters:

index - the index in the **Buffer** (p. 627) where the char is to be read

Returns:

the char that is located at the given index

Exceptions:

IndexOutOfBoundsException - If *index* is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 813).

6.133.3.16 virtual char decaf::nio::CharBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method. Reads the character at this buffer's current position, and then increments the position.

Returns:

the char at the current position

Exceptions:

BufferUnderflowException (p. 661) if there no more data to return

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 814).

6.133.3.17 virtual bool decaf::nio::CharBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible char array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 814).

6.133.3.18 std::size_t decaf::nio::CharBuffer::length () const [inline, virtual]

Returns the length of this character buffer.

Returns:

the length of this buffer from the position to the limit.

Implements **decaf::lang::CharSequence** (p. 834).

6.133.3.19 virtual bool decaf::nio::CharBuffer::operator< (const CharBuffer & value) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.133.3.20 virtual bool decaf::nio::CharBuffer::operator== (const CharBuffer & value) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.133.3.21 CharBuffer& decaf::nio::CharBuffer::put (const std::string & *src*) throw (BufferOverflowException, ReadOnlyBufferException)

Relative bulk put method (optional operation). This method transfers the entire content of the given source string into this buffer. An invocation of this method of the form `dst.put(s)` behaves in exactly the same way as the invocation

Parameters:

src - the string to copy from

Returns:

a reference to this **CharBuffer** (p. 817)

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.133.3.22 CharBuffer& decaf::nio::CharBuffer::put (const std::string & *src*, std::size_t *start*, std::size_t *end*) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException)

Relative bulk put method (optional operation). This method transfers characters from the given string into this buffer. If there are more characters to be copied from the string than remain in this buffer, that is, if `end - start > remaining()` (p. 632), then no characters are transferred and a **BufferOverflowException** (p. 658) is thrown.

Returns:

a reference to this buffer

Otherwise, this method copies `n = end - start` characters from the given string into this buffer, starting at the given start index and at the current position of this buffer. The position of this buffer is then incremented by `n`.

Parameters:

src - the string to copy from

start - position in *src* to start from

end - the position in *src* to stop at

Returns:

a reference to this **CharBuffer** (p. 817)

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.133.3.23 `virtual CharBuffer& decaf::nio::CharBuffer::put (std::size_t index,
char value) throw (lang::exceptions::IndexOutOfBoundsException,
ReadOnlyBufferException)` [pure virtual]

Writes the given char into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 627) to write the data

value - the char to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::CharArrayBuffer` (p. 814).

6.133.3.24 `virtual CharBuffer& decaf::nio::CharBuffer::put (char value) throw (`
 `BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters:

value - the char value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

Implemented in `decaf::internal::nio::CharArrayBuffer` (p. 815).

6.133.3.25 `CharBuffer& decaf::nio::CharBuffer::put (std::vector< char > & buffer)`
 `throw (BufferOverflowException, ReadOnlyBufferException)`

This method transfers the entire content of the given source char array into this buffer. This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters:

buffer - The buffer whose contents are copied to this **CharBuffer** (p. 817)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

**6.133.3.26 CharBuffer& decaf::nio::CharBuffer::put (const char * *buffer*,
std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException,
ReadOnlyBufferException, lang::exceptions::NullPointerException)**

This method transfers chars into this buffer from the given source array. If there are more chars to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 632), then no chars are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters:

buffer- The array from which chars are to be read

offset- The offset within the array of the first char to be read;

length - The number of chars to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

NullPointerException if the passed buffer is null.

**6.133.3.27 CharBuffer& decaf::nio::CharBuffer::put (CharBuffer & *src*)
throw (BufferOverflowException, ReadOnlyBufferException,
lang::exceptions::IllegalArgumentException)**

This method transfers the chars remaining in the given source buffer into this buffer. If there are more chars remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 632), then no chars are transferred and a **BufferOverflowException** (p. 658) is thrown.

Otherwise, this method copies `n = src.remaining()` chars from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters:

src - the buffer to take chars from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. 658) - If there is insufficient space in this buffer for the remaining chars in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.133.3.28 `virtual std::size_t decaf::nio::CharBuffer::read (CharBuffer *
target) throw (decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
ReadOnlyBufferException) [virtual]`

Attempts to read characters into the specified character buffer. The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters:

target - the buffer to read characters into

Returns:

The number of characters added to the buffer, or string::npos if this source of characters is at its end

Exceptions:

NullPointerException - If target is Null

IllegalArgumentException - If target is this

ReadOnlyBufferException (p. 2167) - If this buffer is read-only

6.133.3.29 `virtual CharBuffer* decaf::nio::CharBuffer::slice () const [pure
virtual]`

Creates a new **CharBuffer** (p. 817) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **CharBuffer** (p. 817) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 815).

6.133.3.30 `virtual lang::CharSequence* decaf::nio::CharBuffer::subSequence (std::size_t start, std::size_t end) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position. The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 631) + start, and its limit will be **position()** (p. 631) + end. The new **Buffer** (p. 627) will be read-only if, and only if, this buffer is read-only.

Parameters:

- start* - The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 632)
- end* - The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 632)

Returns:

The new character buffer, caller owns

Exceptions:

IndexOutOfBoundsException - If the preconditions on start and end fail

Implements **decaf::lang::CharSequence** (p. 834).

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 816).

6.133.3.31 `virtual std::string decaf::nio::CharBuffer::toString () const [virtual]`

Returns:

a std::string describing this object

Implements **decaf::lang::CharSequence** (p. 834).

6.133.3.32 `static CharBuffer* decaf::nio::CharBuffer::wrap (std::vector< char > & buffer) [static]`

Wraps the passed STL char Vector in a **CharBuffer** (p. 817). The new buffer will be backed by the given char array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be **buffer.size()**, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

- buffer* - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling **vector.resize(N)**.

Returns:

a new **CharBuffer** (p. 817) that is backed by buffer, caller owns.

6.133.3.33 `static CharBuffer* decaf::nio::CharBuffer::wrap (char *
array, std::size_t offset, std::size_t length) throw (
lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new **CharBuffer** (p. 817). The new buffer will be backed by the given char array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

- array* - The array that will back the new buffer
- offset* - The offset of the subarray to be used
- length* - The length of the subarray to be used

Returns:

- a new **CharBuffer** (p. 817) that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/CharBuffer.h`

6.134 decaf::lang::CharSequence Class Reference

A **CharSequence** (p. 833) is a readable sequence of char values.

#include <src/main/decaf/lang/CharSequence.h> Inheritance diagram for decaf::lang::CharSequence:

Public Member Functions

- virtual **~CharSequence** ()
- virtual std::size_t **length** () const =0
- virtual char **charAt** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Returns the Char at the specified index so long as the index is not greater than the length of the sequence.
- virtual **CharSequence** * **subSequence** (std::size_t start, std::size_t end) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
*Returns a new **CharSequence** (p. 833) that is a subsequence of this sequence.*
- virtual std::string **toString** () const =0

6.134.1 Detailed Description

A **CharSequence** (p. 833) is a readable sequence of char values. This interface provides uniform, read-only access to many different kinds of char sequences.

This interface does not define that a **CharSequence** (p. 833) should implement comparable, it is therefore up to the dervied classes that implement this interface to define equality, which implies that comparison of two **CharSequences** does not have a contract on equality.

6.134.2 Constructor & Destructor Documentation

6.134.2.1 virtual decaf::lang::CharSequence::~~CharSequence () [inline, virtual]

6.134.3 Member Function Documentation

6.134.3.1 virtual char decaf::lang::CharSequence::charAt (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters:

index - position to return the char at.

Returns:

the char at the given position

Exceptions:

IndexOutOfBoundsException if index is > than **length()** (p. 834)

Implemented in **decaf::nio::CharBuffer** (p. 823).

6.134.3.2 `virtual std::size_t decaf::lang::CharSequence::length () const [pure virtual]`

Returns:

the length of the underlying character sequence.

Implemented in **decaf::nio::CharBuffer** (p. 826).

6.134.3.3 `virtual CharSequence* decaf::lang::CharSequence::subSequence (std::size_t start, std::size_t end) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Returns a new **CharSequence** (p. 833) that is a subsequence of this sequence. The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters:

start - the start index, inclusive

end - the end index, exclusive

Returns:

a new **CharSequence** (p. 833)

Exceptions:

IndexOutOfBoundsException if start or end > **length()** (p. 834)

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 816), and **decaf::nio::CharBuffer** (p. 831).

6.134.3.4 `virtual std::string decaf::lang::CharSequence::toString () const [pure virtual]`

Returns:

the string representation of this **CharSequence** (p. 833)

Implemented in **decaf::nio::CharBuffer** (p. 831).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/CharSequence.h`

6.135 decaf::lang::exceptions::ClassCastException Class Reference

#include <src/main/decaf/lang/exceptions/ClassCastException.h> Inheritance diagram for decaf::lang::exceptions::ClassCastException:

Public Member Functions

- **ClassCastException** () throw ()
Default Constructor.
- **ClassCastException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1268).*
- **ClassCastException** (const **ClassCastException** &ex) throw ()
Copy Constructor.
- **ClassCastException** (const std::exception *cause) throw ()
Constructor.
- **ClassCastException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ClassCastException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ClassCastException** * clone () const
Clones this exception.
- virtual ~**ClassCastException** () throw ()

6.135.1 Constructor & Destructor Documentation

6.135.1.1 decaf::lang::exceptions::ClassCastException::ClassCastException () throw () [inline]

Default Constructor.

6.135.1.2 decaf::lang::exceptions::ClassCastException::ClassCastException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1268).

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.135.1.3 decaf::lang::exceptions::ClassCastException::ClassCastException (const ClassCastException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1268) whose data is to be copied into this one.

6.135.1.4 decaf::lang::exceptions::ClassCastException::ClassCastException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2011) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.135.1.5 decaf::lang::exceptions::ClassCastException::ClassCastException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.135.1.6 decaf::lang::exceptions::ClassCastException::ClassCastException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.135.1.7 virtual decaf::lang::exceptions::ClassCastException::~~ClassCastException
() throw () [inline, virtual]

6.135.2 Member Function Documentation

6.135.2.1 virtual ClassCastException* de-
caf::lang::exceptions::ClassCastException::clone () const
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1268) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1271).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**ClassCastException.h**

6.136 cms::Closeable Class Reference

Interface for a class that implements the close method.

#include <src/main/cms/Closeable.h> Inheritance diagram for cms::Closeable:

Public Member Functions

- virtual `~Closeable()`
- virtual void `close()` throw (CMSEException)
Closes this object and deallocates the appropriate resources.

6.136.1 Detailed Description

Interface for a class that implements the close method. A class that implements this interface should release all resources upon the close call and should throw an exception from any methods that require those resources after they have been closed.

Since:

1.0

6.136.2 Constructor & Destructor Documentation

6.136.2.1 virtual cms::Closeable::~~Closeable() [inline, virtual]

6.136.3 Member Function Documentation

6.136.3.1 virtual void cms::Closeable::close() throw (CMSEException) [pure virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSEException (p. 850) - If an error occurs while the resource is being closed.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 774), `activemq::cmsutil::CachedProducer` (p. 778), `activemq::cmsutil::PooledSession` (p. 2021), `activemq::commands::ActiveMQTempDestination` (p. 400), `activemq::core::ActiveMQConnection` (p. 193), `activemq::core::ActiveMQConsumer` (p. 222), `activemq::core::ActiveMQProducer` (p. 327), `activemq::core::ActiveMQSession` (p. 356), `activemq::transport::correlator::ResponseCorrelator` (p. 2238), `activemq::transport::failover::FailoverTransport` (p. 1299), `activemq::transport::IOTransport` (p. 1482), `activemq::transport::mock::MockTransport` (p. 1912), `activemq::transport::tcp::TcpTransport` (p. 2533), `activemq::transport::TransportFilter` (p. 2618), `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 1985), `cms::Connection` (p. 942), and `cms::Session` (p. 2273).

The documentation for this class was generated from the following file:

- `src/main/cms/Closeable.h`

6.137 decaf::io::Closeable Class Reference

Interface for a class that implements the close method.

#include <src/main/decaf/io/Closeable.h> Inheritance diagram for decaf::io::Closeable:

Public Member Functions

- virtual `~Closeable()`
- virtual void `close()` throw (lang::Exception)
Closes this object and deallocates the appropriate resources.

6.137.1 Detailed Description

Interface for a class that implements the close method.

6.137.2 Constructor & Destructor Documentation

6.137.2.1 virtual decaf::io::Closeable::~~Closeable() [inline, virtual]

6.137.3 Member Function Documentation

6.137.3.1 virtual void decaf::io::Closeable::close() throw (lang::Exception) [pure virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

CMSEException

Implemented in `decaf::internal::io::StandardErrorOutputStream` (p. 2400), `decaf::internal::io::StandardInputStream` (p. 2404), `decaf::internal::io::StandardOutputStream` (p. 2410), `decaf::io::BlockingByteArrayInputStream` (p. 568), `decaf::io::BufferedInputStream` (p. 635), `decaf::io::BufferedOutputStream` (p. 639), `decaf::io::ByteArrayInputStream` (p. 718), `decaf::io::ByteArrayOutputStream` (p. 724), `decaf::io::FilterInputStream` (p. 1317), `decaf::io::FilterOutputStream` (p. 1324), `decaf::net::BufferedSocket` (p. 642), `decaf::net::SocketInputStream` (p. 2385), `decaf::net::SocketOutputStream` (p. 2391), `decaf::net::TcpSocket` (p. 2526), and `decaf::util::logging::StreamHandler` (p. 2473).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/Closeable.h`

6.138 activemq::transport::failover::CloseTransportsTask Class Reference

#include <src/main/activemq/transport/failover/CloseTransportsTask.h> Inheritance diagram for activemq::transport::failover::CloseTransportsTask:

Public Member Functions

- **CloseTransportsTask** ()
- virtual **~CloseTransportsTask** ()
- void **add** (const **Pointer**< **Transport** > &transport)
*Add a new **Transport** (p. 2608) to close.*
- virtual bool **isPending** () const
This Task is pending if there are transports in the Queue that need to be closed.
- virtual bool **iterate** ()
Return true until all transports have been closed and removed from the queue.

6.138.1 Constructor & Destructor Documentation

6.138.1.1 **activemq::transport::failover::CloseTransportsTask::CloseTransportsTask** () [inline]

6.138.1.2 **virtual**
activemq::transport::failover::CloseTransportsTask::~~CloseTransportsTask () [inline, virtual]

6.138.2 Member Function Documentation

6.138.2.1 **void** **activemq::transport::failover::CloseTransportsTask::add** (const **Pointer**< **Transport** > & *transport*)

Add a new **Transport** (p. 2608) to close.

6.138.2.2 **virtual bool** **activemq::transport::failover::CloseTransportsTask::isPending** () const [virtual]

This Task is pending if there are transports in the Queue that need to be closed.

Returns:

true if there is a **transport** (p. 67) in the queue that needs closed.

Implements **activemq::threads::CompositeTask** (p. 906).

6.138.2.3 `virtual bool activemq::transport::failover::CloseTransportsTask::iterate ()` [virtual]

Return true until all transports have been closed and removed from the queue.

Implements **`activemq::threads::Task`** (p. 2520).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/failover/CloseTransportsTask.h`

6.139 activemq::cmsutil::CmsAccessor Class Reference

Base class for **activemq.cmsutil.CmsTemplate** (p. 858) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 978) to operate on.

#include <src/main/activemq/cmsutil/CmsAccessor.h> Inheritance diagram for activemq::cmsutil::CmsAccessor:

Public Member Functions

- **CmsAccessor** ()
- virtual **~CmsAccessor** ()
- virtual **ResourceLifecycleManager** * **getResourceLifecycleManager** ()
- virtual const **ResourceLifecycleManager** * **getResourceLifecycleManager** () const
- virtual void **setConnectionFactory** (cms::ConnectionFactory *connectionFactory)
Set the ConnectionFactory to use for obtaining CMS Connections.
- virtual const cms::ConnectionFactory * **getConnectionFactory** () const
Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.
- virtual cms::ConnectionFactory * **getConnectionFactory** ()
Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.
- virtual void **setSessionAcknowledgeMode** (cms::Session::AcknowledgeMode sessionAcknowledgeMode)
Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.
- virtual cms::Session::AcknowledgeMode **getSessionAcknowledgeMode** () const
Return the acknowledgment mode for CMS sessions.

Protected Member Functions

- virtual void **init** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Initializes this object and prepares it for use.
- virtual void **destroy** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Shuts down this object and destroys any allocated resources.
- virtual cms::Connection * **createConnection** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Create a CMS Connection via this template's ConnectionFactory.
- virtual cms::Session * **createSession** (cms::Connection *con) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)

Create a CMS Session for the given Connection.

- virtual void **checkConnectionFactory** () throw (decaf::lang::exceptions::IllegalStateException)

Verifies that the connection factory is valid.

6.139.1 Detailed Description

Base class for **activemq.cmsutil.CmsTemplate** (p. 858) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 978) to operate on. The subclass **activemq.cmsutil.CmsDestinationAccessor** (p. 847) adds further, destination-related properties.

Not intended to be used directly.

See also:

activemq.cmsutil.CmsDestinationAccessor (p. 847)
activemq.cmsutil.CmsTemplate (p. 858)

6.139.2 Constructor & Destructor Documentation

6.139.2.1 **activemq::cmsutil::CmsAccessor::CmsAccessor** ()

6.139.2.2 **virtual activemq::cmsutil::CmsAccessor::~~CmsAccessor** () [virtual]

6.139.3 Member Function Documentation

6.139.3.1 **virtual void activemq::cmsutil::CmsAccessor::checkConnectionFactory** () throw (decaf::lang::exceptions::IllegalStateException) [protected, virtual]

Verifies that the connection factory is valid.

6.139.3.2 **virtual cms::Connection* activemq::cmsutil::CmsAccessor::createConnection** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [protected, virtual]

Create a CMS Connection via this template's ConnectionFactory.

Returns:

the new CMS Connection

Exceptions:

cms::CMSException (p. 850) if thrown by CMS API methods

6.139.3.3 `virtual cms::Session* activemq::cmsutil::CmsAccessor::createSession (cms::Connection * con) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [protected, virtual]`

Create a CMS Session for the given Connection.

Parameters:

con the CMS Connection to create a Session for

Returns:

the new CMS Session

Exceptions:

cms::CMSException (p. 850) if thrown by CMS API methods

6.139.3.4 `virtual void activemq::cmsutil::CmsAccessor::destroy () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [inline, protected, virtual]`

Shuts down this object and destroys any allocated resources.

Reimplemented in `activemq::cmsutil::CmsDestinationAccessor` (p.848), and `activemq::cmsutil::CmsTemplate` (p.861).

6.139.3.5 `virtual cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () [inline, virtual]`

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.139.3.6 `virtual const cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () const [inline, virtual]`

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.139.3.7 `virtual const ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () const [inline, virtual]`

6.139.3.8 `virtual ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () [inline, virtual]`

6.139.3.9 `virtual cms::Session::AcknowledgeMode activemq::cmsutil::CmsAccessor::getSessionAcknowledgeMode () const [inline, virtual]`

Return the acknowledgment mode for CMS sessions.

Returns:

the acknowledgment mode applied by this accessor

6.139.3.10 `virtual void activemq::cmsutil::CmsAccessor::init () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [inline, protected, virtual]`

Initializes this object and prepares it for use. This should be called before any other methods are called. This version does nothing.

Reimplemented in `activemq::cmsutil::CmsDestinationAccessor` (p. 848), and `activemq::cmsutil::CmsTemplate` (p. 864).

6.139.3.11 `virtual void activemq::cmsutil::CmsAccessor::setConnectionFactory (cms::ConnectionFactory * connectionFactory) [inline, virtual]`

Set the ConnectionFactory to use for obtaining CMS Connections.

6.139.3.12 `virtual void activemq::cmsutil::CmsAccessor::setSessionAcknowledgeMode (cms::Session::AcknowledgeMode sessionAcknowledgeMode) [inline, virtual]`

Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message. Default is AUTO_ACKNOWLEDGE.

Parameters:

sessionAcknowledgeMode the acknowledgment mode

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CmsAccessor.h`

6.140 activemq::cmsutil::CmsDestinationAccessor Class Reference

Extends the `CmsAccessor` (p. 843) to add support for resolving destination names.

`#include <src/main/activemq/cmsutil/CmsDestinationAccessor.h>` Inheritance diagram for `activemq::cmsutil::CmsDestinationAccessor`:

Public Member Functions

- `CmsDestinationAccessor ()`
- `virtual ~CmsDestinationAccessor ()`
- `virtual bool isPubSubDomain () const`
- `virtual void setPubSubDomain (bool pubSubDomain)`
- `virtual DestinationResolver * getDestinationResolver ()`
- `virtual const DestinationResolver * getDestinationResolver () const`
- `virtual void setDestinationResolver (DestinationResolver *destRes)`

Protected Member Functions

- `virtual void init () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)`
Initializes the destination resolver.
- `virtual void destroy () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)`
Calls `destroy()` (p. 848) on the destination resolver.
- `virtual cms::Destination * resolveDestinationName (cms::Session *session, const std::string &destName) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)`
Resolves the destination via the `DestinationResolver` (p. 1211).
- `virtual void checkDestinationResolver () throw (decaf::lang::exceptions::IllegalStateException)`
Verifies that the destination resolver is valid.

6.140.1 Detailed Description

Extends the `CmsAccessor` (p. 843) to add support for resolving destination names. Not intended to be used directly.

6.140.3 Member Function Documentation

6.140.3.1 `virtual void ac-
tivemq::cmsutil::CmsDestinationAccessor::checkDestinationResolver ()
throw (decaf::lang::exceptions::IllegalStateException) [protected,
virtual]`

Verifies that the destination resolver is valid.

6.140.3.2 `virtual void activemq::cmsutil::CmsDestinationAccessor::destroy () throw
(cms::CMSException, decaf::lang::exceptions::IllegalStateException)
[protected, virtual]`

Calls `destroy()` (p. 848) on the destination resolver.

Reimplemented from `activemq::cmsutil::CmsAccessor` (p. 845).

Reimplemented in `activemq::cmsutil::CmsTemplate` (p. 861).

6.140.3.3 `virtual const DestinationResolver* ac-
tivemq::cmsutil::CmsDestinationAccessor::getDestinationResolver ()
const [inline, virtual]`

6.140.3.4 `virtual DestinationResolver* ac-
tivemq::cmsutil::CmsDestinationAccessor::getDestinationResolver ()
[inline, virtual]`

6.140.3.5 `virtual void activemq::cmsutil::CmsDestinationAccessor::init () throw
(cms::CMSException, decaf::lang::exceptions::IllegalStateException)
[protected, virtual]`

Initializes the destination resolver.

Reimplemented from `activemq::cmsutil::CmsAccessor` (p. 846).

Reimplemented in `activemq::cmsutil::CmsTemplate` (p. 864).

6.140.3.6 virtual bool activemq::cmsutil::CmsDestinationAccessor::isPubSubDomain () const [inline, virtual]

6.140.3.7 virtual cms::Destination* activemq::cmsutil::CmsDestinationAccessor::resolveDestinationName (cms::Session * *session*, const std::string & *destName*) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [protected, virtual]

Resolves the destination via the DestinationResolver (p. 1211).

Parameters:

session the session

destName the name of the destination.

Returns:

the destination

Exceptions:

cms::CMSException (p. 850) if resolution failed.

decaf::lang::exceptions::IllegalStateException (p. 1400) if the destination resolver property is NULL.

6.140.3.8 virtual void activemq::cmsutil::CmsDestinationAccessor::setDestinationResolver (DestinationResolver * *destRes*) [inline, virtual]

6.140.3.9 virtual void activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain (bool *pubSubDomain*) [inline, virtual]

Reimplemented in **activemq::cmsutil::CmsTemplate** (p. 869).

Referenced by **activemq::cmsutil::CmsTemplate::setPubSubDomain()**.

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CmsDestinationAccessor.h`

6.141 cms::CMSException Class Reference

CMS API Exception that is the base for all exceptions thrown from CMS classes.

#include <src/main/cms/CMSException.h> Inheritance diagram for cms::CMSException:

Public Member Functions

- **CMSException** () throw ()
- **CMSException** (const **CMSException** &ex) throw ()
- **CMSException** (const std::string &message, const std::exception *cause) throw ()
- **CMSException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**CMSException** () throw ()
- virtual std::string **getMessage** () const
Gets the cause of the error.
- virtual const std::exception * **getCause** () const
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **setMark** (const char *file, const int lineNumber)
Adds a file/line number to the stack trace.
- virtual void **printStackTrace** () const
Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) const
Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () const
Gets the stack trace as one contiguous string.

6.141.1 Detailed Description

CMS API Exception that is the base for all exceptions thrown from CMS classes. This class represents an error that has occurred in CMS, providers can wrap provider specific exceptions in this class by setting the cause to an instance of a provider specific exception provided it can be cast to an std::exception.

Since the contained cause exception is of type std::exception and the C++ exception class has no clone or copy method defined the contained exception can only be owned by one instance of an **CMSException** (p. 850). To that end the class hands off the exception to each successive copy so care must be taken when handling **CMSException** (p. 850) instances.

Since:

1.0

6.141.2 Constructor & Destructor Documentation

6.141.2.1 cms::CMSException::CMSException () throw ()

6.141.2.2 cms::CMSException::CMSException (const CMSException & *ex*) throw ()

6.141.2.3 cms::CMSException::CMSException (const std::string & *message*, const std::exception * *cause*) throw ()

6.141.2.4 cms::CMSException::CMSException (const std::string & *message*, const std::exception * *cause*, const std::vector< std::pair< std::string, int > > & *stackTrace*) throw ()

6.141.2.5 virtual cms::CMSException::~~CMSException () throw () [virtual]

6.141.3 Member Function Documentation

6.141.3.1 virtual const std::exception* cms::CMSException::getCause () const [virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

6.141.3.2 virtual std::string cms::CMSException::getMessage () const [virtual]

Gets the cause of the error.

Returns:

string errors message

6.141.3.3 virtual std::vector< std::pair< std::string, int> > cms::CMSException::getStackTrace () const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns:

vector containing stack trace strings

6.141.3.4 `virtual std::string cms::CMSException::getStackTraceString () const`
[virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data

6.141.3.5 `virtual void cms::CMSException::printStackTrace (std::ostream &`
`stream) const` [virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

6.141.3.6 `virtual void cms::CMSException::printStackTrace () const` [virtual]

Prints the stack trace to std::err.

6.141.3.7 `virtual void cms::CMSException::setMark (const char * file, const int`
`lineNumber)` [virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use `__FILE__`).

lineNumber The line number in the calling file (use `__LINE__`).

The documentation for this class was generated from the following file:

- `src/main/cms/CMSException.h`

6.142 cms::CMSProperties Class Reference

Interface for a Java-like properties object.

#include <src/main/cms/CMSProperties.h> Inheritance diagram for cms::CMSProperties:

Public Member Functions

- virtual **~CMSProperties** ()
- virtual bool **isEmpty** () const =0
Returns true if the properties object is empty.
- virtual const char * **getProperty** (const std::string &name) const =0
Looks up the value for the given property.
- virtual std::string **getProperty** (const std::string &name, const std::string &defaultValue) const =0
Looks up the value for the given property.
- virtual void **setProperty** (const std::string &name, const std::string &value)=0
Sets the value for a given property.
- virtual bool **hasProperty** (const std::string &name) const =0
Check to see if the Property exists in the set.
- virtual void **remove** (const std::string &name)=0
Removes the property with the given name.
- virtual std::vector< std::pair< std::string, std::string > > **toArray** () const =0
Method that serializes the contents of the property map to an array.
- virtual void **copy** (const **CMSProperties** *source)=0
Copies the contents of the given properties object to this one.
- virtual **CMSProperties** * **clone** () const =0
Clones this object.
- virtual void **clear** ()=0
Clears all properties from the map.
- virtual std::string **toString** () const =0
Formats the contents of the Properties Object into a string that can be logged, etc.

6.142.1 Detailed Description

Interface for a Java-like properties object. This is essentially a map of key-value string pairs.

Since:

1.1

6.142.2 Constructor & Destructor Documentation

6.142.2.1 `virtual cms::CMSProperties::~~CMSProperties () [inline, virtual]`

6.142.3 Member Function Documentation

6.142.3.1 `virtual void cms::CMSProperties::clear () [pure virtual]`

Clears all properties from the map.

Implemented in `activemq::util::ActiveMQProperties` (p. 333).

6.142.3.2 `virtual CMSProperties* cms::CMSProperties::clone () const [pure virtual]`

Clones this object.

Returns:

a replica of this object.

Implemented in `activemq::util::ActiveMQProperties` (p. 333).

6.142.3.3 `virtual void cms::CMSProperties::copy (const CMSProperties * source) [pure virtual]`

Copies the contents of the given properties object to this one.

Parameters:

source The source properties object.

6.142.3.4 `virtual std::string cms::CMSProperties::getProperty (const std::string & name, const std::string & defaultValue) const [pure virtual]`

Looks up the value for the given property.

Parameters:

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns:

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

Implemented in `activemq::util::ActiveMQProperties` (p. 334).

6.142.3.5 `virtual const char* cms::CMSProperties::getProperty (const std::string & name) const` [pure virtual]

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

Returns:

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implemented in `activemq::util::ActiveMQProperties` (p. 334).

6.142.3.6 `virtual bool cms::CMSProperties::hasProperty (const std::string & name) const` [pure virtual]

Check to see if the Property exists in the set.

Parameters:

name the name of the property to check

Returns:

true if property exists, false otherwise.

Implemented in `activemq::util::ActiveMQProperties` (p. 334).

6.142.3.7 `virtual bool cms::CMSProperties::isEmpty () const` [pure virtual]

Returns true if the properties object is empty.

Returns:

true if empty

Implemented in `activemq::util::ActiveMQProperties` (p. 335).

6.142.3.8 `virtual void cms::CMSProperties::remove (const std::string & name)` [pure virtual]

Removes the property with the given name.

Parameters:

name the name of the property to be removed.s

Implemented in `activemq::util::ActiveMQProperties` (p. 335).

6.142.3.9 `virtual void cms::CMSProperties::setProperty (const std::string & name,
const std::string & value)` [pure virtual]

Sets the value for a given property. If the property already exists, overwrites the value.

Parameters:

name The name of the value to be written.

value The value to be written.

Implemented in `activemq::util::ActiveMQProperties` (p. 335).

6.142.3.10 `virtual std::vector< std::pair< std::string, std::string > >
cms::CMSProperties::toArray () const` [pure virtual]

Method that serializes the contents of the property map to an array.

Returns:

list of pairs where the first is the name and the second is the value.

Implemented in `activemq::util::ActiveMQProperties` (p. 335).

6.142.3.11 `virtual std::string cms::CMSProperties::toString () const` [pure
virtual]

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns:

string value of this object.

Implemented in `activemq::util::ActiveMQProperties` (p. 335).

- virtual long long **getReceiveTimeout** () const
- virtual void **setExplicitQosEnabled** (bool explicitQosEnabled)
Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

- virtual bool **isExplicitQosEnabled** () const
If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message.
- virtual void **setDeliveryPersistent** (bool deliveryPersistent)
Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").
- virtual void **setDeliveryMode** (int deliveryMode)
Set the delivery mode to use when sending a message.
- virtual int **getDeliveryMode** () const
Return the delivery mode to use when sending a message.
- virtual void **setPriority** (int priority)
Set the priority of a message when sending.
- virtual int **getPriority** () const
Return the priority of a message when sending.
- virtual void **setTimeToLive** (long long timeToLive)
Set the time-to-live of the message when sending.
- virtual long long **getTimeToLive** () const
Return the time-to-live of the message when sending.
- virtual void **execute** (SessionCallback *action) throw (cms::CMSEException)
Executes the given action within a CMS Session.
- virtual void **execute** (ProducerCallback *action) throw (cms::CMSEException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **execute** (cms::Destination *dest, ProducerCallback *action) throw (cms::CMSEException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **execute** (const std::string &destinationName, ProducerCallback *action) throw (cms::CMSEException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **send** (MessageCreator *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the default destination.
- virtual void **send** (cms::Destination *dest, MessageCreator *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the specified destination.
- virtual void **send** (const std::string &destinationName, MessageCreator *messageCreator) throw (cms::CMSEException)

Convenience method for sending a message to the specified destination.

- virtual **cms::Message** * **receive** () throw (cms::CMSEException)
Performs a synchronous read from the default destination.
- virtual **cms::Message** * **receive** (cms::Destination *destination) throw (cms::CMSEException)
Performs a synchronous read from the specified destination.
- virtual **cms::Message** * **receive** (const std::string &destinationName) throw (cms::CMSEException)
Performs a synchronous read from the specified destination.
- virtual **cms::Message** * **receiveSelected** (const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read consuming only messages identified by the given selector.
- virtual **cms::Message** * **receiveSelected** (cms::Destination *destination, const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.
- virtual **cms::Message** * **receiveSelected** (const std::string &destinationName, const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Static Public Attributes

- static const long long **RECEIVE_TIMEOUT_NO_WAIT** = -1
Timeout value indicating that a receive operation should check if a message is immediately available without blocking.
- static const long long **RECEIVE_TIMEOUT_INDEFINITE_WAIT** = 0
Timeout value indicating a blocking receive without timeout.
- static const int **DEFAULT_PRIORITY** = 4
Default message priority.
- static const long long **DEFAULT_TIME_TO_LIVE** = 0
My default, messages should live forever.

Protected Member Functions

- void **init** () throw (cms::CMSEException, decaf::lang::exceptions::IllegalStateException)
Initializes this object and prepares it for use.

- void **destroy** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)

Clears all internal resources.

- class **SendExecutor**
- class **ReceiveExecutor**
- class **ResolveReceiveExecutor**

6.144.1 Detailed Description

CmsTemplate (p. 858) simplifies performing synchronous CMS operations. This class is intended to be for CMS what Spring's **JmsTemplate** is for JMS. Provided with a CMS **ConnectionFactory**, creates and manages all other CMS resources internally.

Before using **CmsTemplate** (p. 858) the user must first set the destination (either by name or by setting the destination object directly) and then call **init** to initialize the object for use.

CmsTemplate (p. 858) allows the user to get access to a CMS **Session** through a user-defined **SessionCallback** (p. 2283). Similarly, if the user wants direct access to a CMS **MessageProducer**, it can provide a **ProducerCallback** (p. 2102). As a convenience, the user can bypass having to provide callbacks altogether for sending messages, by calling one of the **send** methods.

See also:

SessionCallback (p. 2283)
ProducerCallback (p. 2102)
MessageCreator (p. 1799)

6.144.2 Constructor & Destructor Documentation

6.144.2.1 **activemq::cmsutil::CmsTemplate::CmsTemplate** ()

6.144.2.2 **activemq::cmsutil::CmsTemplate::CmsTemplate** (cms::ConnectionFactory * *connectionFactory*)

6.144.2.3 **virtual activemq::cmsutil::CmsTemplate::~~CmsTemplate** () [virtual]

6.144.3 Member Function Documentation

6.144.3.1 **void activemq::cmsutil::CmsTemplate::destroy** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
 [protected, virtual]

Clears all internal resources.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 848).

6.144.3.2 `virtual void activemq::cmsutil::CmsTemplate::execute (const std::string & destinationName, ProducerCallback * action) throw (cms::CMSEException)` [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters:

destinationName the name of the destination to send messages to (to internally be resolved to an actual destination)

action the action to perform

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs.

6.144.3.3 `virtual void activemq::cmsutil::CmsTemplate::execute (cms::Destination * dest, ProducerCallback * action) throw (cms::CMSEException)` [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters:

dest the destination to send messages to

action the action to perform

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs.

6.144.3.4 `virtual void activemq::cmsutil::CmsTemplate::execute (ProducerCallback * action) throw (cms::CMSEException)` [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters:

action the action to perform

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs.

6.144.3.5 `virtual void activemq::cmsutil::CmsTemplate::execute (SessionCallback * action) throw (cms::CMSEException)` [virtual]

Executes the given action within a CMS Session.

Parameters:

action the action to perform within a CMS Session

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs.

6.144.3.6 `virtual cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination ()`
[inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns:

the default destination. Non-const version of this method.

6.144.3.7 `virtual const cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () const`
[inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns:

the default destination. Const version of this method.

6.144.3.8 `virtual const std::string activemq::cmsutil::CmsTemplate::getDefaultDestinationName () const`
[inline, virtual]

Gets the name of the default destination to be used for send/receive operations. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Returns:

the default name of the destination for send/receive operations.

6.144.3.9 `virtual int activemq::cmsutil::CmsTemplate::getDeliveryMode () const`
[inline, virtual]

Return the delivery mode to use when sending a message.

6.144.3.10 `virtual int activemq::cmsutil::CmsTemplate::getPriority () const`
[inline, virtual]

Return the priority of a message when sending.

6.144.3.11 `virtual long long activemq::cmsutil::CmsTemplate::getReceiveTimeout () const` [inline, virtual]

6.144.3.12 `virtual long long activemq::cmsutil::CmsTemplate::getTimeToLive () const` [inline, virtual]

Return the time-to-live of the message when sending.

6.144.3.13 `void activemq::cmsutil::CmsTemplate::init () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)`
[protected, virtual]

Initializes this object and prepares it for use. This should be called before any other methods are called.

Reimplemented from `activemq::cmsutil::CmsDestinationAccessor` (p. 848).

6.144.3.14 `virtual bool activemq::cmsutil::CmsTemplate::isExplicitQosEnabled ()`
`const` [inline, virtual]

If "true", then the values of `deliveryMode`, `priority`, and `timeToLive` will be used when sending a message. Otherwise, the default values, that may be set administratively, will be used.

Returns:

true if overriding default values of QOS parameters (`deliveryMode`, `priority`, and `timeToLive`)

See also:

`setDeliveryMode` (p. 868)

`setPriority` (p. 869)

`setTimeToLive` (p. 869)

6.144.3.15 `virtual bool activemq::cmsutil::CmsTemplate::isMessageIdEnabled ()`
`const` [inline, virtual]

6.144.3.16 `virtual bool activemq::cmsutil::CmsTemplate::isMessageTimestampEnabled ()` `const`
[inline, virtual]

6.144.3.17 `virtual bool activemq::cmsutil::CmsTemplate::isNoLocal ()` `const`
[inline, virtual]

6.144.3.18 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (const std::string & destinationName) throw (cms::CMSException)`
[virtual]

Performs a synchronous read from the specified destination.

Parameters:

destinationName the name of the destination to receive on (will be resolved to destination internally).

Returns:

the message

Exceptions:

cms::CMSException (p. 850) thrown if an error occurs

6.144.3.19 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (cms::Destination * destination) throw (cms::CMSEException) [virtual]`

Performs a synchronous read from the specified destination.

Parameters:

destination the destination to receive on

Returns:

the message

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs

6.144.3.20 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive () throw (cms::CMSEException) [virtual]`

Performs a synchronous read from the default destination.

Returns:

the message

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs

6.144.3.21 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & destinationName, const std::string & selector) throw (cms::CMSEException) [virtual]`

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters:

destinationName the name of the destination to receive on (will be resolved to destination internally).

selector the selector expression.

Returns:

the message

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs

6.144.3.22 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (cms::Destination * destination, const std::string & selector) throw (cms::CMSException)` [virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters:

destination the destination to receive on.

selector the selector expression.

Returns:

the message

Exceptions:

cms::CMSException (p. 850) thrown if an error occurs

6.144.3.23 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & selector) throw (cms::CMSException)` [virtual]

Performs a synchronous read consuming only messages identified by the given selector.

Parameters:

selector the selector expression.

Returns:

the message

Exceptions:

cms::CMSException (p. 850) thrown if an error occurs

6.144.3.24 `virtual void activemq::cmsutil::CmsTemplate::send (const std::string & destinationName, MessageCreator * messageCreator) throw (cms::CMSException)` [virtual]

Convenience method for sending a message to the specified destination.

Parameters:

destinationName The name of the destination to send to.

messageCreator Responsible for creating the message to be sent

Exceptions:

cms::CMSException (p. 850) thrown if an error occurs.

6.144.3.25 `virtual void activemq::cmsutil::CmsTemplate::send (cms::Destination * dest, MessageCreator * messageCreator) throw (cms::CMSEException)` [virtual]

Convenience method for sending a message to the specified destination.

Parameters:

dest The destination to send to

messageCreator Responsible for creating the message to be sent

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs.

6.144.3.26 `virtual void activemq::cmsutil::CmsTemplate::send (MessageCreator * messageCreator) throw (cms::CMSEException)` [virtual]

Convenience method for sending a message to the default destination.

Parameters:

messageCreator Responsible for creating the message to be sent

Exceptions:

cms::CMSEException (p. 850) thrown if an error occurs.

6.144.3.27 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestination (cms::Destination * defaultDestination)` [inline, virtual]

Sets the destination object to be used by default for send/receive operations. If no default destination is provided, the `defaultDestinationName` property is used to resolve this default destination for send/receive operations.

Parameters:

defaultDestination the default destination

6.144.3.28 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestinationName (const std::string & defaultDestinationName)` [inline, virtual]

Sets the name of the default destination to be used from send/receive operations. Calling this method will set the `defaultDestination` property to NULL. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Parameters:

defaultDestinationName the name of the destination for send/receive to by default.

6.144.3.29 `virtual void activemq::cmsutil::CmsTemplate::setDeliveryMode (int deliveryMode)` [inline, virtual]

Set the delivery mode to use when sending a message. Default is the Message default: "PERSISTENT".

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters:

deliveryMode the delivery mode to use

See also:

`isExplicitQosEnabled` (p. 864)

6.144.3.30 `virtual void activemq::cmsutil::CmsTemplate::setDeliveryPersistent (bool deliveryPersistent)` [inline, virtual]

Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false"). This will set the delivery mode accordingly, to either "PERSISTENT" or "NON_PERSISTENT".

Default it "true" aka delivery mode "PERSISTENT".

See also:

`setDeliveryMode(int)` (p. 868)

6.144.3.31 `virtual void activemq::cmsutil::CmsTemplate::setExplicitQosEnabled (bool explicitQosEnabled)` [inline, virtual]

Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

See also:

`setDeliveryMode` (p. 868)

`setPriority` (p. 869)

`setTimeToLive` (p. 869)

- 6.144.3.32** `virtual void activemq::cmsutil::CmsTemplate::setMessageIdEnabled (bool messageIdEnabled) [inline, virtual]`
- 6.144.3.33** `virtual void activemq::cmsutil::CmsTemplate::setMessageTimestampEnabled (bool messageTimestampEnabled) [inline, virtual]`
- 6.144.3.34** `virtual void activemq::cmsutil::CmsTemplate::setNoLocal (bool noLocal) [inline, virtual]`
- 6.144.3.35** `virtual void activemq::cmsutil::CmsTemplate::setPriority (int priority) [inline, virtual]`

Set the priority of a message when sending. Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

See also:

`isExplicitQosEnabled` (p. 864)

- 6.144.3.36** `virtual void activemq::cmsutil::CmsTemplate::setPubSubDomain (bool pubSubDomain) [inline, virtual]`

Indicates whether the default destination is a topic (true) or a queue (false). Calling this method will set the `defaultDestination` property to NULL.

Parameters:

pubSubDomain indicates whether to use pub-sub messaging (topics).

Reimplemented from `activemq::cmsutil::CmsDestinationAccessor` (p. 849).

References `activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain()`.

- 6.144.3.37** `virtual void activemq::cmsutil::CmsTemplate::setReceiveTimeout (long long receiveTimeout) [inline, virtual]`
- 6.144.3.38** `virtual void activemq::cmsutil::CmsTemplate::setTimeToLive (long long timeToLive) [inline, virtual]`

Set the time-to-live of the message when sending. Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters:

timeToLive the message's lifetime (in milliseconds)

See also:

`isExplicitQosEnabled` (p. 864)

```

Public Member Functions

- virtual **~Collection** ()
- virtual bool **add** (const E &value)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)
Returns true if this collection changed as a result of the call.
- virtual bool **addAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)
Adds all of the elements in the specified collection to this collection.
- virtual void **clear** ()=0 throw (lang::exceptions::UnsupportedOperationException)
Removes all of the elements from this collection (optional operation).
- virtual bool **contains** (const E &value) const =0 throw (lang::Exception)
Returns true if this collection contains the specified element.
- virtual bool **containsAll** (const **Collection**< E > &collection) const =0 throw (lang::Exception)
Returns true if this collection contains all of the elements in the specified collection.
- virtual bool **equals** (const **Collection**< E > &value) const =0
Compares the passed collection to this one, if they contain the same elements, i.e.
- virtual bool **isEmpty** () const =0
- virtual bool **remove** (const E &value)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes a single instance of the specified element from the collection.
- virtual bool **removeAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes all this collection's elements that are also contained in the specified collection (optional operation).
- virtual bool **retainAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Retains only the elements in this collection that are contained in the specified collection (optional operation).

- virtual std::size_t **size** () const =0

Returns the number of elements in this collection.

- virtual std::vector< E > **toArray** () const =0

Returns an array containing all of the elements in this collection.

6.145.1 Detailed Description

template<typename E> class decaf::util::Collection< E >

The root interface in the collection hierarchy. A collection represents a group of objects, known as its elements. Some collections allow duplicate elements and others do not. Some are ordered and others unordered. This interface is typically used to pass collections around and manipulate them where maximum generality is desired.

All general-purpose **Collection** (p. 871) implementation classes (which typically implement **Collection** (p. 871) indirectly through one of its subinterfaces) should provide two "standard" constructors: a void (no arguments) constructor, which creates an empty collection, and a constructor with a single argument of type **Collection** (p. 871), which creates a new collection with the same elements as its argument. In effect, the latter constructor allows the user to copy any collection, producing an equivalent collection of the desired implementation type. There is no way to enforce this convention (as interfaces cannot contain constructors) but all of the general-purpose **Collection** (p. 871) implementations in the Decaf platform libraries comply.

The "destructive" methods contained in this interface, that is, the methods that modify the collection on which they operate, are specified to throw `UnsupportedOperationException` if this collection does not support the operation. If this is the case, these methods may, but are not required to, throw an `UnsupportedOperationException` if the invocation would have no effect on the collection. For example, invoking the `addAll(Collection)` method on an unmodifiable collection may, but is not required to, throw the exception if the collection to be added is empty.

Many methods in Collections Framework interfaces are defined in terms of the `equals` method. For example, the specification for the `contains(Object o)` method says: returns true if and only if this collection contains at least one element `e` such that `(o==null ? e==null : o.equals(e))`.

Since:

1.0

6.145.2 Constructor & Destructor Documentation

6.145.2.1 `template<typename E> virtual decaf::util::Collection< E >::~~Collection()` [inline, virtual]

6.145.3 Member Function Documentation

6.145.3.1 `template<typename E> virtual bool decaf::util::Collection< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)` [pure virtual]

Returns true if this collection changed as a result of the call. (Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 871) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value - reference to the element to add.

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implemented in `decaf::util::AbstractQueue< E >` (p. 137), `decaf::util::StlList< E >` (p. 2421), `decaf::util::StlSet< E >` (p. 2448), `decaf::util::StlList< CompositeTask * >` (p. 2421), `decaf::util::StlList< URI >` (p. 2421), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2421), `decaf::util::StlList< PrimitiveValueNode >` (p. 2421), `decaf::util::StlList< Pointer< Command > >` (p. 2421), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2421), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2448), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2448).

```

6.145.3.2  template<typename E> virtual bool decaf::util::Collection<
            E >::addAll (const Collection< E > & collection) throw
            ( lang::exceptions::UnsupportedOperationException,
              lang::exceptions::IllegalArgumentException,
              lang::exceptions::IllegalStateException ) [pure
              virtual]

```

Adds all of the elements in the specified collection to this collection. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters:

collection - **Collection** (p. 871) whose elements are added to this one.

Returns:

true if this collection changed as a result of the call

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

```

6.145.3.3  template<typename E> virtual void decaf::util::Collection< E >::clear
            () throw ( lang::exceptions::UnsupportedOperationException ) [pure
            virtual]

```

Removes all of the elements from this collection (optional operation). This collection will be empty after this method returns unless it throws an exception.

Exceptions:

UnsupportedOperationException

Implemented in **decaf::util::AbstractCollection< E >** (p. 127), **decaf::util::AbstractQueue< E >** (p. 138), **decaf::util::StlList< E >** (p. 2423), **decaf::util::StlSet< E >** (p. 2449), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 127), **decaf::util::AbstractCollection< CompositeTask * >** (p. 127), **decaf::util::AbstractCollection< URI >** (p. 127), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 127), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 127), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 127), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 127), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 127), **decaf::util::StlList< CompositeTask * >** (p. 2423), **decaf::util::StlList< URI >** (p. 2423), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 2423), **decaf::util::StlList< PrimitiveValueNode >** (p. 2423), **decaf::util::StlList< Pointer< Command > >** (p. 2423), **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2423), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2449), and **decaf::util::StlSet< ActiveMQSession * >** (p. 2449).

6.145.3.4 `template<typename E> virtual bool decaf::util::Collection< E >::contains (const E & value) const throw (lang::Exception)` [pure virtual]

Returns true if this collection contains the specified element. More formally, returns true if and only if this collection contains at least one element *e* such that (*o*==null ? *e*==null : *o.equals(e)*).

Parameters:

value - value to check for presence in the collection

Returns:

true if there is at least one of the elements in the collection

Exceptions:

Exception

Implemented in `decaf::util::AbstractCollection< E >` (p.127), `decaf::util::StlList< E >` (p.2423), `decaf::util::StlSet< E >` (p.2450), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p.127), `decaf::util::AbstractCollection< CompositeTask * >` (p.127), `decaf::util::AbstractCollection< URI >` (p.127), `decaf::util::AbstractCollection< ActiveMQSession * >` (p.127), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p.127), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p.127), `decaf::util::AbstractCollection< Pointer< Command > >` (p.127), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p.127), `decaf::util::StlList< CompositeTask * >` (p.2423), `decaf::util::StlList< URI >` (p.2423), `decaf::util::StlList< Pointer< DestinationInfo > >` (p.2423), `decaf::util::StlList< PrimitiveValueNode >` (p.2423), `decaf::util::StlList< Pointer< Command > >` (p.2423), `decaf::util::StlList< Pointer< BackupTransport > >` (p.2423), `decaf::util::StlSet< Pointer< Synchronization > >` (p.2450), and `decaf::util::StlSet< ActiveMQSession * >` (p.2450).

6.145.3.5 `template<typename E> virtual bool decaf::util::Collection< E >::containsAll (const Collection< E > & collection) const throw (lang::Exception)` [pure virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters:

collection - `Collection` (p.871) to compare to this one.

Exceptions:

Exception

6.145.3.6 `template<typename E> virtual bool decaf::util::Collection< E >::equals (const Collection< E > & value) const` [pure virtual]

Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.

Returns:

true if the Collections contain the same elements.

Implemented in `decaf::util::StlList< E >` (p. 2424), and `decaf::util::StlSet< E >` (p. 2450).

6.145.3.7 `template<typename E> virtual bool decaf::util::Collection< E >::isEmpty () const` [pure virtual]

Returns:

true if this collection contains no elements.

Implemented in `decaf::util::AbstractCollection< E >` (p. 129), `decaf::util::StlList< E >` (p. 2425), `decaf::util::StlSet< E >` (p. 2450), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 129), `decaf::util::AbstractCollection< CompositeTask * >` (p. 129), `decaf::util::AbstractCollection< URI >` (p. 129), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 129), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 129), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 129), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 129), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 129), `decaf::util::StlList< CompositeTask * >` (p. 2425), `decaf::util::StlList< URI >` (p. 2425), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2425), `decaf::util::StlList< PrimitiveValueNode >` (p. 2425), `decaf::util::StlList< Pointer< Command > >` (p. 2425), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2425), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2450), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2450).

6.145.3.8 `template<typename E> virtual bool decaf::util::Collection< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)` [pure virtual]

Removes a single instance of the specified element from the collection. More formally, removes an element *e* such that (*o*==null ? *e*==null : *o*.equals(*e*)), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters:

value - reference to the element to remove.

Returns:

true if the collection was changed

Exceptions:

UnsupportedOperationException
IllegalArgumentException

Implemented in `decaf::util::AbstractCollection< E >` (p. 130), `decaf::util::StlList< E >` (p. 2427), `decaf::util::StlSet< E >` (p. 2451), `decaf::util::AbstractCollection<`

Pointer< Synchronization > > (p. 130), decaf::util::AbstractCollection< CompositeTask * > (p. 130), decaf::util::AbstractCollection< URI > (p. 130), decaf::util::AbstractCollection< ActiveMQSession * > (p. 130), decaf::util::AbstractCollection< Pointer< DestinationInfo > > (p. 130), decaf::util::AbstractCollection< PrimitiveValueNode > (p. 130), decaf::util::AbstractCollection< Pointer< Command > > (p. 130), decaf::util::AbstractCollection< Pointer< BackupTransport > > (p. 130), decaf::util::StlList< CompositeTask * > (p. 2427), decaf::util::StlList< URI > (p. 2427), decaf::util::StlList< Pointer< DestinationInfo > > (p. 2427), decaf::util::StlList< PrimitiveValueNode > (p. 2427), decaf::util::StlList< Pointer< Command > > (p. 2427), decaf::util::StlList< Pointer< BackupTransport > > (p. 2427), decaf::util::StlSet< Pointer< Synchronization > > (p. 2451), and decaf::util::StlSet< ActiveMQSession * > (p. 2451).

6.145.3.9 `template<typename E> virtual bool decaf::util::Collection< E >::removeAll (const Collection< E > & collection)
 throw (lang::exceptions::UnsupportedOperationException,
 lang::exceptions::IllegalArgumentException) [pure virtual]`

Removes all this collection's elements that are also contained in the specified collection (optional operation). After this call returns, this collection will contain no elements in common with the specified collection.

Parameters:

collection - The **Collection** (p. 871) whose elements are to be removed

Returns:

true if the collection changed as a result of this call

Exceptions:

UnsupportedOperationException

IllegalArgumentException

6.145.3.10 `template<typename E> virtual bool decaf::util::Collection< E >::retainAll (const Collection< E > & collection)
 throw (lang::exceptions::UnsupportedOperationException,
 lang::exceptions::IllegalArgumentException) [pure virtual]`

Retains only the elements in this collection that are contained in the specified collection (optional operation). In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters:

collection - The **Collection** (p. 871) whose elements are to be retained

Returns:

true if the collection changed as a result of this call

Exceptions:*UnsupportedOperationException**IllegalArgumentException*

6.145.3.11 `template<typename E> virtual std::size_t decaf::util::Collection< E >::size () const [pure virtual]`

Returns the number of elements in this collection. If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns:

the number of elements in this collection

Implemented in `decaf::util::StlList< E >` (p. 2428), `decaf::util::StlSet< E >` (p. 2451), `decaf::util::StlList< CompositeTask * >` (p. 2428), `decaf::util::StlList< URI >` (p. 2428), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2428), `decaf::util::StlList< PrimitiveValueNode >` (p. 2428), `decaf::util::StlList< Pointer< Command > >` (p. 2428), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2428), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2451), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2451).

Referenced by `decaf::util::AbstractCollection< Pointer< BackupTransport > >::equals()`, `decaf::util::AbstractCollection< Pointer< BackupTransport > >::isEmpty()`, `decaf::util::AbstractSet< ActiveMQSession * >::removeAll()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::toArray()`.

6.145.3.12 `template<typename E> virtual std::vector<E> decaf::util::Collection< E >::toArray () const [pure virtual]`

Returns an array containing all of the elements in this collection. If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns:

an array of the elements in this collection.

Implemented in `decaf::util::AbstractCollection< E >` (p. 132), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 132), `decaf::util::AbstractCollection< CompositeTask * >` (p. 132), `decaf::util::AbstractCollection< URI >` (p. 132), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 132), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 132), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 132), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 132), and `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 132).

The documentation for this class was generated from the following file:

6.146.1 Constructor & Destructor Documentation

6.146.1.1 `virtual activemq::commands::Command::~~Command () [inline, virtual]`

6.146.2 Member Function Documentation

6.146.2.1 `virtual int activemq::commands::Command::getCommandId () const [pure virtual]`

Gets the **Command** (p. 879) Id of this **Message** (p. 1737).

Returns:

Command (p. 879) Id

Implemented in **activemq::commands::BaseCommand** (p. 509).

6.146.2.2 `virtual bool activemq::commands::Command::isBrokerInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 509), and **activemq::commands::BrokerInfo** (p. 611).

6.146.2.3 `virtual bool activemq::commands::Command::isConnectionInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 510), and **activemq::commands::ConnectionInfo** (p. 1000).

6.146.2.4 `virtual bool activemq::commands::Command::isConsumerInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 510), and **activemq::commands::ConsumerInfo** (p. 1066).

6.146.2.5 `virtual bool activemq::commands::Command::isKeepAliveInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 510), and **activemq::commands::KeepAliveInfo** (p. 1557).

6.146.2.6 `virtual bool activemq::commands::Command::isMessage () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 510), and **activemq::commands::Message** (p. 1747).

6.146.2.7 `virtual bool activemq::commands::Command::isMessageAck () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 510), and `activemq::commands::MessageAck` (p. 1780).

6.146.2.8 `virtual bool activemq::commands::Command::isMessageDispatch () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 510), and `activemq::commands::MessageDispatch` (p. 1803).

6.146.2.9 `virtual bool activemq::commands::Command::isMessageDispatchNotification () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 510), and `activemq::commands::MessageDispatchNotification` (p. 1826).

6.146.2.10 `virtual bool activemq::commands::Command::isProducerAck () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 511), and `activemq::commands::ProducerAck` (p. 2088).

6.146.2.11 `virtual bool activemq::commands::Command::isProducerInfo () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 511), and `activemq::commands::ProducerInfo` (p. 2125).

6.146.2.12 `virtual bool activemq::commands::Command::isRemoveInfo () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 511), and `activemq::commands::RemoveInfo` (p. 2179).

6.146.2.13 `virtual bool activemq::commands::Command::isRemoveSubscriptionInfo () const` [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 511), and `activemq::commands::RemoveSubscriptionInfo` (p. 2196).

6.146.2.14 `virtual bool activemq::commands::Command::isResponse () const` [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 511), and `activemq::commands::Response` (p. 2233).

6.146.2.15 `virtual bool activemq::commands::Command::isResponseRequired () const [pure virtual]`

Is a **Response** (p. 2231) required for this **Command** (p. 879).

Returns:

true if a response is required.

Implemented in **activemq::commands::BaseCommand** (p. 511).

6.146.2.16 `virtual bool activemq::commands::Command::isShutdownInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 511), and **activemq::commands::ShutdownInfo** (p. 2351).

6.146.2.17 `virtual bool activemq::commands::Command::isTransactionInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 512), and **activemq::commands::TransactionInfo** (p. 2591).

6.146.2.18 `virtual bool activemq::commands::Command::isWireFormatInfo () const [pure virtual]`

Implemented in **activemq::commands::BaseCommand** (p. 512), and **activemq::commands::WireFormatInfo** (p. 2706).

6.146.2.19 `virtual void activemq::commands::Command::setCommandId (int id) [pure virtual]`

Sets the **Command** (p. 879) Id of this **Message** (p. 1737).

Parameters:

id **Command** (p. 879) Id

Implemented in **activemq::commands::BaseCommand** (p. 512).

6.146.2.20 `virtual void activemq::commands::Command::setResponseRequired (const bool required) [pure virtual]`

Set if this **Message** (p. 1737) requires a **Response** (p. 2231).

Parameters:

required true if response is required

Implemented in **activemq::commands::BaseCommand** (p. 512).

6.146.2.21 virtual std::string activemq::commands::Command::toString () const [pure virtual]

Returns a provider-specific string that provides information about the contents of the command.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 560).

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 150), `activemq::commands::ActiveMQBytesMessage` (p. 173), `activemq::commands::ActiveMQMapMessage` (p. 266), `activemq::commands::ActiveMQMessage` (p. 281), `activemq::commands::ActiveMQObjectMessage` (p. 312), `activemq::commands::ActiveMQStreamMessage` (p. 382), `activemq::commands::ActiveMQTextMessage` (p. 452), `activemq::commands::BaseCommand` (p. 512), `activemq::commands::BrokerInfo` (p. 612), `activemq::commands::ConnectionControl` (p. 948), `activemq::commands::ConnectionError` (p. 964), `activemq::commands::ConnectionInfo` (p. 1001), `activemq::commands::ConsumerControl` (p. 1031), `activemq::commands::ConsumerInfo` (p. 1067), `activemq::commands::ControlCommand` (p. 1085), `activemq::commands::DataArrayResponse` (p. 1103), `activemq::commands::DataResponse` (p. 1134), `activemq::commands::DestinationInfo` (p. 1197), `activemq::commands::ExceptionResponse` (p. 1278), `activemq::commands::FlushCommand` (p. 1359), `activemq::commands::IntegerResponse` (p. 1444), `activemq::commands::KeepAliveInfo` (p. 1557), `activemq::commands::Message` (p. 1749), `activemq::commands::MessageAck` (p. 1781), `activemq::commands::MessageDispatch` (p. 1803), `activemq::commands::MessageDispatchNotification` (p. 1827), `activemq::commands::MessagePull` (p. 1896), `activemq::commands::ProducerAck` (p. 2088), `activemq::commands::ProducerInfo` (p. 2125), `activemq::commands::RemoveInfo` (p. 2179), `activemq::commands::RemoveSubscriptionInfo` (p. 2196), `activemq::commands::ReplayCommand` (p. 2212), `activemq::commands::Response` (p. 2233), `activemq::commands::SessionInfo` (p. 2302), `activemq::commands::ShutdownInfo` (p. 2351), `activemq::commands::TransactionInfo` (p. 2592), and `activemq::commands::WireFormatInfo` (p. 2708).

6.146.2.22 virtual decaf::lang::Pointer<commands::Command> activemq::commands::Command::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [pure virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implemented in `activemq::commands::BrokerError` (p. 589), `activemq::commands::BrokerInfo` (p. 613), `activemq::commands::ConnectionControl` (p. 948), `activemq::commands::ConnectionError` (p. 965), `activemq::commands::ConnectionInfo` (p. 1001), `activemq::commands::ConsumerControl` (p. 1032), `activemq::commands::ConsumerInfo` (p. 1068), `activemq::commands::ControlCommand` (p. 1085), `activemq::commands::DestinationInfo` (p. 1197), `activemq::commands::FlushCommand` (p. 1359), `activemq::commands::KeepAliveInfo` (p. 1557), `activemq::commands::Message` (p. 1750), `activemq::commands::MessageAck` (p. 1781), `activemq::commands::MessageDispatch`

(p. 1804), **activemq::commands::MessageDispatchNotification**
(p. 1827), **activemq::commands::MessagePull** (p. 1896), **ac-**
tivemq::commands::ProducerAck (p. 2089), **activemq::commands::ProducerInfo**
(p. 2126), **activemq::commands::RemoveInfo** (p. 2179), **ac-**

6.147.1 Detailed Description

Interface for an Object that can visit the various Command Objects that are sent from and to this client. The Commands themselves implement a **visit** method that is called with an instance of this interface and each one then call the appropriate **processXXX** method.

6.149 decaf::lang::Comparable< T > Class Template Reference

This interface imposes a total ordering on the objects of each class that implements it.

```
#include <src/main/decaf/lang/Comparable.h>
```

Public Member Functions

- virtual **~Comparable** ()
- virtual int **compareTo** (const T &value) const =0
Compares this object with the specified object for order.
- virtual bool **equals** (const T &value) const =0
- virtual bool **operator==** (const T &value) const =0
Compares equality between this object and the one passed.
- virtual bool **operator<** (const T &value) const =0
Compares this object to another and returns true if this object is considered to be less than the one passed.

6.149.1 Detailed Description

```
template<typename T> class decaf::lang::Comparable< T >
```

This interface imposes a total ordering on the objects of each class that implements it. This ordering is referred to as the class's natural ordering, and the class's compareTo method is referred to as its natural comparison method.

6.149.2 Constructor & Destructor Documentation

6.149.2.1 `template<typename T> virtual decaf::lang::Comparable< T >::~~Comparable () [inline, virtual]`

6.149.3 Member Function Documentation

6.149.3.1 `template<typename T> virtual int decaf::lang::Comparable< T >::compareTo (const T & value) const [pure virtual]`

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all x and y. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementer must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all `z`.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the **Comparable** (p. 899) interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Implemented in **decaf::lang::Boolean** (p. 574), **decaf::lang::Byte** (p. 666), **decaf::lang::Character** (p. 803), **decaf::lang::Double** (p. 1234), **decaf::lang::Float** (p. 1331), **decaf::lang::Integer** (p. 1431), **decaf::lang::Long** (p. 1655), and **decaf::lang::Short** (p. 2323).

6.149.3.2 `template<typename T> virtual bool decaf::lang::Comparable< T >::equals (const T & value) const` [pure virtual]

Returns:

true if this value is considered equal to the passed value.

Implemented in **decaf::lang::Boolean** (p. 575), **decaf::lang::Byte** (p. 667), **decaf::lang::Character** (p. 804), **decaf::lang::Double** (p. 1236), **decaf::lang::Float** (p. 1332), **decaf::lang::Integer** (p. 1432), **decaf::lang::Long** (p. 1656), and **decaf::lang::Short** (p. 2324).

6.149.3.3 `template<typename T> virtual bool decaf::lang::Comparable< T >::operator< (const T & value) const` [pure virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implemented in **decaf::lang::Boolean** (p. 575), **decaf::lang::Byte** (p. 668), **decaf::lang::Character** (p. 806), **decaf::lang::Double** (p. 1238), **decaf::lang::Float** (p. 1334), **decaf::lang::Integer** (p. 1435), **decaf::lang::Long** (p. 1659), and **decaf::lang::Short** (p. 2325).

6.149.3.4 `template<typename T> virtual bool decaf::lang::Comparable< T >::operator==(const T & value) const` [pure virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implemented in **decaf::lang::Boolean** (p. 576), **decaf::lang::Byte** (p. 669), **decaf::lang::Character** (p. 806), **decaf::lang::Double** (p. 1238), **decaf::lang::Float** (p. 1335), **decaf::lang::Integer** (p. 1435), **decaf::lang::Long** (p. 1659), and **decaf::lang::Short** (p. 2326).

6.150 decaf::util::Comparator< T > Class Template Reference

A comparison function, which imposes a total ordering on some collection of objects.

```
#include <src/main/decaf/util/Comparator.h>
```

Public Member Functions

- virtual **~Comparator** ()
- virtual bool **operator**() (const T &left, const T &right) const =0
*Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 902) to be passed to an STL **Map** (p. 1689) for use as the sorting criteria.*
- virtual int **compare** (const T &o1, const T &o2) const =0
Compares its two arguments for order.

6.150.1 Detailed Description

```
template<typename T> class decaf::util::Comparator< T >
```

A comparison function, which imposes a total ordering on some collection of objects. Comparators can be passed to a sort method (such as Collections.sort) to allow precise control over the sort order. Comparators can also be used to control the order of certain data structures.

The ordering imposed by a **Comparator** (p. 902) c on a set of elements S is said to be consistent with equals if and only if (compare(e1, e2) == 0) has the same boolean value as (e1 == e2) for every e1 and e2 in S.

6.150.2 Constructor & Destructor Documentation

6.150.2.1 template<typename T> virtual decaf::util::Comparator< T
 >::~Comparator () [inline, virtual]

6.150.3 Member Function Documentation

6.150.3.1 template<typename T> virtual int decaf::util::Comparator< T
 >::compare (const T & o1, const T & o2) const [pure virtual]

Compares its two arguments for order. Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that `sgn(compare(x, y)) == -sgn(compare(y, x))` for all x and y. (This implies that `compare(x, y)` must throw an exception if and only if `compare(y, x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `((compare(x, y)>0) && (compare(y, z)>0))` implies `compare(x, z)>0`.

Finally, the implementer must ensure that `compare(x, y)==0` implies that `sgn(compare(x, z))==sgn(compare(y, z))` for all z.

It is generally the case, but not strictly required that `(compare(x, y)==0) == (x == y)`. Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters:

- o1* - the first object to be compared
- o2* - the second object to be compared

Returns:

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

6.150.3.2 `template<typename T> virtual bool decaf::util::Comparator< T >::operator() (const T & left, const T & right) const` [pure virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p.902) to be passed to an STL **Map** (p.1689) for use as the sorting criteria.

Parameters:

- left* - the Left hand side operand.
- right* - the Right hand side operand.

Returns:

true if the value of left is less than the value of right.

*Indicates whether this task has any pending work that needs to be done, if not then it is skipped and the next **Task** (p. 2520) in the `CompositeTaskRunner`'s list of tasks is checked, if none of the tasks have any pending work to do, then the runner can go to sleep until it awakened by a call to `wakeup`.*

6.152.1 Detailed Description

Represents a single task that can be part of a set of Tasks that are contained in a `CompositeTaskRunner` (p. 908).

Since:

3.0

6.152.2 Constructor & Destructor Documentation

6.152.2.1 virtual `activemq::threads::CompositeTask::~~CompositeTask ()` [inline, virtual]

6.152.3 Member Function Documentation

6.152.3.1 virtual `bool activemq::threads::CompositeTask::isPending () const` [pure virtual]

Indicates whether this task has any pending work that needs to be done, if not then it is skipped and the next **Task** (p. 2520) in the `CompositeTaskRunner`'s list of tasks is checked, if none of the tasks have any pending work to do, then the runner can go to sleep until it awakened by a call to `wakeup`.

Since:

3.0

Implemented in `activemq::transport::failover::BackupTransportPool` (p. 505), `activemq::transport::failover::CloseTransportsTask` (p. 841), and `activemq::transport::failover::FailoverTransport` (p. 1302).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/CompositeTask.h`

6.153 activemq::threads::CompositeTaskRunner Class Reference

A **Task** (p. 2520) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.

#include <src/main/activemq/threads/CompositeTaskRunner.h> Inheritance diagram for activemq::threads::CompositeTaskRunner:

Public Member Functions

- **CompositeTaskRunner** ()
- virtual **~CompositeTaskRunner** ()
- void **addTask** (CompositeTask *task)
*Adds a new **CompositeTask** (p. 906) to the Set of Tasks that this class manages.*
- void **removeTask** (CompositeTask *task)
*Removes a **CompositeTask** (p. 906) that was added previously.*
- virtual void **shutdown** (unsigned int timeout)
Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()
Shutdown once the task has finished and the TaskRunner's thread has exited.
- virtual void **wakeup** ()
*Signal the **TaskRunner** (p. 2522) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2520) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()
Run method - called by the Thread class in the context of the thread.
- virtual bool **iterate** ()
Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.153.1 Detailed Description

A **Task** (p. 2520) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.

Since:

3.0

6.153.2 Constructor & Destructor Documentation

6.153.2.1 `activemq::threads::CompositeTaskRunner::CompositeTaskRunner ()`

6.153.2.2 `virtual
activemq::threads::CompositeTaskRunner::~~CompositeTaskRunner ()
[virtual]`

6.153.3 Member Function Documentation

6.153.3.1 `void activemq::threads::CompositeTaskRunner::addTask (CompositeTask
* task)`

Adds a new **CompositeTask** (p. 906) to the Set of Tasks that this class manages.

Parameters:

task - Pointer to a **CompositeTask** (p. 906) instance.

6.153.3.2 `virtual bool activemq::threads::CompositeTaskRunner::iterate ()
[protected, virtual]`

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns:

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implements **activemq::threads::Task** (p. 2520).

6.153.3.3 `void activemq::threads::CompositeTaskRunner::removeTask
(CompositeTask * task)`

Removes a **CompositeTask** (p. 906) that was added previously.

Parameters:

task - Pointer to a **CompositeTask** (p. 906) instance.

6.153.3.4 `virtual void activemq::threads::CompositeTaskRunner::run ()
[protected, virtual]`

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2256).

6.153.3.5 `virtual void activemq::threads::CompositeTaskRunner::shutdown ()
[virtual]`

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implements **activemq::threads::TaskRunner** (p. 2522).

6.153.3.6 **virtual void activemq::threads::CompositeTaskRunner::shutdown**
 (unsigned int *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters:

timeout - Time in Milliseconds to wait for the task to stop.

Implements **activemq::threads::TaskRunner** (p. 2522).

6.153.3.7 **virtual void activemq::threads::CompositeTaskRunner::wakeup ()**
 [virtual]

Signal the **TaskRunner** (p. 2522) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2520) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 2523).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**CompositeTaskRunner.h**

6.154 activemq::transport::CompositeTransport Class Reference

A Composite **Transport** (p. 2608) is a **Transport** (p. 2608) implementation that is composed of several Transports.

#include <src/main/activemq/transport/CompositeTransport.h> Inheritance diagram for activemq::transport::CompositeTransport:

Public Member Functions

- virtual **~CompositeTransport** ()
- virtual void **addURI** (const **List**< **URI** > &uris)=0
*Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2608) is a composite of.*
- virtual void **removeURI** (const **List**< **URI** > &uris)=0
*Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2608) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2608) should result in that **Transport** (p. 2608) being disposed of.*

6.154.1 Detailed Description

A Composite **Transport** (p. 2608) is a **Transport** (p. 2608) implementation that is composed of several Transports. The composition could be such that only one **Transport** (p. 2608) exists for each URI that is composed or there could be many active Transports working at once.

Since:

3.0

6.154.2 Constructor & Destructor Documentation

- 6.154.2.1 virtual **activemq::transport::CompositeTransport::~~CompositeTransport** () [inline, virtual]

6.154.3 Member Function Documentation

- 6.154.3.1 virtual void **activemq::transport::CompositeTransport::addURI** (const **List**< **URI** > & *uris*) [pure virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2608) is a composite of.

Parameters:

uris The new URI set to add to the set this composite maintains.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1299).

6.154.3.2 `virtual void activemq::transport::CompositeTransport::removeURI (const List< URI > & uris) [pure virtual]`

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2608) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2608) should result in that **Transport** (p. 2608) being disposed of.

Parameters:

uris The new URI set to remove to the set this composite maintains.

Implemented in `activemq::transport::failover::FailoverTransport` (p. 1303).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/CompositeTransport.h`

6.155 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR > Class Template Reference

Interface for a **Map** (p. 1689) type that provides additional **atomic** (p. 118) `putIfAbsent`, `remove`, and `replace` methods alongside the already available **Map** (p. 1689) interface.

#include <src/main/decaf/util/concurrent/ConcurrentMap.h> Inheritance diagram for decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >:

Public Member Functions

- virtual `~ConcurrentMap()`
- virtual `bool putIfAbsent (const K &key, const V &value)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)`

If the specified key is not already associated with a value, associate it with the given value.

- virtual `bool remove (const K &key, const V &value)=0`

Remove entry for key only if currently mapped to given value.

- virtual `bool replace (const K &key, const V &oldValue, const V &newValue)=0`

Replace entry for key only if currently mapped to given value.

- virtual `V replace (const K &key, const V &value)=0 throw (decaf::lang::exceptions::NoSuchElementException)`

Replace entry for key only if currently mapped to some value.

6.155.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR> class
decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >
```

Interface for a **Map** (p. 1689) type that provides additional **atomic** (p. 118) `putIfAbsent`, `remove`, and `replace` methods alongside the already available **Map** (p. 1689) interface.

Since:

1.0

6.155.2 Constructor & Destructor Documentation

6.155.2.1 `template<typename K, typename V, typename COMPARATOR>
virtual decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR
>::~ConcurrentMap () [inline, virtual]`

6.155.3 Member Function Documentation

6.155.3.1 `template<typename K, typename V, typename COMPARATOR>
virtual bool decaf::util::concurrent::ConcurrentMap< K, V,
COMPARATOR >::putIfAbsent (const K & key, const V & value)
throw (decaf::lang::exceptions::UnsupportedOperationException) [pure
virtual]`

If the specified key is not already associated with a value, associate it with the given value. This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key The key to map the value to.

value The value to map to the given key.

Returns:

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions:

UnsupportedOperationException if the put operation is not supported by this map

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 927), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 927), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 927).

6.155.3.2 `template<typename K, typename V, typename COMPARATOR> virtual
bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR
>::remove (const K & key, const V & value) [pure virtual]`

Remove entry for key only if currently mapped to given value. Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == value ) ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value associated with the specified key.

Returns:

true if the value was removed, false otherwise

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 928), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 928), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 928), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 928), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 928), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 928), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 928).

6.155.3.3 `template<typename K, typename V, typename COMPARATOR>
virtual V decaf::util::concurrent::ConcurrentMap< K, V,
COMPARATOR >::replace (const K & key, const V & value) throw (
decaf::lang::exceptions::NoSuchElementException) [pure virtual]`

Replace entry for key only if currently mapped to some value. Acts as

```
if( ( map.containsKey( key ) ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException(...);
};
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value to be associated with the specified key.

Returns:

copy of the previous value associated with specified key, or throws an `NoSuchElementException` if there was no mapping for key.

Exceptions:

NoSuchElementException if there was no previous mapping.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 929), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 929), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 929), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 929), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 929), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 929), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 929).

6.155.3.4 `template<typename K, typename V, typename COMPARATOR> virtual bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::replace (const K & key, const V & oldValue, const V & newValue) [pure virtual]`

Replace entry for key only if currently mapped to given value. Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

oldValue value expected to be associated with the specified key.

newValue value to be associated with the specified key.

Returns:

true if the value was replaced

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 930), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 930), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 930), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 930), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 930), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 930), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 930).

The documentation for this class was generated from the following file:

6.156 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference

Map (p.1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

#include <src/main/decaf/util/concurrent/ConcurrentStlMap.h> Inheritance diagram for decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >:

Public Member Functions

- **ConcurrentStlMap** ()
Default constructor - does nothing.
- **ConcurrentStlMap** (const **ConcurrentStlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **ConcurrentStlMap** (const **Map**< K, V, COMPARATOR > &source)
Copy constructor - copies the content of the given map into this one.
- virtual ~**ConcurrentStlMap** ()
- virtual bool **equals** (const **ConcurrentStlMap** &source) const
Comparison, equality is dependent on the method of determining if the element are equal.
Parameters:
source - **Map** (p.1689) to compare to this one.
Returns:
*true if the **Map** (p.1689) passed is equal in value to this one.*
- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const
- virtual void **copy** (const **ConcurrentStlMap** &source)
Copies the content of the source map into this map.
Erases all existing data in this map.
Parameters:
source The source object to copy from.
- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)
- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
Exceptions:
UnsupportedOperationException if this map is unmodifiable.
- virtual bool **containsKey** (const K &key) const
Indicates whether or this map contains a value for the given key.
Parameters:
key The key to look up.
Returns:
true if this map contains the value, otherwise false.

- virtual bool **containsValue** (const V &value) const
Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.
Parameters:
value The Value to look up.
Returns:
true if this map contains the value, otherwise false.
- virtual bool **isEmpty** () const
Returns:
*if the **Map** (p. 1689) contains any element or not, TRUE or FALSE*
- virtual std::size_t **size** () const
Returns:
The number of elements (key/value pairs) in this map.
- virtual V & **get** (const K &key) throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 1689).
If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*
Parameters:
key The search key.
Returns:
A reference to the value for the given key.
Exceptions:
***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 1689).*
- virtual const V & **get** (const K &key) const throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 1689).
If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*
Parameters:
key The search key.
Returns:
A {const} reference to the value for the given key.
Exceptions:
***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 1689).*
- virtual void **put** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)
Sets the value for the specified key.
Parameters:
key The target key.
value The value to be set.
Exceptions:
***UnsupportedOperationException** if this map is unmodifiable.*

- virtual void **putAll** (const **ConcurrentStlMap**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

*Stores a copy of the Mappings contained in the other **Map** (p. 1689) in this one.*

Parameters:

*other A **Map** (p. 1689) instance whose elements are to all be inserted in this **Map** (p. 1689).*

Exceptions:

UnsupportedOperationException *If the implementing class does not support the putAll operation.*

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

- virtual V **remove** (const K &key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters:

key The search key.

Returns:

a copy of the element that was previously mapped to the given key

Exceptions:

NoSuchElementException *if this key is not in the **Map** (p. 1689).*
UnsupportedOperationException *if this map is unmodifiable.*

- virtual std::vector< K > **keySet** () const

*Returns a **Set** (p. 2320) view of the mappings contained in this map.*

*The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1490), **Set.remove** (p. 130), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.*

Returns:

the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () const

Returns:

the entire set of values in this map as a std::vector.

- bool **putIfAbsent** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

If the specified key is not already associated with a value, associate it with the given value.

- bool **remove** (const K &key, const V &value)

Remove entry for key only if currently mapped to given value.

- bool **replace** (const K &key, const V &oldValue, const V &newValue)

Replace entry for key only if currently mapped to given value.

- V **replace** (const K &key, const V &value) throw (decaf::lang::exceptions::NoSuchElementException)

Replace entry for key only if currently mapped to some value.

- virtual void **lock** () throw (lang::Exception)

Locks the object.

- virtual void **unlock** () throw (lang::Exception)

Unlocks the object.

- virtual void **wait** () throw (lang::Exception)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (unsigned long millisecs) throw (lang::Exception)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (lang::Exception)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (lang::Exception)

Signals the waiters on this object that it can now wake up and continue.

6.156.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>>
 class decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >

Map (p.1689) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map. This version of **Map** (p.1689) extends the **ConcurrentMap** (p.913) interface and implements all the methods defined in that interface. Unlike a Java ConcurrentHashMap this implementations synchronizes all methods such that any call to this class will block if another thread is already holding a lock, much like the Java HashTable.

Since:

1.0

6.156.2 Constructor & Destructor Documentation

6.156.2.1 template<typename K, typename V, typename COMPARATOR
 = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V,
 COMPARATOR >::ConcurrentStlMap () [inline]

Default constructor - does nothing.

6.156.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap (const ConcurrentStlMap< K, V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.156.2.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap (const Map< K, V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.156.2.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::~~ConcurrentStlMap () [inline, virtual]`

6.156.3 Member Function Documentation

6.156.3.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::clear () throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes all keys and values from this map.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1690).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy()`.

6.156.3.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::containsKey (const K & key) const [inline, virtual]`

Indicates whether or this map contains a value for the given key.

Parameters:

key The key to look up.

Returns:

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1691).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::remove(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace().

6.156.3.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::containsValue (const V & value) const [inline, virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters:

value The Value to look up.

Returns:

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1692).

6.156.3.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & source) [inline, virtual]`

6.156.3.5 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::copy (const ConcurrentStlMap< K, V, COMPARATOR > & source) [inline, virtual]`

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters:

source The source object to copy from.

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 1693).

Referenced by **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ProducerId** >, **Pointer**< **ProducerState** >, **ProducerId::COMPARATOR** >::**ConcurrentStlMap**().

6.156.3.6 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & source) const [inline, virtual]`

6.156.3.7 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const ConcurrentStlMap< K, V, COMPARATOR > & source) const [inline, virtual]`

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters:

source - **Map** (p. 1689) to compare to this one.

Returns:

true if the **Map** (p. 1689) passed is equal in value to this one.

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 1693).

6.156.3.8 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::get (const K & key) const throw (lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the **Map** (p. 1689).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** is thrown.

Parameters:

key The search key.

Returns:

A {const} reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1689).

Implements **decaf::util::Map**< **K**, **V**, **COMPARATOR** > (p. 1693).

6.156.3.9 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual V& decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::get (const K & key) throw (
 lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the **Map** (p. 1689).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters:

key The search key.

Returns:

A reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1689).

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1694).

6.156.3.10 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::isEmpty () const [inline, virtual]`

Returns:

if the **Map** (p. 1689) contains any element or not, TRUE or FALSE

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1695).

6.156.3.11 `template<typename K, typename V, typename
 COMPARATOR = std::less<K>> virtual std::vector<K>
 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
 >::keySet () const [inline, virtual]`

Returns a **Set** (p. 2320) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the `setValue` operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1490), **Set.remove** (p. 130), `removeAll`, `retainAll` and `clear` operations. It does not support the `add` or `addAll` operations.

Returns:

the entire set of keys in this map as a `std::vector`.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1696).

6.156.3.12 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<K, V, COMPARATOR >::lock () throw (lang::Exception) [inline, virtual]`

Locks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2508).

6.156.3.13 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<K, V, COMPARATOR >::notify () throw (lang::Exception) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2510).

6.156.3.14 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<K, V, COMPARATOR >::notifyAll () throw (lang::Exception) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2511).

6.156.3.15 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<K, V, COMPARATOR >::put (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Sets the value for the specified key.

Parameters:

key The target key.

value The value to be set.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1697).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace().

- 6.156.3.16** `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`
- 6.156.3.17** `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putAll (const ConcurrentStlMap< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 1689) in this one.

Parameters:

other A **Map** (p. 1689) instance whose elements are to all be inserted in this **Map** (p. 1689).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1697).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy().

- 6.156.3.18** `template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putIfAbsent (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

If the specified key is not already associated with a value, associate it with the given value. This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
```

```

        return false;
    }

```

except that the action is performed atomically.

Parameters:

key The key to map the value to.

value The value to map to the given key.

Returns:

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions:

UnsupportedOperationException if the put operation is not supported by this map

Implements `decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >` (p. 914).

6.156.3.19 `template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::remove (const K & key, const V & value) [inline, virtual]`

Remove entry for key only if currently mapped to given value. Acts as

```

if( map.containsKey( key ) && ( map.get( key ) == value ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}

```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value associated with the specified key.

Returns:

true if the value was removed, false otherwise

Implements `decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >` (p. 915).

6.156.3.20 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual V decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::remove (const K & key)
 throw (decaf::lang::exceptions::NoSuchElementException,
 decaf::lang::exceptions::UnsupportedOperationException) [inline,
 virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters:

key The search key.

Returns:

a copy of the element that was previously mapped to the given key

Exceptions:

NoSuchElementException if this key is not in the **Map** (p. 1689).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1698).

6.156.3.21 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> V decaf::util::concurrent::ConcurrentStlMap< K, V,
 COMPARATOR >::replace (const K & key, const V & value) throw (
 decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Replace entry for key only if currently mapped to some value. Acts as

```
if( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException(...);
};
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

value value to be associated with the specified key.

Returns:

copy of the previous value associated with specified key, or throws an *NoSuchElementException* if there was no mapping for key.

Exceptions:

NoSuchElementException if there was no previous mapping.

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 915).

6.156.3.22 `template<typename K, typename V, typename COMPARTOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARTOR >::replace (const K & key, const V & oldValue, const V & newValue) [inline, virtual]`

Replace entry for key only if currently mapped to given value. Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters:

key key with which the specified value is associated.

oldValue value expected to be associated with the specified key.

newValue value to be associated with the specified key.

Returns:

true if the value was replaced

Implements `decaf::util::concurrent::ConcurrentMap< K, V, COMPARTOR >` (p. 916).

6.156.3.23 `template<typename K, typename V, typename COMPARTOR = std::less<K>> virtual std::size_t decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARTOR >::size () const [inline, virtual]`

Returns:

The number of elements (key/value pairs) in this map.

Implements `decaf::util::Map< K, V, COMPARTOR >` (p. 1699).

6.156.3.24 `template<typename K, typename V, typename COMPARTOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARTOR >::unlock () throw (lang::Exception) [inline, virtual]`

Unlocks the object.

Exceptions:

Exception

Implements `decaf::util::concurrent::Synchronizable` (p. 2512).

6.156.3.25 `template<typename K, typename V, typename
 COMPARATOR = std::less<K>> virtual std::vector<V>
 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
 >::values () const [inline, virtual]`

Returns:

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1700).

Referenced by **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::values()**.

6.156.3.26 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::wait (unsigned long milliseconds) throw (
 lang::Exception) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2513).

6.156.3.27 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::wait () throw (lang::Exception) [inline,
 virtual]`

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

Exception

Implements **decaf::util::concurrent::Synchronizable** (p. 2514).

- virtual void **signal** ()=0
Wakes up one waiting thread.
- virtual void **signalAll** ()=0
Wakes up all waiting threads.

6.157.1 Detailed Description

Condition (p. 932) factors out the **Mutex** (p. 1921) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1618) implementations. Where a **Lock** (p. 1618) replaces the use of synchronized statements, a **Condition** (p. 932) replaces the use of the Object monitor methods.

Conditions (also known as condition queues or condition variables) provide a means for one thread to suspend execution (to "wait") until notified by another thread that some state condition may now be true. Because access to this shared state information occurs in different threads, it must be protected, so a lock of some form is associated with the condition. The key property that waiting

for a condition provides is that it atomically releases the associated lock and suspends the current thread.

A **Condition** (p. 932) instance is intrinsically bound to a lock. To obtain a **Condition** (p. 932) instance for a particular **Lock** (p. 1618) instance use its `newCondition()` method.

As an example, suppose we have a bounded buffer which supports put and take methods. If a take is attempted on an empty buffer, then the thread will block until an item becomes available; if a put is attempted on a full buffer, then the thread will block until a space becomes available. We would like to keep waiting put threads and take threads in separate wait-sets so that we can use the optimization of only notifying a single thread at a time when items or spaces become available in the buffer. This can be achieved using two **Condition** (p. 932) instances.

```
class BoundedBuffer { Lock* lock = new ReentrantLock(); Condition* notFull = lock->newCondition(); Condition* notEmpty = lock->newCondition();
```

```
Object* items = new Object[100]; int putptr, takeptr, count;
```

```
public void put( Object* x ) throw( InterruptedException ) { lock->lock(); try { while( count == 100 ) notFull->await() (p. 934); items[putptr] = x; if (++putptr == 100) putptr = 0; ++count; notEmpty->signal() (p. 937); } catch(...) { lock->unlock(); } }
```

```
public Object take() throw( InterruptedException ) { lock->lock(); try { while(count == 0) notEmpty->await() (p. 934); Object x = items[takeptr]; if (++takeptr == 100) takeptr = 0; --count; notFull->signal() (p. 937); return x; } catch(...) { lock->unlock(); } }
```

(The `ArrayBlockingQueue` class provides this functionality, so there is no reason to implement this sample usage class.)

Implementation Considerations

When waiting upon a **Condition** (p. 932), a "spurious wakeup" is permitted to occur, in general, as a concession to the underlying platform semantics. This has little practical impact on most application programs as a **Condition** (p. 932) should always be waited upon in a loop, testing the state predicate that is being waited for. An implementation is free to remove the possibility of spurious wakeups but it is recommended that applications programmers always assume that they can occur and so always wait in a loop.

The three forms of condition waiting (interruptible, non-interruptible, and timed) may differ in their ease of implementation on some platforms and in their performance characteristics. In particular, it may be difficult to provide these features and maintain specific semantics such as ordering guarantees. Further, the ability to interrupt the actual suspension of the thread may not always be feasible to implement on all platforms.

Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of waiting, nor is it required to support interruption of the actual suspension of the thread.

An implementation is required to clearly document the semantics and guarantees provided by each of the waiting methods, and when an implementation does support interruption of thread suspension then it must obey the interruption semantics as defined in this interface.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since:

1.0

6.157.2 Constructor & Destructor Documentation

6.157.2.1 `virtual decaf::util::concurrent::locks::Condition::~~Condition () [inline, virtual]`

6.157.3 Member Function Documentation

6.157.3.1 `virtual bool decaf::util::concurrent::locks::Condition::await (long long time, const TimeUnit & unit) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]`

Causes the current thread to wait until it is signalled or interrupted, or the specified waiting time elapses. This method is behaviorally equivalent to:

```
awaitNanos(unit.toNanos(time)) > 0
```

Parameters:

time - the maximum time to wait

unit - the time unit of the time argument

Returns:

false if the waiting time detectably elapsed before return from the method, else true

Exceptions:

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

6.157.3.2 `virtual void decaf::util::concurrent::locks::Condition::await () throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]`

Causes the current thread to wait until it is signalled or interrupted. The lock associated with this **Condition** (p. 932) is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

- * Some other thread invokes the **signal()** (p. 937) method for this **Condition** (p. 932) and the current thread happens to be chosen as the thread to be awakened; or
- * Some other thread invokes the **signalAll()** (p. 937) method for this **Condition** (p. 932); or
- * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or
- * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while waiting and interruption of thread suspension is supported,

then **InterruptedException** is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 932) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as `IllegalMonitorStateException`) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal. In that case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Exceptions:

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

```
6.157.3.3  virtual long long decaf::util::concurrent::locks::Condition::awaitNanos
            (long long nanosTimeout) throw ( de-
            caf::lang::exceptions::InterruptedException,
            decaf::lang::exceptions::IllegalMonitorStateException )
            [pure virtual]
```

Causes the current thread to wait until it is signalled or interrupted, or the specified waiting time elapses. The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of five things happens:

* Some other thread invokes the **signal()** (p. 937) method for this **Condition** (p. 932) and the current thread happens to be chosen as the thread to be awakened; or * Some other thread invokes the **signalAll()** (p. 937) method for this **Condition** (p. 932); or * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or * The specified waiting time elapses; or * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting and interruption of thread suspension is supported,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

The method returns an estimate of the number of nanoseconds remaining to wait given the supplied `nanosTimeout` value upon return, or a value less than or equal to zero if it timed out. This value can be used to determine whether and how long to re-wait in cases where the wait returns but an awaited condition still does not hold. Typical uses of this method take the following form:

```
synchronized boolean aMethod( long timeout, const TimeUnit& unit ) { long nanosTimeout =
unit.toNanos(timeout); while (!conditionBeingWaitedFor) { if (nanosTimeout > 0) nanosTimeout
= theCondition->awaitNanos(nanosTimeout); else return false; } // ... }
```

Design note: This method requires a nanosecond argument so as to avoid truncation errors in reporting remaining times. Such precision loss would make it difficult for programmers to ensure that total waiting times are not systematically shorter than specified when re-waits occur.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 932) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as `IllegalMonitorStateException`) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal, or over indicating the elapse of the specified waiting time. In either case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Parameters:

nanosTimeout - the maximum time to wait, in nanoseconds

Returns:

an estimate of the `nanosTimeout` value minus the time spent waiting upon return from this method. A positive value may be used as the argument to a subsequent call to this method to finish waiting out the desired time. A value less than or equal to zero indicates that no time remains.

Exceptions:

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

6.157.3.4 virtual void decaf::util::concurrent::locks::Condition::awaitUninterruptibly () throw (decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Causes the current thread to wait until it is signalled. The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * Some other thread invokes the **signal()** (p. 937) method for this **Condition** (p. 932) and the current thread happens to be chosen as the thread to be awakened; or
- * Some other thread invokes the **signalAll()** (p. 937) method for this **Condition** (p. 932); or
- * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread's interrupted status is set when it enters this method, or it is interrupted while waiting, it will continue to wait until signalled. When it finally returns from this method its interrupted status will still be set.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 932) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as `IllegalMonitorStateException`) and the implementation must document that fact.

Exceptions:

IllegalMonitorStateException if the caller is not the lock owner.

6.157.3.5 virtual void decaf::util::concurrent::locks::Condition::signal () [pure virtual]

Wakes up one waiting thread. If any threads are waiting on this condition then one is selected for waking up. That thread must then re-acquire the lock before returning from await.

6.157.3.6 virtual void decaf::util::concurrent::locks::Condition::signalAll () [pure virtual]

Wakes up all waiting threads. If any threads are waiting on this condition then they are all woken up. Each thread must re-acquire the lock before it can return from await.

6.158.1.1 decaf::net::ConnectException::ConnectException () throw () [inline]

Default Constructor.

6.158.1.2 decaf::net::ConnectException::ConnectException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.158.1.3 decaf::net::ConnectException::ConnectException (const ConnectException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.158.1.4 decaf::net::ConnectException::ConnectException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.158.1.5 decaf::net::ConnectException::ConnectException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.158.1.6 decaf::net::ConnectException::ConnectException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.158.1.7 `virtual decaf::net::ConnectException::~~ConnectException () throw ()`
[inline, virtual]

6.158.2 Member Function Documentation

6.158.2.1 `virtual ConnectException* decaf::net::ConnectException::clone () const`
[inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2380).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ConnectException.h`

6.159 cms::Connection Class Reference

- virtual **ExceptionListener** * **getExceptionListener** () const =0
Gets the registered Exception Listener for this connection.
- virtual void **setExceptionListener** (**ExceptionListener** *listener)=0
Sets the registered Exception Listener for this connection.

6.159.1 Detailed Description

The client's connection to its provider. Connections support concurrent use.

A connection serves several purposes:

- It encapsulates an open connection with a JMS provider. It typically represents an open TCP/IP socket between a client and the service provider software.
- Its creation is where client authentication takes place.
- It can specify a unique client identifier.
- It provides a **ConnectionMetaData** (p. 1015) object.
- It supports an optional **ExceptionListener** (p. 1275) object.

Because the creation of a connection involves setting up authentication and communication, a connection is a relatively heavy-weight object. Most clients will do all their messaging with a single connection. Other more advanced applications may use several connections. The CMS API does not architect a reason for using multiple connections; however, there may be operational reasons for doing so.

A CMS client typically creates a connection, one or more sessions, and a number of message producers and consumers. When a connection is created, it is in stopped mode. That means that no messages are being delivered.

It is typical to leave the connection in stopped mode until setup is complete (that is, until all message consumers have been created). At that point, the client calls the connection's start method, and messages begin arriving at the connection's consumers. This setup convention minimizes any client confusion that may result from asynchronous message delivery while the client is still in the process of setting itself up.

A connection can be started immediately, and the setup can be done afterwards. Clients that do this must be prepared to handle asynchronous message delivery while they are still in the process of setting up.

A message producer can send messages while a connection is stopped.

Since:

6.159.2.1 `virtual cms::Connection::~~Connection () [inline, virtual]`

6.159.3 Member Function Documentation

6.159.3.1 `virtual void cms::Connection::close () throw (CMSException) [pure virtual]`

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions:

CMSException (p. 850)

Implements `cms::Closeable` (p. 838).

Implemented in `activemq::core::ActiveMQConnection` (p. 193).

6.159.3.2 `virtual Session* cms::Connection::createSession (Session::AcknowledgeMode ackMode) throw (CMSException) [pure virtual]`

Creates a new **Session** (p. 2270) to work for this **Connection** (p. 941) using the specified acknowledgment mode.

Parameters:

ackMode the Acknowledgment Mode to use.

Exceptions:

CMSEException (p. 850)

Implemented in **activemq::core::ActiveMQConnection** (p. 193).

6.159.3.3 `virtual Session* cms::Connection::createSession () throw (CMSEException) [pure virtual]`

Creates an AUTO_ACKNOWLEDGE Session (p. 2270).

Exceptions:

CMSEException (p. 850)

Implemented in **activemq::core::ActiveMQConnection** (p. 194).

6.159.3.4 `virtual std::string cms::Connection::getClientID () const [pure virtual]`

Get the Client Id for this session.

Returns:

Client Id String

Implemented in **activemq::core::ActiveMQConnection** (p. 195).

6.159.3.5 `virtual ExceptionListener* cms::Connection::getExceptionListener () const [pure virtual]`

Gets the registered Exception Listener for this connection.

Returns:

pointer to an exception listener or NULL

Implemented in **activemq::core::ActiveMQConnection** (p. 196).

6.159.3.6 `virtual const ConnectionMetaData* cms::Connection::getMetaData () const throw (CMSEException) [pure virtual]`

Gets the metadata for this connection.

Returns:

the connection MetaData pointer (caller does not own it).

Exceptions:

CMSEException (p. 850) if the provider fails to get the connection metadata for this connection.

See also:

ConnectionMetaData (p. 1015)

Since:

2.0

Implemented in **activemq::core::ActiveMQConnection** (p. 196).

6.159.3.7 **virtual void cms::Connection::setExceptionListener** (**ExceptionListener ***
listener) [pure virtual]

Sets the registered Exception Listener for this connection.

Parameters:

listener pointer to and ExceptionListener (p. 1275)

Implemented in **activemq::core::ActiveMQConnection** (p. 198).

6.160.2.1 **virtual ConnectionControl*** **activemq::commands::ConnectionControl::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1174).

6.160.2.2 **virtual void** **activemq::commands::ConnectionControl::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.160.2.3 virtual bool activemq::commands::ConnectionControl::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 508).

6.160.2.4 virtual unsigned char activemq::commands::ConnectionControl::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.160.2.12 `virtual void activemq::commands::ConnectionControl::setExit (bool`
`exit) [virtual]`
- 6.160.2.13 `virtual void activemq::commands::ConnectionControl::setFaultTolerant`
`(bool faultTolerant) [virtual]`
- 6.160.2.14 `virtual void activemq::commands::ConnectionControl::setResume (bool`
`resume) [virtual]`
- 6.160.2.15 `virtual void activemq::commands::ConnectionControl::setSuspend (bool`
`suspend) [virtual]`
- 6.160.2.16 `virtual std::string activemq::commands::ConnectionControl::toString ()`
`const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p.512).

- 6.160.2.17 `virtual Pointer<Command> activemq::commands::ConnectionControl::visit`
`(activemq::state::CommandVisitor * visitor) throw (`
`exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 883).

6.160.3 Field Documentation

6.161.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p. 950). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.161.2 Constructor & Destructor Documentation

6.161.2.1 `activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::ConnectionControlMarshaller()` `[inline]`

6.161.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::~~ConnectionControlMarshaller()` `[inline, virtual]`

6.161.3 Member Function Documentation

6.161.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.161.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.161.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.161.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.161.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.161.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.161.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

The documentation for this class was generated from the following file:

6.162.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p. 954). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.162.2 Constructor & Destructor Documentation

6.162.2.1 `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::ConnectionControlMarshaller()` [inline]

6.162.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::~~ConnectionControlMarshaller()` [inline, virtual]

6.162.3 Member Function Documentation

6.162.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.162.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.162.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.162.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.162.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.162.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.162.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

The documentation for this class was generated from the following file:

6.163.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p. 958). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.163.2 Constructor & Destructor Documentation

6.163.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::ConnectionControlMarshaller()` `[inline]`

6.163.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::~~ConnectionControlMarshaller()` `[inline, virtual]`

6.163.3 Member Function Documentation

6.163.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.163.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.163.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.163.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.163.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.163.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.163.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/ConnectionControlMarshaller.h

- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_CONNECTIONERROR** = 16

Protected Member Functions

- **ConnectionError** (const **ConnectionError** &)
- **ConnectionError** & **operator=** (const **ConnectionError** &)

Protected Attributes

- `Pointer< BrokerError > exception`
- `Pointer< ConnectionId > connectionId`

6.164.1 Constructor & Destructor Documentation

6.164.1.1 `activemq::commands::ConnectionError::ConnectionError (const ConnectionError &) [inline, protected]`

6.164.1.2 `activemq::commands::ConnectionError::ConnectionError ()`

6.164.1.3 `virtual activemq::commands::ConnectionError::~~ConnectionError () [virtual]`

6.164.2 Member Function Documentation

6.164.2.1 `virtual ConnectionError* activemq::commands::ConnectionError::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.164.2.2 `virtual void activemq::commands::ConnectionError::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

6.164.2.3 `virtual bool activemq::commands::ConnectionError::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 508).

- 6.164.2.4 `virtual Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId ()`
[virtual]
- 6.164.2.5 `virtual const Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId ()`
const [virtual]
- 6.164.2.6 `virtual unsigned char activemq::commands::ConnectionError::getDataStructureType () const`
[virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

- 6.164.2.7 `virtual Pointer<BrokerError>& activemq::commands::ConnectionError::getException ()`
[virtual]
- 6.164.2.8 `virtual const Pointer<BrokerError>& activemq::commands::ConnectionError::getException ()`
const [virtual]
- 6.164.2.9 `ConnectionError& activemq::commands::ConnectionError::operator=`
(const ConnectionError &) [inline, protected]
- 6.164.2.10 `virtual void activemq::commands::ConnectionError::setConnectionId`
(const Pointer< ConnectionId > & *connectionId*) [virtual]
- 6.164.2.11 `virtual void activemq::commands::ConnectionError::setException (const`
Pointer< BrokerError > & *exception*) [virtual]
- 6.164.2.12 `virtual std::string activemq::commands::ConnectionError::toString ()`
const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 512).

6.164.2.13 `virtual Pointer<Command> activemq::commands::ConnectionError::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2231) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 883).

6.164.3 Field Documentation

6.164.3.1 `Pointer<ConnectionId> activemq::commands::ConnectionError::connectionId [protected]`

6.164.3.2 `Pointer<BrokerError> activemq::commands::ConnectionError::exception [protected]`

6.164.3.3 `const unsigned char activemq::commands::ConnectionError::ID _ - CONNECTIONERROR = 16 [static]`

The documentation for this class was generated from the following file:

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.165.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p.966). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.165.2 Constructor & Destructor Documentation

6.165.2.1 `activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::ConnectionErrorMarshaller()` [inline]

6.165.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::~~ConnectionErrorMarshaller()` [inline, virtual]

6.165.3 Member Function Documentation

6.165.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.165.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.165.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 515).

6.165.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 516).

6.165.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 517).

6.165.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 518).

6.165.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 519).

6.166.3 Member Function Documentation

6.166.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.166.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.166.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 522).

6.166.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 523).

6.166.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 524).

6.166.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 525).

6.166.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 526).

Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p.974). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.167.2 Constructor & Destructor Documentation

6.167.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::ConnectionErrorMarshaller()` [inline]

6.167.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::~~ConnectionErrorMarshaller()` [inline, virtual]

6.167.3 Member Function Documentation

6.167.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.167.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.167.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 529).

6.167.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 530).

6.167.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 531).

6.167.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 532).

6.167.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 533).

6.168 cms::ConnectionFactory Class Reference

Defines the interface for a factory that creates connection objects, the **Connection** (p. 941) objects returned implement the CMS **Connection** (p. 941) interface and hide the CMS Provider specific implementation details behind that interface.

```
#include <src/main/cms/ConnectionFactory.h>Inheritance          diagram          for
cms::ConnectionFactory:
```

Public Member Functions

- virtual **~ConnectionFactory** ()
- virtual **Connection** * **createConnection** ()=0 throw (CMSEException)
Creates a connection with the default user identity.
- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password)=0 throw (cms::CMSEException)
Creates a connection with the default specified identity.
- virtual **cms::Connection** * **createConnection** (const std::string &username, const std::string &password, const std::string &clientId)=0 throw (cms::CMSEException)
Creates a connection with the specified user identity.

Static Public Member Functions

- static **ConnectionFactory** * **createCMSConnectionFactory** (const std::string &brokerURI) throw (cms::CMSEException)
Static method that is used to create a provider specific connection factory.

6.168.1 Detailed Description

Defines the interface for a factory that creates connection objects, the **Connection** (p. 941) objects returned implement the CMS **Connection** (p. 941) interface and hide the CMS Provider specific implementation details behind that interface. A Client creates a new **ConnectionFactory** (p. 978) either directly by instantiating the provider specific implementation of the factory or by using the static method **createCMSConnectionFactory** which all providers are required to implement.

Since:

1.0

6.168.2 Constructor & Destructor Documentation

6.168.2.1 `virtual cms::ConnectionFactory::~~ConnectionFactory () [inline, virtual]`

6.168.3 Member Function Documentation

6.168.3.1 `static ConnectionFactory* cms::ConnectionFactory::createCMSConnectionFactory (const std::string & brokerURI) throw (cms::CMSException) [static]`

Static method that is used to create a provider specific connection factory. The provider implements this method in their library and returns an instance of a **ConnectionFactory** (p.978) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

Parameters:

brokerURI The remote address to use to connect to the Provider.

Returns:

A pointer to a provider specific implementation of the **ConnectionFactory** (p.978) interface, the caller is responsible for deleting this resource.

Exceptions:

CMSException (p. 850) if an internal error occurs while creating the **ConnectionFactory** (p.978).

6.168.3.2 `virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & username, const std::string & password, const std::string & clientId) throw (cms::CMSException) [pure virtual]`

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p.2413) method is explicitly called. The user name and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username The user name used to authenticate with the Provider.

password The password used to authenticate with the Provider.

clientId The Client Id assigned to connection. If the id is the empty string ("") then a random client Id is created for this connection.

Returns:

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions:

CMSException (p. 850) if an internal error occurs while creating the **Connection** (p.941).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 202).

6.168.3.3 `virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & username, const std::string & password) throw (cms::CMSEException)` [pure virtual]

Creates a connection with the default specified identity. The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2413) method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters:

username The user name used to authenticate with the Provider.

password The password used to authenticate with the Provider.

Returns:

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions:

CMSEException (p. 850) if an internal error occurs while creating the **Connection** (p. 941).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 202).

6.168.3.4 `virtual Connection* cms::ConnectionFactory::createConnection () throw (CMSEException)` [pure virtual]

Creates a connection with the default user identity. The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2413) method is explicitly called.

Returns:

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions:

CMSEException (p. 850) if an internal error occurs while creating the **Connection** (p. 941).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 202).

6.169.3 Member Function Documentation

6.169.3.1 `virtual ConnectionId* ac-
tivemq::commands::ConnectionId::cloneDataStructure ()
const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1174).

6.169.3.2 `virtual int activemq::commands::ConnectionId::compareTo (const
ConnectionId & value) const [virtual]`

6.169.3.3 `virtual void activemq::commands::ConnectionId::copyDataStructure
(const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

6.169.3.4 virtual bool activemq::commands::ConnectionId::equals (const ConnectionId & *value*) const [virtual]

6.169.3.5 virtual bool activemq::commands::ConnectionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1174) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

6.169.3.6 virtual unsigned char activemq::commands::ConnectionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1174) type copy.

Implements **activemq::commands::DataStructure** (p. 1176).

6.169.3.7 virtual std::string& activemq::commands::ConnectionId::getValue () [virtual]

6.169.3.8 virtual const std::string& activemq::commands::ConnectionId::getValue () const [virtual]

6.169.3.9 virtual bool activemq::commands::ConnectionId::operator< (const ConnectionId & *value*) const [virtual]

6.169.3.10 ConnectionId& activemq::commands::ConnectionId::operator= (const ConnectionId & *other*)

6.169.3.11 virtual bool activemq::commands::ConnectionId::operator== (const ConnectionId & *value*) const [virtual]

6.169.3.12 virtual void activemq::commands::ConnectionId::setValue (const std::string & *value*) [virtual]

6.169.3.13 virtual std::string activemq::commands::ConnectionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1174) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 560).

6.169.4 Field Documentation

6.169.4.1 `const unsigned char activemq::commands::ConnectionId::ID_ -
CONNECTIONID = 120` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

6.169.4.2 `std::string activemq::commands::ConnectionId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ConnectionId.h`

6.170 activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 985).

Write a object instance to data output stream.

6.170.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 985). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.170.2 Constructor & Destructor Documentation

6.170.2.1 `activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::ConnectionIdMarshaller()` [inline]

6.170.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::~~ConnectionIdMarshaller()` [inline, virtual]

6.170.3 Member Function Documentation

6.170.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1148).

6.170.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1151).

6.170.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1154).

6.170.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1158).

6.170.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the `marshal` (p. 76).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1162).

6.170.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the **marshal** (p. 76).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1166).

6.170.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1169).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/ConnectionIdMarshaller.h

6.171 activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 989).
